Reports on single-mode microoptic wavelength division multiplexing (WDM) devices with two channels located at 1275 and 1345 nm, respectively. Data are presented for four multiplexers and four demultiplexers. The average insertion loss for the multiplexers was 0.5 ± 0.2 and 1.0 ± 0.3 dB for the short and long wavelength channels, respectively. For the demultiplexers, the average losses were 0.8 ± 0.2 dB and 1.0 ± 0.1 dB, respectively. The full channel widths of the demultiplexers for 0.5 dB of additional loss were about 22 nm. All measurements included the presence of prototype precision single-mode connectors. The multiplexers were based on interference filters and GRIN lenses with identical single-mode fibers used for inputs and output. The demultiplexers employed diffraction gratings and GRIN lenses with 50- μ m core graded-index fibers. In addition three of the demultiplexers included a third output channel centered at 1521 nm. The 28-dB dynamic range of the monochromatic-based test apparatus was insufficient to evaluate the crosstalk performance. Measurements on two demultiplexers, using a 1295-nm laser, yielded values of -33 and -38 dB, respectively for the crosstalk in the 1345-nm channel. (7 refs.)

113149 A guided-wave optical arbiter circuit. N.Shimizu, M.Ikeda, M.Imase, K.Okada, T.Kimura (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.424-9 (June 1983).

An optical waveguide circuit which can be used as an arbiter for priority allocation in data communication system is proposed. The waveguide circuit was fabricated by silica deposition and its basic performance as an arbiter was measured. The average insertion loss and the crosstalk level for a 10-port

circuit was measured to be 9.8 and -26.8 dB, respectively. In obtaining a large number of fan-out on a compact substrate, it is important to provide a large refractive-index difference between the core and cladding to allow for a sharp bend and to decrease the excess branching loss. The number of fan-out of about 250 is expected on a 50-mm-square substrate. (5 refs.)

113150 A high resolution bar code reader. H.Burkett (Consumer Products Group, Texas Instruments Inc., Lubbock, TX, USA), G.Frazier. *IEEE Trans. Consum. Electron. (USA)*, vol.CE-29, no.3, p.443-9 (1983). (1983 IEEE International Conference on Consumer Electronics. ICCE, Des Plaines, IL, USA, 8-10 June 1983).

Discusses the development of an optical 'wand' which is capable of very dense bar code reading. This wand was initially used in conjunction with a speaking learning aid. The simple interface can provide for an analog or digital output. The electronic components used in the readhead are an IR LED and a phototransistor. (no refs.)

(for optical waveguides see also 42.80L)

113151 Some results and problems in integrated-optics developments. A.M.Goncharenko. *J. Appl. Spectrosc. (USA)*, vol.37, no.6, p.1400-5 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.965-71 (Dec. 1982). [received: Sept. 1983]

Integrated optics is concerned with the generation, propagation, and different types of conversion and detection of light waves in thin-film waveguide devices. The practical purpose of integrated optics is to design optical arrangements similar in their functional possibilities to existing electronic integrated circuits based on semiconductors. The information carrier in integrated optics is light (photons). This ensures a high speed of response and a considerable bandwidth, noise immunity, and certain other advantages compared with electronic devices. The author presents some results and points out the problems that still need to be solved in this new area of science. (33 refs.)

113152 Optical switching characteristics in slightly nondegenerated multilayered couplers using acousto-optic interaction by surface acoustic waves. N.Goto (Faculty of Engng., Nagoya Univ., Nagoya, Japan), Y.Miyazaki, Y.Akao. *Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan)*, vol.E66, no.7, p.442-9 (July 1983).

Experiments of acousto-optic interaction in integrated optics slightly non-degenerated couplers are firstly demonstrated with comparison to the theoretical results. The switching mechanism is based on the even-odd mode conversion by acousto-optic effects and on the probe splitting in the separating branch. The device consists of ZnS/Ta₂O₃/Nb₂O₅ thin films on Y-cut LiNbO₃ substrates with propagation in the X direction. Surface acoustic waves of approximately 0.5 W, 71.2 MHz switch optical power about 90 percent. The frequency characteristics agree well with the theoretical results. These experiment characteristics may give the design base of useful tunable optical filters and multiwavelength separators. (15 refs.)

42.85 OPTICAL TESTING AND WORKSHOP TECHNIQUES

113153 Laser alignment of parallel mechanical axes 10 metres apart. G.F.Marshall, C.L.Taylor (Dept. of Optics, Energy Conversion Devices Inc., Troy, MI, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.207-10 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

A technique using a laser to align the parallelism of a nest of rotational axes or surfaces 10 metres apart to within one-half arc minute is described. (no refs.)

113154 ALPD (axial lateral plasma deposition): a new process for the production of high quality optical fibers. D.Boucher, B.Wurrier, P.Aldebert, V.Neuman, P.Ripoche (Fibres Optiques Industries, Pithiviers, France). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.395-400 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

A quasi-continuous process for production of large core low-loss step index all-silica fibers has been developed by combining axial plasma deposition and lateral plasma deposition. Named ALPD (axial lateral plasma deposition), this process allows industrial production of 2 db/km fibers (0.85 micron) which is almost equivalent to the loss limit of silica fibers estimated from the characteristics of intrinsic infrared absorption and Rayleigh scattering losses. Furthermore thanks to the pure fused silica core these fibers show an excellent radiation hardness and high power throughput capability. (15 refs.)

113155 Diamond flycut multifaceted mirror. S.M.Allen, M.J.Stanich (IBM Corp., Armonk, NY, USA). *IBM Tech. Disclosure Bull. (USA)*, vol.26, no.2, p.559-60 (July 1983).

Describes a manufacturing technique for machining optical surfaces on a multifaceted mirror by offsetting the flycutter from the center of the facet to angle any resulting tool marks. (no refs.)

113156 Optical waveguide manufacturing techniques. M.G.Blankenship (Optical Waveguide Technol., Corning Glass Works, Corning, NY, USA). Southcon/81 Conference Record, Atlanta, GA, USA, 13-15 Jan. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.16-2/1-5

Several manufacturing techniques are currently in use for fabricating high quality glass optical waveguide fibers. The total process can be divided into four major process areas as follows: materials preparation, glass (or preform) making, drawing/coating of fiber and testing/characterization. The author deals primarily with the glass making and drawing steps. The glass making tends to be the controlling process step and the leading technologies for this are the vapor deposition processes and the direct melt process. The vapor and deposition processes include outside vapor deposition, axial vapor deposition and inside vapor deposition. Fiber drawing/coating for high silica vapor deposited preforms utilizes high temperature radiant sources whereas fibers are directly drawn from the lower temperature double crucible processes. Polymer coatings are typically applied during fiber drawing to protect the glass fiber from abrasion and loss inducing microbending. (28 refs.)

113157 The production of optical fibers and optical fiber cables. B.K.Tariyal, J.G.Wright, R.Iyengar (Western Electric Co., Norcross, GA, USA).

Southcon/81 Conference Record, Atlanta, GA, USA, 13-15 Jan. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.16-3/1-12

Optical fibers and cables constitute the transmission media through which light travels in an optical communication system. Low loss and high strength optical fibers with a high bandwidth are essential to the economic viability of a system. The authors describe the production methods for optical fiber and optical fiber cables. Special emphasis is given to the factors which affect the performance of the fibers and the cables, in particular, their mechanical reliability. The processes described are the Western Electric processes as currently practiced. However, development work continues on all aspects of fiber and cable production and will result in continuing changes. (17 refs.)

113158 On the determination of the acoustical characteristics of absorbent materials. V.Legeay, R.Seznec (Lab. Central des Ponts et Chaussées, Paris, France).

Acustica (Germany), vol.53, no.4, p.171-92 (Aug. 1983). In French.

This article presents a method for determining a reflection coefficient of sound waves incident normally or obliquely at a plane interface. Only the modulus of the reflection coefficients is evaluated through the spectra of the incident and reflected waves; its phase is determined as a result of the splitting-up of the modulus by the calculation of natural logarithm of its Hilbert transformation. The reason for this procedure depends on the properties of linear systems at minimal dephasing. The various steps of the calculations are presented: the discrete Hilbert transformation of the amplitudes, extrapolation of the modulus and final verification of the hypothesis of minimal dephasing. The principle interest of this method is the avoidance of defining a phase reference plane, a hazardous definition notably in the case of the surface of a ground with vegetation. An application of this method of characterising the acoustic properties of industrial absorbing materials is described, as well as the application to the determination of the specific impedance of sandy ground or of closely cut grass. (14 refs.)

113159 'Bimorph' ultrasonic wave guides. M.Touratier (ENSAM, Paris, France).

Int. J. Eng. Sci. (GB), vol.21, no.12, p.1411-36 (1983). In French.

An analysis of the dispersion of elastic waves is presented for two types of long ultrasonic wave-guides that are termed 'bimorph': (i) a 'three-layer' guide made of two different materials and (ii) a 'clad core' guide built up of a rectangular core surrounded by a cladding, the materials of the rod and cladding having different properties. An analytical model is proposed to describe the extensional, flexural and torsional motions in 'bimorph' wave guides having two geometrical and material symmetry axes. The asymptotic behaviour of the model allows one to select the material properties which lead to modes guided essentially either in the central layer or in the core of the bimorph guide. Moreover, the dispersive properties of a 'bimorph' can be controlled through the choice of geometrical and material parameters. (14 refs.)

113160 Supersaturation of complex-amplitude fluctuations of waves propagating in a random medium. A.R.Wenzel (Naval Ocean Res. & Dev. Activity, NSTL Station, MS, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1021-4 (Sept. 1983).

A theoretical analysis of the wave field radiated by a point source in a one-dimensional random medium is presented. The analysis is based on the

quasi-Rytov method, and includes both multiple forward scatter and multiple backscatter effects. An approximate expression for the mean square of the modulus of the fluctuating part of the complex wave amplitude is derived under conditions of a weakly dissipative medium. For the high-frequency case, this expression shows that the complex-amplitude fluctuations increase relatively rapidly with propagation range until a maximum value (the supersaturation value) is reached, after which they decrease relatively slowly with further increase in range. These results are in qualitative agreement with observations of intensity fluctuations of optical waves propagating in the lower atmosphere. (11 refs.)

113161 Reflection from a boundary with periodic roughness: theory and experiment. A.Jungman, L.Adler (Dept. of Welding Engng., Ohio State Univ., Columbus, OH, USA), J.D.Achenbach, R.Roberts.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1025-32 (Sept. 1983).

Reflection of elastic waves from a traction-free solid-air boundary of periodic sawtooth profile is investigated experimentally and analytically. For an incident plane wave the surface displacements on the profile are computed as the solution of a singular integral equation. The reflected field is subsequently obtained by using an integral representation for the reflected field. Experimental results are presented for the relative amplitude spectrum for reflection from brass-air, perspex-air, and steel-air boundaries. Both the theoretical and the experimental results show that surface resonances of the profile significantly affect the frequency spectrum of the reflected waves. It is shown that the existence of sharp dips in the amplitude spectra of reflected waves can be attributed to destructive interference between direct reflections and reradiation from surface resonance motions. Good agreement is obtained between calculated results and experimental data. (16 refs.)

113162 Single and multiple scattering of elastic waves in two dimensions.

A.H.Shah, K.C.Wong (Dept. of Civil Engng., Univ. of Manitoba, Winnipeg, Manitoba, Canada), S.K.Datta.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1033-43 (Sept. 1983).

In this paper a combined analytical and finite element method is presented for studying diffraction of elastic waves by cylindrical cavities in two dimensions. The method consists of dividing the infinite space into two regions: an interior bounded region containing the cavities and an exterior unbounded region. The interior region is represented by finite elements and wavefunction expansions are used to represent the field in the exterior homogeneous isotropic medium. Numerical results obtained by this method for scattering of plane longitudinal (P) and shear (SV) waves by a circular cylindrical cavity are shown to be in agreement with the exact solution. The method is then applied to problems of single scattering by triangular and square shaped cavities. Finally, multiple scattering by two circular, and one circular and one square shaped cavity are solved. (14 refs.)

113163 A new rigorous expansion for the velocity potential of a circular piston source. T.Hasegawa, N.Inoue, K.Matsuzawa (Dept. of Phys., Faculty of Sci., Ehime Univ., Ehime, Japan).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1044-7 (Sept. 1983).

In the case of boundary value problems such as the sound scattering from a sphere placed in the nearfield of a plane piston source, it is sometimes essential to express the velocity potentials in terms of the orthogonal expansion. It is demonstrated in the present work that the Rayleigh surface integral, giving the velocity potential for a plane piston source surrounded by an infinite rigid flange, reduces to a rigorous expansion of the simplest form for a circular piston as series of spherical surface harmonics. The resulting equation is valid for any field points even on the piston surface. Sample calculations made with a microcomputer are presented with three-dimensional and contour plots. (13 refs.)

113164 Acoustic coupling between a pulsating and an oscillating sphere.

W.Thompson, Jr., J.M.Reese (Appl. Res. Lab., Pennsylvania State Univ., State College, PA, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1048-50 (Sept. 1983).

The modification of the radiation impedance load on each of two equal-sized spherical-shaped sources, one vibrating in the pulsating or $n=0$ mode and the other in the oscillating or $n=1$ mode has been calculated. Plots of the normalized resistive and reactive components of the modified radiation impedance are presented as a function of the wavelength size and separation of the two spheres. (5 refs.)

113165 T-matrix approach to study the vibration frequencies of elastic bodies in fluids. B.A.Peterson, V.V.Varadan, V.K.Varadan (Dept. of Engng. Mech., Ohio State Univ., Columbus, OH, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1051-6 (Sept. 1983).

The T matrix or null field method is used as a computational scheme for analyzing the scattering frequencies of a homogeneous elastic body in a fluid. These frequencies have a unique distribution, in the complex plane, for each body. The authors solve a scalar transcendental equation to find the scattering frequencies for a sphere. These frequencies are used as starting points in a matrix approach to find the scattering frequencies for a prolate spheroid. Lists and figures of the most important scattering frequencies for a sphere and a prolate spheroid are given. (34 refs.)

113166 Compact sound scatterers with constraints. I.Tolstoy.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1068-70 (Sept. 1983).

Lighthill's method of formulating acoustic scatter allows the explicit introduction of constraints upon the motion of the (small) scatterer. Such constraints can be important in the modeling of rough surfaces by extensions of the Biot technique. (8 refs.)

113167 Comments on 'Kramers-Kronig relationships and wave propagation in composites' by A.I. Beltzer [J. Acoust. Soc. Am. 73, 355 (1983)]. C.M.Sayers (Materials Phys. Div., AERE Harwell, England).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1070-1 (Sept. 1983).

It will be shown that local approximations to the Kramers-Kronig relations are not applicable to scattering systems. (6 refs.)

113168 Comments on 'Dynamics of composites and the K-K relations', a reply to C.M. Sayers. A.I.Beltzer (Holon Technol. Inst., Holon, Israel).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1071-2 (Sept. 1983).

For C.M. Sayers paper see *ibid.*, vol.74, p.1070 (1983). It is shown that the original formulas [J. Acoust. Soc. Am. 73, p.355-6 (1983)] are correct. (12 refs.)

113169 Multiple sound reflections between plane panels covered with reflection coefficients. Y.Sakurai, K.Ishida (Faculty of Engng., Kansai Univ., Osaka, Japan).

J. Acoust. Soc. Jpn. (E) (Japan), vol.4, no.3, p.121-6 (July 1983).

The sound reflection coefficient of a given material, which is measured from a sufficiently large plane of it for spherical wave incidence, has been used previously to predict the first reflection for plane, convex or concave, finite size panels covered with that material. The first reflection of such a panel can be treated as two separate waves. One is the wave from the specular reflection point and the other is a boundary wave comprised of components from the lined point sources at each edge. Here, multiple reflections between two

plane panels covered with materials having reflection coefficients that may be different are approximately calculated from such separate waves as in the same treatment of rigid plane panels. (5 refs.)

113170 The effect of incident pulse width on transient waveform from a circular plate. I.Nakayama, A.Nakamura (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan). *J. Acoust. Soc. Jpn. (E) (Japan)*, vol.4, no.3, p.165-7 (July 1983). The effect of the pulse width on the transient waveform radiated from a clamped circular plate has been examined in the time domain when a plane triangular sound pulse impinges normally on the plate. It has been noted that with increasing the pulse width the initial peak level becomes small and the successive part becomes a simple oscillating waveform with large amplitude. It may be valid that in impulsive sound insulation problems one should direct one's attention to the properties of the incident wave. (3 refs.)

113171 Interior and exterior resonances in acoustic scattering. I. Spherical targets. G.C.Gaunaurd, E.Tanglis, H.Uberall (Naval Surface Weapons Center, White Oak, Silver Spring, MD, USA), D.Brill. *Nuovo Cimento B (Italy)*, vol.76B, ser.2, no.2, p.153-75 (11 Aug. 1983). In acoustic scattering from elastic objects, resonance features appear in the returned echo at frequencies at which the object's eigenfrequencies are located, which are explained by the excitation of interior creeping waves. Corresponding resonance terms may be split off from the total scattering amplitude, leaving behind an apparently nonresonant background amplitude. This is demonstrated for scatterers of spherical geometry and in a companion paper also for scatterers of arbitrary geometry, by using the *T*-matrix approach. For the case of near-impenetrable spheres, it is subsequently shown that the background amplitude can be split further into specularly reflected contributions, plus highly attenuated resonance terms which are explained by the excitation of exterior (Franz-type) creeping waves. The singularity structure of the scattering function is shown mathematically, by using the *R*-matrix approach of the nuclear-scattering theory, as that of a meromorphic function without any additional 'entire function' (as had been postulated by the singularity expansion method). (21 refs.)

113172 Analysis of the elastic field of ultrasonic waves scattered by a cylindrical cavity. N.P.Aleshin, L.Yu.Mogil'ner (N.E. Bauman Moscow Advanced Tech. School, Moscow, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.939-49 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.18-30 (Dec. 1982). [received: Sept. 1983] The scattering of a transverse wave by a lateral cylindrical reflector is investigated. The resultant field is represented by the sum of a specularly reflected field and diffraction fields, where the last are due to the reradiation into the volume of surface waves that are produced at the cylinder. The surface waves may propagate with velocities close to those of longitudinal and transverse waves in the volume. Expressions are derived for the velocities of the surface waves. (17 refs.)

113173 Calculated reflection and transmission of a plane wave at the interface between two liquids with viscosity and thermal conductivity. F.F.Legusha. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.597-8 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1390-2 (Nov. 1982). [received: Sept. 1983] Examines the problem of the transmission of a plane acoustic wave across a plane interface between two immiscible liquids with an arbitrary set of physical parameters. The problem is solved by the Kirchhoff-Konstantinov method. Expressions for the reflection and transmission coefficients are derived. (3 refs.)

113174 A few remarks on the calculation of sound field by the contour-integral method. M.Hirone (Faculty of Engng., Tohoku Univ., Sendai, Japan), Y.Kagawa. *Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan)*, vol.J66A, no.7, p.617-24 (July 1983). In Japanese. Attempts to expand the contour-integral method to three-dimensional problems and to deal with the relation between the division or the integration of the elemental area and the accuracy of the calculation. This report also provided a comparative study of the present method and FEM. In the case of FEM, the accuracy is rapidly lost when the dimension of element/wavelength exceeds settled ratio but its condition is slow in the present method. It is made clear that FEM is not always profitable as compared with CPU time of the present method at higher frequency. (8 refs.)

113175 On the uniqueness of the acoustic boundary-contact problems solution. B.P.Belinsky. *Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR)*, no.3, p.5-10 (July 1983). In Russian. The construction of plates placed in an acoustic medium is considered. The uniqueness of the solution of a stationary acoustic problem for this system is proved. The connection of the uniqueness problem with the simple solvability of a linear system, originating from the problem, is discussed. (12 refs.)

(see also 43.60 Acoustic signal processing; 43.88 Transduction; devices for generation and production of sound)

113176 High-frequency acoustic properties of a fluid/porous solid interface. I. New surface mode. S.Feng, D.L.Johnson (Schlumberger-Doll Res., Ridgefield, CT, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.906-14 (Sept. 1983). The authors use Biot's theory to search numerically for the velocities of the various surface waves, both the true slow surface wave and the pseudosurface waves, at an interface between a fluid half-space and a half-space of a fluid-saturated porous medium. They focus on the high-frequency range where the Biot-Plona slow wave is propagatory. They find that for an open-pore surface situation, the true surface mode exists for a limited range of material

parameters and changes continuously into a slightly leaky pseudo-Stonley mode as the mode speed increases past the slowest bulk wave speed; for the sealed pore situation there exist simultaneously a true surface mode (for all values of material parameters) and a pseudo-Stonley mode. The pseudo-Rayleigh mode has features similar to those of the pseudo-Rayleigh mode for a fluid/nonporous solid case. (23 refs.)

113177 High-frequency acoustic properties of a fluid/porous solid interface. II. The 2D reflection Green's function. S.Feng, D.L.Johnson (Schlumberger-Doll Res., Ridgefield, CT, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.915-24 (Sept. 1983). For pt.1 see *ibid.*, vol.74, p.906 (1983). A 2-D space-time reflection Green's function is developed using the Cagniard-de Hoop technique for a fluid/lossless porous media planar interface configuration. It is then used to study the effects of the various surface waves whose velocities were calculated in the previous article. The time-dependent pressure response to a modeling source signal (Blackman-Harris pulse) for certain simulated experimental configurations is also presented. It is concluded that the amplitude with which the new surface modes are generated are large enough to enable their detection. (12 refs.)

113178 A method for generation of finite amplitude pulse of sinusoidal sound in free space. T.Nakamura, A.Nakamura (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan). *J. Acoust. Soc. Jpn. (E) (Japan)*, vol.4, no.3, p.149-55 (July 1983). Nonlinear response of acoustic materials to a large amplitude sound depends upon the incident waveform itself. For this reason, the authors attempt to control the radiated waveform of finite amplitude in free space. In order to control the radiated waveform, the waveform control in a pipe was performed by the use of a loudspeaker driven by the computed waveform, and the generated wave was radiated from an exponential horn connected to the end of the pipe. However, the observed waveform in free space was different slightly from expected one. As the result of the simulation for the sound transmission through the exponential horn, it became clear that the reflection of the mouth of the horn affected the radiated waveform in free space. Therefore, the waveform control in the pipe was performed by taking account of the effect of the horn and then the result obtained agreed approximately with the waveform expected. (9 refs.)

113179 A method for radiation of a large-amplitude single shock pulse with sharp width into free space. T.Nakamura, A.Nakamura (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan). *J. Acoust. Soc. Jpn. (E) (Japan)*, vol.4, no.3, p.161-3 (July 1983). The authors describe a sound source utilizing actively the waveform distortion due to the nonlinearity in air in order to radiate a sound pulse of sharp width with large amplitude into free space. (4 refs.)

113180 Phase relations for nonlinear acoustic phenomena in media with relaxation. A.D.Nosenko (Dept. of Acoustics, Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.37, no.5, p.118 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.100 (1982). The phase relations in nonlinear acoustic interactions are experimentally investigated. (no refs.)

113181 Self-induced acoustic transparency of dilute paramagnetic crystals. G.T.Adamashvili, L.L.Buishvili, M.D.Zviadadze (State Univ., Tbilisi, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.317-18 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.562-3 (Feb. 1983). [received: Sept. 1983] Describes the interaction of a coherent acoustic pulse with an electron-nuclear spin system of a dilute paramagnetic crystal of cubic symmetry by adopting the following simple model. The authors consider a system of equivalent pairs consisting of an impurity electron spin *S* and a nuclear spin *I* of the host matrix (*S*=1=1/2) subjected to a static magnetic field *H*₀||*z*. Since the impurity concentration is low, the mutual interaction of such pairs can be neglected. (3 refs.)

113182 Note on the axisymmetric sonic jet. J.D.Cole (Dept. of Math. Sci., Rensselaer Polytech. Inst., Troy, NY, USA). *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.944-8 (Aug. 1983). The axisymmetric sonic jet is considered in transonic small disturbance theory. A new hodograph equation is derived from which it can be deduced that there is a local similarity solution describing the final state. From this similarity solution it follows that the uniform sonic state is reached at a finite distance from the orifice. (1 ref.)

43.30 UNDERWATER SOUND (see also 92.10 Physics of the ocean)

113183 The group velocity of normal modes. D.M.F.Chapman, D.D.Ellis (Defence Res. Establ. Atlantic, Dartmouth, Nova Scotia, Canada). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.973-9 (Sept. 1983). A simple, general formula for normal mode group velocities provides an intuitive grasp of the factors influencing group velocity, especially for shallow water environments associated with strong seabed interaction. This is demonstrated using some hypothetical shallow water environments, and by comparing mode shapes at different frequencies. The formula is especially convenient to implement in normal mode computer codes which already perform similar calculations for mode normalization and attenuation coefficients. Using the WKB approximation to the normal mode functions, the formula is identified with the average horizontal speed of the ray equivalent to the mode. For a shallow water environment with bottom interaction, the group velocity formula is shown to include the beam and the time displacement effects of modified ray theory. This result strengthens the ray/mode analogy which is used in analyzing ocean acoustics problems. (20 refs.)

113184 Inverse scattering in a stratified medium. D.C.Stickler (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.994-1005 (Sept. 1983). In this analysis the following problem is considered: A point harmonic source at frequencies ω_1 and ω_2 is located in the region $z < 0$, where the assumption is made that both the sound speed and density profiles are known. For $z > 0$ the sound speed and density profiles are unknown. These two profiles are recovered from a measurement of the pressure field for all *r* at some fixed depth $z < 0$ at the two frequencies. Trace formula methods are used. The following assumptions are needed: First, $c(z)$ and $\rho(z)$ approach c_1, ρ_1 as $z \rightarrow -\infty$, and c_2, ρ_2 as $z \rightarrow +\infty$, and although c_2, ρ_2 are not known, it must be known that $c_2 < c_1$. Second, the angular frequency of the source must be such

that no trapped modes are excited. While the sound speed $c(z)$ can be complex, the limiting values c_1 and c_2 must be real. If $c(z)$ also depends on frequency and the form of the dependence is known, say, $c(z) = c_R(z) + i\omega^{\lambda(z)}c_I(z)$, then $c_R(z)$, $c_I(z)$, and $\lambda(z)$ can be recovered. Explicit expressions are obtained in the realistic case when $c_I(z)$ is not large. If a density is known and $c_I(z) = 0$, then only a measurement at one frequency is required. Two numerical examples are given; in both examples $\rho(z) \equiv 1$ and $c(z)$ is real. The first example is for a monotonically increasing profile and the second has a low velocity zone. Typical sediment parameters are used. (12 refs.)

113185 Scattering of focused ultrasound by spherical microparticles. P.L. Edwards (Univ. of West Florida, Pensacola, FL, USA), J. Jarzynski. *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.1006-12 (Sept. 1983).

The scattering of focused ultrasound in water by three different types of microspheres (25-55 μ m diameter), with $ka < 1$, was studied. The three scatterers were a spherical glass bubble, solid polystyrene spheres and hydrogen bubbles. The measurement arrangement consisted of two transducers (transmitter and receiver) of 1.27-cm diameter with focusing lenses mounted on their faces. They were positioned so that their focal regions overlapped and their axes were 60° apart. A swept frequency ultrasonic signal was used, of 30 μ s duration, in which the frequency increased linearly from 3.5-6.8 MHz. The glass bubble was mounted on a nylon filament and positioned in the overlapping focal regions. The polystyrene spheres were in solution, and reflections were obtained as they drifted through the focal regions. The hydrogen bubbles were generated by electrolysis and reflections obtained as they rose through the focal regions. From the shape of the echo envelope the frequency dependence of the scattered-pressure amplitude was determined for each scatterer, and significant differences were observed between the echoes from the solid scatterers and the gas bubbles. The experiment results are compared with theoretical predictions. (13 refs.)

113186 Nearfield of a large acoustic transducer. II. Parametric radiation. G.S. Garrett (Appl. Res. Labs., Univ. of Texas, Austin, TX, USA), J.N. Tjotta, S. Tjotta.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1013-20 (Sept. 1983). For part I see *ibid.*, vol.72, p.1056 (1982). The transducer is the same as the one considered in an accompanying paper by the same authors [Part I, *J. Acoust. Soc. Am.*, vol.72, 1056-1061 (1982)]. It has a diameter of 182 cm, and is composed of 364 elements, 4.8×6.4 cm each, which are distributed in 13 equally spaced rings. It is used to generate difference frequency sound at 0.5-5 kHz in water. Amplitude and phase of the generated sound are measured at various distances in the nearfield of the transducer. The results are compared with calculations based on the quasilinear approximation of the governing equations. Simplifications are obtained by utilizing the parabolic approximations [J. Naze Tjotta and S. Tjotta, *J. Acoust. Soc. Am.*, 67, 484-490 (1980)]. This also makes it possible to use a realistic model for the primaries (see the accompanying paper) when evaluating the nonlinear source term, such that all effects of the nearfield oscillations in amplitude and phase are fully accounted for. The analytical results obtained also apply to the case of an amplitude and/or phase shaded source. (16 refs.)

113187 Experimental observations of magneto-acoustic fields. P.H. Moose (Dept. of Electrical Engng., Naval Postgraduate School, Monterey, CA, USA), R.F. Klaus.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.1066-8 (Sept. 1983). Experimental observations of electric fields induced in salt water by acoustic waves in a resonant cavity interacting with a strong constant magnetic field are described. The fields are found to behave linearly with the constant magnetic field strength as well as with the acoustic field strength as predicted theoretically. However, the measured electric fields are an order of magnitude greater than predicted by the theory. A similar result has been obtained recently by independent investigators in an open ocean experiment. The discrepancy may be related to the similarity between electromagnetic and acoustic phase velocities in salt water at low frequencies. (5 refs.)

113188 Vibration isolation from irregularity in a nearly periodic structure: theory and measurements. C.H. Hodges, J. Woodhouse (Topexpross Ltd., Cambridge, England).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.894-905 (Sept. 1983). This article describes the theory and a simple experiment carried out to demonstrate the phenomenon of Anderson localization in an acoustical context. This is an effect whereby the propagation of vibration in a structure which is not entirely regular is impeded by the irregularities, giving rise on

the average to an exponential decay of vibration level away from the driving point, even in the absence of any dissipation. The structure used in the experiment was a stretched string with masses attached to it. This string was studied with regular spacings of the masses and after the masses had been moved in a controlled way to provide a small degree of irregularity. In both cases, the transmission of energy from end to end of the string was measured as a function of frequency, and also the mode shapes in the second and fourth passbands were measured so as to demonstrate the underlying physics of the localization phenomenon, in which the individual modes making up each passband change from being extended throughout the structure in the regular case to being localized in specific areas of the structure in the presence of irregularity. All measurements yielded satisfactory agreement with the theoretical predictions. (13 refs.)

113189 Complexity of string vibration estimated from a concept of entropy. K. Imai, K. Kuno, K. Ikegaya (Dept. of Electrical Engng., Nagoya Univ., Nagoya, Japan).

J. Acoust. Soc. Jpn. (E) (Japan), vol.4, no.3, p.127-37 (July 1983). Describes the complexity of the forced vibration of a flexible string, on the basis of the concept analogous to entropy, popular in thermodynamics and communication theory, which the authors have introduced for evaluating the complexity of a reverberant field in a recent paper (see *ibid.*, vol.38, p.461, 1982). The entropy of string vibration is defined in terms of the energy contribution of each normal mode in which the vibration is formulated, and is discussed in connection with the frequency components and location of a driving force and with transient characteristics by a unit impulsive force. As a result, it is found that the entropy increases with an increase in frequency band width of the force and approaches infinity, and that although the driving point varies the entropy according to the band width, it tends to be raised under random excitation. Moreover, in the transient response of the string, the entropy is shown to decrease with time after the excitation. Thus, the entropy employed here represents well the degree of energy distribution in each mode, and within this meaning, seems to be fit for a measure of the complexity of the string vibration. (8 refs.)

113190 Noncontact measurement of vibrating membrane and plate parameters. R.A. Dudnik, A.E. Ekimov (Appl. Phys. Inst., Acad. of Sci., USSR).

Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.94-7 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.110-13 (Jan. 1983). [received: Sept. 1983]

An algorithm is proposed for determining the parameters of vibrating membranes and plates from the characteristics of the radiation field in the Fraunhofer zone. The algorithm is based on use of the similarity criterion for the problem of oscillating plates and membranes in an elastic medium. The parameters to be determined are: for membranes; the length and stress/density per unit surface ratio; for plates; length, thickness, cylindrical stiffness/density per unit surface ratio, and form of boundary conditions at the plate perimeter. 43.50 NOISE, ITS EFFECTS AND CONTROL

(see also 86.70J Environmental science)

113191 Focus on absorbing materials intended for acoustic screens for transformers. J.-G. Migneron (Univ. Laval, Quebec, Canada).

Can. Acoust./Acoust. Can. (Canada), vol.11, no.4, p.28-36 (Oct. 1983). In French.

The research work presented in this article was originally subsidized by Hydro-Quebec; it constitutes the second part of a project dealing with transformer noise and means of controlling it. The present article is thus a continuation of that published in the preceding issue (see *ibid.*, vol.11, no.3, p.16, 1983) in which a model of the noise impact of transformer stations was described. The materials tested fall into three broad categories: masonry units with resonators, steel resonators with common cavities and tuned membranes. In all three cases these devices were optimized for special use in controlling transformer noise. In addition, the devices were treated to protect them against mechanical failure and climate so as to ensure their effectiveness under real conditions. (8 refs.)

113192 Subjective rating of party walls. J.S. Bradley (Nat. Res. Council Canada, Ottawa, Ontario, Canada).

Can. Acoust./Acoust. Can. (Canada), vol.11, no.4, p.37-45 (Oct. 1983). Results of a field survey of 98 subjects have been analysed and sound isolation measures have been compared to establish the influence of residential noise levels and nonacoustical factors on subjective judgements. A procedure is considered for estimating the properties of an ideal wall. (13 refs.)

113193 Nonstationarity in acoustic fields. Y.H. Tsao, J.K. Hammond (Inst. of Sound & Vibration Res., Univ. of Southampton, Southampton, England).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.827-39 (Sept. 1983). Acoustic pressure fields measured by an observer when the source or observer or both are moving is a nonstationary random process even if the source generates a random process which is stationary in the reference frame of the source. The causes of nonstationarity are classified as being due to wave expansion, directivity, and Doppler shift. This paper is concerned with developing two-dimensional (frequency-time) spectral descriptions for the processes by constraining the processes to fit within the framework of the 'evolutionary spectral density'. Earlier literature has described how evolutionary spectra may be estimated from single sample realizations. Spectral representation forms for free-field acoustic processes produced by moving monopole and dipole excitations are derived from the fundamental wave equations. (29 refs.)

113194 On the application of coherence techniques for source identification in a multiple noise source environment. M.E. Wang, M.J. Crocker (Ray W. Herrick Lab., School of Mech. Engng., Purdue Univ., West Lafayette, IN, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.861-72 (Sept. 1983). Two approaches for noise source identification based on theory for multiple-input systems have been investigated. The concepts of the frequency response function and the coherent residual spectral density function were used to estimate the spectra of the noise sources that were accounted for in the multiple-input model. The key factors which determine the applicability of the techniques for noise source identification are found to be the degrees of coherence between the measured inputs. The experimental results showed that, for a noise system with multiple sources which were slightly coherent to

each other, the techniques presented might be able to estimate the spectra of the noise sources, provided there was only modest measurement contamination. (17 refs.)

113195 Community response to blasting. S.Fidell, R.Horoneff, T.Schultz, S.Teffteller (Bolt Beranek & Newman Inc., Canoga Park, CA, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.888-93 (Sept. 1983). Annoyance due to chronic exposure to blast noise and vibration was assessed in residential areas near two surface mines and a quarry. It was found possible to base useful prediction of the prevalence of high annoyance on a metric of outdoor ground vibration related to high centiles of the long term distribution of exposure levels. (6 refs.)

113196 Single-number quantity for airborne sound insulation. G.Thurzo. *Kep- & Hangtech. (Hungary)*, vol.29, no.4, p.105-8 (Aug. 1983). A characteristic for airborne sound insulation is its frequency dependence. A standardized number of airborne sound insulation is a quantity, characteristic for the one-third octave band which, from the point of view of the number of the one-third octave bands, is to be considered as a data set. As a result of simplification efforts, airborne sound insulation can be described by frequency-independent single-number quantities. Although the single-numbers prevailing in practice for airborne sound insulation have a physical meaning, they cannot form a narrow relationship with the definition, i.e. with the physical content of airborne sound insulation. This paper studies the relationship between current single-number quantities of airborne sound insulation and this latter definition. (no refs.)

113197 Acoustical design and evaluation of silencers. L.J.Eriksson, P.T.Thawani, R.H.Hoops (Nelson Industries Inc., Stoughton, WI, USA). *Sound & Vib. (USA)*, vol.17, no.7, p.20-7 (July 1983). Considerable advances have been made in the last decade in the development of silencer design and evaluation techniques. More accurate computer-based procedures evolved from analytical models have become available. Evaluation techniques utilizing two-channel digital signal analyzers have added a new dimension in the efficient measurement of silencer performance. This article describes various design and evaluation approaches that have significantly improved the capabilities of the modern silencer designer. (42 refs.)

113198 Control of noise and vibration with damping materials. A.D.Nashif (Anatrol Corp., Cincinnati, OH, USA). *Sound & Vib. (USA)*, vol.17, no.7, p.28-36 (July 1983). Damping materials are being used to control noise and vibration in a wide variety of structures. Commercial damping materials that can be used effectively over broader temperature and frequency ranges have become available. Several analytical tools and methods have also been developed to design damping treatments to solve specific noise and/or vibration control problems. The properties of typical commercially-available damping materials are discussed in this article along with application techniques. Criteria for rating the effectiveness of damping treatments are also provided. The article concludes with an example of how damping technology was used to solve a noise and vibration control problem. (7 refs.)

113199 Effect on the measurement of aircraft noise of reflections from the ground. R.C.Payne. *Report Ac 102*, Nat. Phys. Lab., Teddington, England (Dec. 1982), 33 pp. Published data relating to the acoustic impedance of various ground surfaces have been used to estimate the influence of ground reflection on levels of aircraft noise measured at the conventional height of 1.2 m. It is shown that the effect on the perceived noise level can be determined by means of the pressure reflection coefficient at a frequency of 2 kHz, hence removing the requirement for information on acoustic impedance as a function of frequency. A number of techniques for determining the reflection coefficient of ground surfaces at a single frequency have been evaluated and a practical procedure for in-situ measurements has been developed. Using this the reflection coefficients of a variety of ground surfaces have been measured and data are reported. (22 refs.)

113200 Sound reinforcement—equalization in sound reinforcement systems: control room monitors. J.Eargle. *DB Control Eng. Mag. (USA)*, vol.17, no.6, p.18-20 (June 1983). Two methods of equalizing a room are shown. One method uses pink noise generator inserted ahead of the equalizer, and the room response monitored on a real time analyzer. In the other method, one-third octave bands of noise are individually measured and plotted. The individual noise bands enable the user to check the balance between the stereo speakers by noting the position of center phantom images one band at a time. For equalizing a monitor system a high-quality 0.5 inch microphone should be used. (no refs.)

113201 Acoustics+electroacoustics—but how? H.-H.Gruhn. *Funk-Tech. (Germany)*, vol.38, no.7, p.291-2 (July 1983). In German. Based on the theoretical laws of acoustics and electroacoustics the author explains and defines the principles for correct acoustic irradiation of large rooms and in the open air. While stressing the importance of the wavelength and the nature of acoustic absorption, the author explains the possibilities for the adjustment of acoustic power and acoustic scattering by electroacoustic means. Several practical examples, including definition of proper acoustic source arrangements, are presented for better understanding. (no refs.) K.A.K.

113202 Acoustics+electroacoustics—but how? H.-H.Gruhn. *Funk-Tech. (Germany)*, vol.38, no.8, p.335-7 (Aug. 1983). In German. A guide to the placement, powers and directions of loudspeakers, with illustrative examples of a supermarket, church, sports hall and open grounds. (no refs.) F.Q.

113203 Calculation of subjective preference at each seat in a concert hall. Y.Ando (Faculty of Engng., Kobe Univ., Kobe, Japan). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.873-87 (Sept. 1983). This paper represents a method of calculating the subjective preference of sound fields in concert halls before construction. Subjective preference judgements (paired comparison tests) were systematically performed using fully independent objective parameters of acoustic information which describe the signals to the two ears. The sound fields with various combinations of listening level, delay of early multiple reflections, subsequent reverberation time, and magnitude of the interaural cross correlation were simulated with the aid

of a digital computer. The optimal conditions maximizing the subjective preference could be found for each objective parameter, because the parameters had an almost independent effect on the subjective preference judgements. Based on the linear scale value, which is obtained by applying the law of comparative judgement, we can calculate a total preference value according to the 'principle of superposition.' Examples of calculating the preference values by use of the plan and the cross section of a concert hall are described. (18 refs.)

Subjective rating of party walls See Entry 113192

43.60 ACOUSTIC SIGNAL PROCESSING

113204 Acoustic wave diffraction for array processing. R.E.Brooks (TRW Defense & Electronics, Redondo Beach, CA, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2810-16 (15 Sept. 1983).

Many coherent optical processing techniques that are based on wave diffraction can be carried out using acoustic waves. An array of acoustic transducers serves as a coherent radiation source, spatial modulator, and lens. Complex input data are entered by amplitude and phase modulation of the RF transducer drives. The output is retrieved from a second transducer array. This paper discusses the surface acoustic wave (SAW) implementation of space and time Fourier transforms the effect of material anisotropy and the results of an experimental SAW RF spectrum analyzer fabricated on LiNbO₃. (12 refs.)

113205 Equivalent bandwidth of a general class of polynomial smoothers. L.C.Ng, R.A.LaTourette (Naval Underwater Systems Center, New London, CT, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.814-26 (Sept. 1983). This paper presents a detailed investigation of the properties of a general class of least-mean-square-fit (LMSF) smoothers in the presence of a white or colored input sequence. The results of the investigation show that the LMSF can be described as a low-pass filter whose frequency response characteristics can be calculated exactly. A particularly useful result derived from the frequency response characteristics is the LMSF equivalent bandwidth. It was shown that knowledge of LMSF bandwidth, plus knowledge of the input bandwidth, provides the second-order statistical description of the LMSF output noise process. Results of the analysis are verified by extensive computer simulation. (9 refs.)

113206 Side-lobe reduction in the ring array pattern for synthetic aperture imaging of coherent sources. A.K.Luthra (Interspec Inc., Philadelphia, PA, USA), S.A.Kassam.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.840-6 (Sept. 1983). A new technique is described for image formation using a circular array of transducer elements in which each element acts as both a transmitter and receiver. By processing the amplitude and phase measurements acquired in such a system in a particular way, it is shown that it is possible to approach the performance of a transmit-receive filled circular aperture of the same dimension. The technique combines a synthetic aperture scheme with an earlier approach for array pattern synthesis (J^2 synthesis). The proposed technique does not require spatial incoherence of reflections from the object plane, which was a severe limitation in earlier use of J^2 synthesis. The effect of array sampling with a finite number of transducer elements is also examined. (8 refs.)

113207 Some simple expressions for the beamforming properties of focused high-resolution circular arrays, with applications to refocusing systems. J.F.Lynch (Woods Hole Oceanographic Inst., Woods Hole, MA, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.847-50 (Sept. 1983). Some simple analytical expressions for two important optical characteristics of focused high-resolution circular arrays are derived, specifically those for beam patterns and depths of field. The expressions generated, in addition to providing simple estimational tools for array design purposes, also lend themselves to straightforward interpretation in terms of the Fourier (farfield) and Fresnel (nearfield) kernels. Applications to refocusing arrays are discussed, as well as similarities and differences between such (sonar oriented) systems and radar and optical systems. (8 refs.)

113208 Optimum SNR enhancement of narrow-band signals in surface reverberation. F.W.Symons (Appl. Res. Lab., Pennsylvania State Univ., State College, PA, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.851-60 (Sept. 1983). Theoretical performance capabilities of the optimum filter for maximization of signal-to-noise ratio (SNR) and a suboptimum approximation, easy to realize in practice, are compared to the conventional matched filter (designed for white noise only) in the case of low Doppler signals masked by surface reverberation. Spectrum models for surface backscattering as a function of local environmental parameters are based on recent results describing scattering from a subsurface bubble layer. Significant improvements in SNR in the low Doppler region as well as a dramatic dependence of performance on windspeed and direction, and the ratio of reverberation to uncorrelated noise power are predicted. Results serve as average performance limits to be compared to those obtained by algorithmic implementations of optimum and adaptive filters. (19 refs.)

113209 A post-processing on linear predictors equivalent to differencing for pre-emphasis. M.Yanagida, H.Takeyama, O.Kakusho (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).

J. Acoust. Soc. Jpn. (E) (Japan), vol.4, no.3, p.157-9 (July 1983). The effects of differencing on linear predictors have been studied theoretically and were confirmed on natural speech data. After weighing the relative advantages between degradation in S/N ratios, improvement in condition number by differencing, and efficiency of computation, a fast processing scheme for an adaptive flattening filter is developed. (3 refs.)

113210 Recursive techniques for passive source location. J.M.F.Moura (Inst. Superior Tecnico Lisboa, Lisbon, Portugal). *Proceedings of ICASSP 82. IEEE International Conference on Acoustics, Speech and Signal Processing, Paris, France, 3-5 May 1982 (New York, USA: IEEE 1982), p.403-6 vol.1*

The paper is concerned with the location of passive sources. Conceptually, this is viewed as a time delay estimation followed by a geometry determination. Signal, noise, and channel modeling questions affect the first block of the processor, i.e. the delay estimator. The second block is sensitive to the geometry description, namely the hypotheses on the dynamics, the array shape, and the relative observer/source configuration. Commonly used assumptions lead to decoupled effects which simplify the receiver structure. For deterministic array and source dynamics, a finite parameter description results. The receiver is designed via maximum-likelihood techniques. These do not encompass more general situations. To treat the problem of uncertain sensor location, or of stochastic dynamics, a different geometry description is considered. This description represents line arrays and motions as curves in space. Recalling simple facts from differential geometry, one is naturally led

to describe the array geometry and/or the motion dynamics by a set of differential equations. This casts the passive positioning problem in the context of recursive Kalman-Bucy filtering. The problem of sensor uncertainty location and stochastic dynamics can then be dealt with, without having to consider Taylor series type arguments or other unnatural approximations. (5 refs.)

43.63 ACOUSTIC HOLOGRAPHY

113211 Imaging property of acoustical holography for identifying spread sound sources. H.Houjou, K.Umezawa (Res. Lab. of Precision Machinery and Electronics, Tokyo Inst. of Technol., Yokohama, Japan). *Acoust. Lett. (GB)*, vol.6, no.11, p.158-63 (May 1983).

Acoustical holography is one of the most useful methods to reveal sound radiation from a machine of acoustic interest. It is able to show an intensity distribution of the sound sources. In the case when the source is like a point source, the system recognizes the source as it is. However, when the source spreads to some extent in any direction, it is not known how holography displays the source shape. This paper concerns this property of acoustical holography systems, simulating the radiation from line sources. A limited length straight line source placed in a 3-dimensional space and a circular ring source are dealt with. (4 refs.)

43.70 SPEECH COMMUNICATION

(inc. speech perception, speech intelligibility, and speech synthesis; see also 87.36 Speech)

113212 Comparative performance evaluation of different pitch estimation methods for noisy speech. K.K.Pailwal (Div. of Telecommunication, Univ. of Trondheim, Trondheim, Norway).

Acoust. Lett. (GB), vol.6, no.11, p.164-6 (May 1983).

Four different pitch estimation methods are compared as to their performance on noisy voiced speech. These are: 1. the modified autocorrelation method (AUTOC), 2. the cepstral method (CEP), 3. the simplified inverse filtering technique (SIFT), and 4. the average magnitude difference function method (AMDF). Noisy speech is generated by adding white (Gaussian) noise to the natural speech signal. Two types of errors, gross error and fine errors, are measured for each method under different noise conditions. The AMDF method is found to give the best pitch estimation results for noisy speech. (6 refs.)

113213 Residually excited LPC processor for enhancing helium speech intelligibility. G.Duncan (Wolfson Microelectronics Inst., Univ. of Edinburgh, Edinburgh, Scotland), M.A.Jack.

Electron. Lett. (GB), vol.19, no.18, p.710-11 (1 Sept. 1983).

A new approach to restoring the intelligibility of divers' speech uttered in a high-pressure atmosphere containing high percentages of helium gas is presented. The system processing architecture consists of a residually excited linear predictive coder (RELPC) with a novel implementation of time/frequency-domain relationships to simplify processing. (3 refs.)

113214 Characteristics of the glottal turbulent noise source. R.E.Hillman (Dept. of Communication Disorders, Boston Univ., Boston, MA, USA), E.Oesterle, L.L.Feth.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.691-4 (Sept. 1983).

This investigation utilized a reflectionless tube technique to obtain direct estimates of turbulent noise produced at the glottis during whispered vowels. In the past, the glottal turbulent noise source has been described theoretically as a series pressure source having a spectrum that is relatively flat for 2 or 3 oct around a center frequency [K.N. Stevens, *J. Acoust. Soc. Am.* 50, 1180-1192 (1971)]. Center frequency is determined primarily by the area of the constriction at which turbulence is produced with the volume velocity of air flowing through the constriction. The present results were shown to substantiate this theoretically based description of the glottal turbulent noise source. In addition, there was no significant difference between the glottal turbulent noise spectra of male and female speakers. The application of these findings to the synthesis of whispered vowels is discussed. (8 refs.)

113215 Dynamic specification of coarticulated vowels. W.Strange, J.J.Jenkins, T.L.Johnson (Center for Res. in Human Learning, Univ. of Minnesota, Minneapolis, MN, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.695-705 (Sept. 1983).

An adequate theory of vowel perception must account for perceptual constancy over variations in the acoustic structure of coarticulated vowels contributed by speakers, speaking rate, and consonantal context. The authors modified recorded consonant-vowel-consonant syllables electronically to investigate the perceptual efficacy of three types of acoustic information for vowel identification: (1) static spectral 'targets', (2) duration of syllabic nuclei, and (3) formant transitions into and out of the vowel nucleus. Vowels in /b/-vowel-/b/ syllables spoken by one adult male (experiment 1) and by two females and two males (experiment 2) served as the corpus, and seven modified syllable conditions were generated in which different parts of the digitized waveforms of the syllables were deleted and the temporal relationships of the remaining parts were manipulated. Results of identification tests by untrained listeners indicated that dynamic spectral information, contained in initial and final transitions taken together, was sufficient for accurate identification of vowels even when vowel nuclei were attenuated to silence. Furthermore, the dynamic spectral information appeared to be efficacious even when durational parameters specifying intrinsic vowel length were eliminated. (25 refs.)

113216 Effect of burst amplitude on the perception of stop consonant place of articulation. R.N.Ohde (Bill Wilkerson Hearing & Speech Center, Vanderbilt Univ. School of Medicine, Nashville, TN, USA), K.N.Stevens.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.706-14 (Sept. 1983).

The author has examined the effects of the relative amplitude of the release burst on perception of the place of articulation of utterance-initial voiceless and voiced stop consonants. The amplitude of the burst, which occurs within the first 10-15 ms following consonant release, was systematically varied in 5-dB steps from -10 to +10 dB relative to a 'normal' burst amplitude for two labial-to-alveolar synthetic speech continua—one comprising voiceless stops and the other, voiced stops. The distribution of spectral energy in the bursts for the labial and alveolar stops at the ends of the continuum was consistent with the spectrum shapes observed in natural utterances, and intermediate shapes were used for intermediate stimuli on the continuum. The results of identification tests with these stimuli showed that the relative amplitude of the burst significantly affected the perception of the place of articulation of both voiceless and voiced stops, but the effect was greater for the former than the latter. The results are consistent with a view that two basic properties contribute to the labial-alveolar distinction in English. One of these is determined by the time course of the change in amplitude in the high-frequency range (above 2500 Hz) in the few tens of ms following consonantal

release, and the other is determined by the frequencies of spectral peaks associated with the second and third formants in relation to the first formant. (36 refs.)

113217 Perception of intervocalic stop consonants: the contributions of closure duration and formant transitions. V.C.Tartter (Rutgers Univ., Camden, NJ, USA), D.Kat, A.G.Samuel, B.H.Repp.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.715-25 (Sept. 1983).

Acoustic analyses of vowel-consonant-vowel (VCV) utterances indicate that they generally include formant transitions from the first vowel into a period of closure (VC transitions), and transitions out of the closure into the second vowel (CV transitions). Three experiments investigated the perceptual importance of the VC transitions, the CV transitions, and the closure period in identification of medial stop consonants varying in place of articulation. Experiment 1 compared identification of members of synthetic VC and CV continua with those from VCV series made by concatenating corresponding VC and CV stimuli using various closure durations. Experiment 2 examined identification of VCV stimuli constructed with only VC, only CV, or both VC and CV transitions; again closure duration was systematically varied. Experiment 3 correlated CV and VC identification with identification of VCV stimuli. Neither closure duration nor formant transition structure (i.e. only VC, only CV, or both) had an independent effect on identification. Instead, the formant structure and closure duration together strongly affected stop identification. When both VC and CV transitions were present, the CV transitions contributed somewhat more to identification of medial stops with short closures, than the VC transitions did. With longer closure durations, neither set of transitions appeared to determine perceived place of articulation in any simple way. Overall, the data indicate that the perception of a medial consonant is more than simply a (weighted) sum of its parts. (17 refs.)

113218 Intelligibility of VCV segments excised from connected speech.

A.Schmidt-Nielsen (Naval Res. Lab., Washington, DC, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.726-38 (Sept. 1983).

Confusions between pairs of intervocalic consonants excised from connected speech were investigated under several conditions of speech degradation: digital voice processing, noise, and bandpass limiting. The distribution of the types of errors that were made, e.g., voicing, nasality, place of articulation, differed from those made on citation form syllable-initial consonants. Intervocalic consonants that were taken from word-initial position scored higher with no degradations than those taken from word-medial or word-final position, but the medial and final segments suffered less under mild degradations than did the initial ones. (22 refs.)

113219 Effect of a single interfering noise or speech source upon the binaural sentence intelligibility of aged persons. A.J.Duquesnoy (Faculty of Medicine, Free Univ., Amsterdam, Netherlands).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.739-43 (Sept. 1983).

The free-field speech-reception threshold (SRT) for sentences was investigated in quiet and under nine conditions involving noise or competing speech for a group of 20 elderly subjects (ten male, age 75-85; ten female, age 76-88) and a reference group of ten young normal-hearing subjects. The noise source had the same long-term average spectrum as the competing speech. The interfering signals were presented at a constant level of 55 dBA. All elderly subjects had moderate, nearly symmetrical pure-tone hearing losses with an average loss at 500, 1000, and 2000 Hz of between 9 and 40 dB re: ISO-389. The main results are (1) the SRT values in noise and competing speech are about equal, whereas the normal-hearing subjects showed a lower SRT (7 dB lower for the condition that both sound sources are in front) in competing speech than in noise; apparently, the elderly subjects do not benefit from the relatively silent periods in competing speech; (2) the gain obtained by moving the interfering noise source from the front to the lateral position is only 2.5 dB, in contrast to a gain of 9.6 dB for the young subjects; apparently, the elderly are unable to make full use of the spatial divergence between primary speaker and noise source. (16 refs.)

113220 Experimental manipulation of speaking rate for studying temporal variability in children's speech. B.L.Smith, M.D.Sugarman (Speech & Language Pathology, Northwestern Univ., Evanston, IL, USA), S.H.Long.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.744-9 (Sept. 1983).

Children's speech timing is often more variable than adults'. In the present study, two hypotheses that have been proposed to account for this observation are considered. One claims that children do not have neuromotor control capabilities comparable to adults. The other suggests that the greater variability is a statistical consequence of children's longer segment durations. These two hypotheses were examined by having children and adults speak at both faster and slower rates than normal. Within-group comparisons across different rates and between-group comparisons for similar durational values were made from spectrographic measurements. Results indicate that both statistical and neuromotor factors seem to contribute to the greater variability commonly observed in children's speech. (29 refs.)

113221 Speaker recognition by statistical features and dynamic features.

S.Furui (Res. Div., NTT, Tokyo, Japan).

Rev. Electr. Commun. Lab. (Japan), vol.30, no.3, p.467-82 (May 1982).

[received: Aug. 1983]

Performance of four text-dependent speaker recognition methods using statistical or dynamic features of speech spectrum extracted from spoken words or a short sentence were compared with each other. It has been clarified that almost the same recognition accuracies can be obtained by either statistical or dynamic features, and that the statistical features have advantages of a small amount of calculation and memory size for feature extraction and recognition. The combination effect of these two kinds of features and effectiveness of a spectral equalization technique have been ascertained. Very high speaker recognition performance can be obtained by a new method using statistical features. (25 refs.)

113222 Acoustic characteristics of professional male announcers' speech.

H.Kuwabara, K.Ohgushi (NHK Broadcasting Sci. Res. Labs., Tokyo, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan), vol.J66A, no.6, p.545-52 (June 1983). In Japanese.

Acoustic analyses were performed to investigate voice-qualities and acoustic characteristics of professional male announcers' speech by making a contrast with laymen's speech. Ten professional announcers and five laymen pronounced a short Japanese sentence [a o i so ra] which was used as the speech material. Four acoustic features, pitch pattern and mean pitch frequency as the vocal cord parameters and formant pattern and average spectral envelope as the vocal tract parameters, were extracted. Dynamic aspect of such acoustic features as pitch and formant patterns was found to be specific to the announcer's voice and the formant pattern, in particular, was the one which contributed the most to the announcer's voice-quality. Characteristics of the announcer's voice were also found in the average spectral envelope in that their voices showed a relatively high spectral level in the range from 3 to 4 kHz. This seems to be a primary acoustic correlate which makes the announcer's voice rather 'brilliant'. (17 refs.)

113223 Optical probe for narrow sound field. R.Ohba (Dept. of Appl. Phys., Hokkaido Univ., Sapporo, Japan).
Technological and Methodological Advances in Measurement, Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.453-62 vol.2
An optical probe microphone is proposed which detects the movement of a sound receiving micro diaphragm located at a distant point using a graded-index optical fiber. The sensitivity, frequency response and relations between the SNR performance and structure of the microphone system are investigated theoretically. It is confirmed that experimentally constructed microphones are as sensitive as the standard half inch condenser microphone and that the results of the theoretical investigation are valid. Applications of the microphone to a probe for narrow sound fields in an acoustic tube and in local tracts are described. (5 refs.)

113224 An introduction to speech recognition. T.A.Williams (Motorola Inc., Austin, TX, USA).
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.11-1/1-3
A brief description of the two major classifications of speech recognition systems is given, followed by considerations involved in the real world application of these systems. (3 refs.)

113225 A high-quality real-time text-to-speech converter. D.L.Gilblom (Telesensory Speech Systems, Palo Alto, CA, USA).
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.11-2/1-6
Recent advances in digital signal processing devices have made it possible to produce a compact unit capable of converting unrestricted English text (in serial ASCII form) into readily intelligible spoken English. The PROSE 2000(tm) text-to-speech converter described in the paper was developed by Telesensory Speech Systems to perform this function. In addition to producing clear spoken English, the PROSE 2000 board can accept a variety of user commands which control aspects of text interpretation and speech style. Independent tests demonstrate that listeners will understand paragraph-length passages spoken by the PROSE 2000 board about as well as they would understand human speech. (3 refs.)

113226 DIGITALKER™ vocabulary selection system. J.Costello (Nat. Semiconductor Corp., Santa Clara, CA, USA), G.B.Smith.
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.11-3/1-6
For the past two years, National Semiconductor has been selling the low cost, high quality DIGITALKER speech synthesis system. The DIGITALKER speech synthesis system is actually a speech processor which produces a speech output when coupled with input from a standard semiconductor memory that contains speech data pre-encoded in a highly compressed format. Since the original introduction of the DIGITALKER speech synthesis system, NSC has provided users with two kinds of synthetic speech data: standard vocabulary ROMs and custom vocabularies encoded to customer specification. In looking for a more flexible way to provide users with standard vocabularies for the DIGITALKER SPC, NSC developed the DVSS which is a tool for creating user-selected vocabularies from a large data base of standard words. (no refs.)

113227 Low cost voice recognition systems. S.S.Viglione (Interstate Electronics Corp., Anaheim, CA, USA).
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.11-4/1-10
A low cost, high performance discrete word, speaker dependent word recognition module, capable of recognizing 100 word vocabularies is discussed. A switched capacitor filter chip, implementing the front end processor of the word recognition system, is presented. The filter chip, with a companion microprocessor with on board ROM, forms the basis for a speech recognition chip set. This chip set reduces the original board component count by 60-70% permitting dramatic economies in the use of speech recognition systems. (no refs.)

43.75 MUSIC AND MUSICAL INSTRUMENTS

113228 Considerations on physical characteristics of samisen tones. S.Ando, K.Yamaguchi (Nippon Gakki Co. Ltd., Hamamatsu, Japan).
J. Acoust. Soc. Jpn. (Japan), vol.39, no.7, p.433-43 (July 1983). In Japanese.
'Nagauta' samisen tones are analyzed and several physical values are extracted using digital signal processing techniques. The synthesized tones based on these data are produced and studied with regard to the features of physical parameters contributing to the tone quality of samisens. Physical parameters of samisen tones are classified according to the following, (1) attack noise, (2) spectrum, (3) overall amplitude envelope, (4) amplitude envelopes of each harmonic, and (5) time variance of pitch after attack transient, and they are analyzed for several notes and for several playing styles. The results show that in the spectrum, amplitude levels of lower harmonics are very small, and in the amplitude envelope, they have very rapid raises and rather rapid exponential decays compared with other musical instrument tones. Using these data, the synthesized tones are made by means of additive synthesis and compared to the original tones of samisens. As a result, it is verified that the synthesized tones with the amplitude of each harmonic being time-variant have a rather good similarity to original samisen tones, and that the synthesized tones with attack noise in the attack transient part are distinguishably improved. (24 refs.)

43.85 ACOUSTICAL MEASUREMENTS AND INSTRUMENTATION

(for acoustic noise measurement, see also 43.50; for photoacoustic spectroscopy, see 07.65)

113229 Numerical ultrasonic interferometry for the determination of the stiffness matrix of compound materials. B.Hosten, A.Barrot, J.Roux (Univ. de Bordeaux I, Talence, France).
Acustica (Germany), vol.53, no.4, p.211-17 (Aug. 1983). In French.
Ultrasonic interferometry based on a numerical method for the measurement of elastic constants in anisotropic materials (wood, CFR, fiber glass, etc...) has lead to an apparatus, which is described. The device and the metrology procedure have also been developed in order to achieve complete automatization. The large amount of experimental data allows one to use an optimization method for more reliable results. (6 refs.)

113230 On the float method of measuring ultrasonic output. V.N.Bindal, A.Kumar, R.C.Chivers (Nat. Phys. Lab., New Delhi, India).
Acustica (Germany), vol.53, no.4, p.219-23 (Aug. 1983).
Two new systems have been reported which were developed in order to try and improve the float method of ultrasonic power measurement, to achieve better sensitivity and higher accuracy. In both these methods the distance between the float and the transducer remains fixed, and thus the methods have the advantage over the null method. The lift method maintains the distance between float and transducer (within the nearfield region) but does not improve the sensitivity or accuracy. The side tube method improves both the sensitivity and accuracy and, at the same time, keeps the float at a fixed distance from the transducer. The sensitivity of a float system can be increased by suitably changing the liquids. Use of a mixture of benzene and carbon tetrachloride (50:50) in place of pure carbon tetrachloride has been shown to increase the sensitivity of the float system by a factor of 2.56. This makes the system more useful for the measurement of low powers, including the average power of pulsed systems. (12 refs.)

113231 The effect of the modulation transfer function on the image in an acoustic microscope. J.Litniewski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Acoust. (Poland), vol.8, no.1, p.31-40 (1983).
Considers the effect of the diffraction phenomenon and of errors in the geometry of the system on the quality of images obtained using a scanning acoustic microscope working in a transmission. An analysis of image formation is presented, permitting the derivation of the formula for the modulation transfer function (MTF). The effect of nonaxial and out-of-parallel elements of the system on the symmetry of this function with respect to zero frequency is determined. The paper also shows microscopic images obtained from numerical simulation for two selected objects with different magnitude of deviation from the symmetry of the function MTF. The shape of the function MTF for a system working at a relatively low frequency of 3 MHz was also determined experimentally and compared with the shape expected according to the theoretical formula derived in this paper. Satisfactory agreement was observed. (5 refs.)

113232 Dynamic focusing of an ultrasonic beam by means of a phased annular array using a pulse technique. T.Kujawska (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Acoust. (Poland), vol.8, no.1, p.69-82 (1983).
An approach to compute the transient radiation resulting from an impulse velocity motion of an array of annular pistons in a rigid planar infinite baffle is presented. The approach is based on developing the expression for an impulse response function, which is the time-dependent velocity potential at a spatial point resulting from an impulse velocity of a piston. The time-dependent pressure for any piston velocity motion may then be computed by a convolution of the piston velocity with the appropriate impulse response. Numerical results of near field time-dependent radiation from annular phased array are discussed for pulsed velocity conditions. The lateral acoustical pressure distribution at different field depths is shown. The ultrasonic beamwidth as a function of the depth for every focal zone is also presented. Obtained results were compared with corresponding dependences for steady states. (14 refs.)

113233 Scanning acoustic microscopy: review of recent developments. H.K.Wickramasinghe (Univ. Coll., Univ. of London, London, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.52 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).
Summary form only given. Scanning acoustic microscopy has advanced to the point where the resolution in water is comparable to that of a high quality optical microscope. The resolving power of the acoustic microscope can be further improved by resorting to a fluid which has a lower sound velocity than water. The two practical possibilities are cryogenic liquids, and higher pressure gases. Progress on both these fronts is discussed. Improving the resolving power is only one aspect of the author's research effort; it is equally important to obtain quantitative information from the recorded images. Several schemes are being investigated whereby it is possible to record the spatial frequency transmittance or reflectance of the object and hence deduce the sound velocity and density on a microscopic scale. In order to make accurate predictions on the elastic parameters in certain experiments it is necessary to measure the phase of the acoustic beam with great accuracy. For this purpose, a differential interference contrast acoustic microscope has been developed. Finally, two new forms of microscopy are described—photodisplacement and photothermal microscopy—which are based on the microscopic measurement of some thermometric property. (no refs.)

113234 Applications of acoustic microscopy in the semiconductor industry. A.J.Miller (GEC plc, Hirst Res. Centre, Wembley, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.53-7 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).
The Quate scanning acoustic microscope has now become established in university research groups, and interest is being shown from industry. The author has constructed a 1 GHz reflection instrument with lateral resolution better than 2 μ m, and has been evaluating a number of possible applications. Some of these are discussed in detail and include: (i) The examination of integrated circuit chips processed in MOS technologies, using the subsurface capability of the instrument. (ii) Metallurgical studies. (iii) Thin-film studies, including organic thin films. Emphasis is placed on the merits of acoustic microscopy as opposed to other methods, and further developments of the technique likely to be of use are discussed. (9 refs.)

113235 Scanning electron acoustic microscopy. G.Davies, A.Howie, L.Staveley-Smith (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.58-65 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).
The principles and basic imaging theory of electron acoustic microscopy are outlined and illustrated with images of semiconductor devices. Image contrast arises from local variations in stopping power and thermal properties of the specimen, but variations in elastic properties are also important. In elastically anisotropic materials the contrast depends on crystallographic grain orientation. Examples of such grain contrast are discussed as well as of grain boundary contrast which is interesting but less well understood. (16 refs.)

113236 Helium acoustic microscopy. A.F.G.Wyatt (Dept. of Phys., Univ. of Exeter, Exeter, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.66-73 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982). Acoustic microscopy using liquid ^4He offers the possibility of considerably higher resolution than microscopes at room temperature which use water as the coupling medium. At the same frequency the wavelength of sound in liquid helium is a sixth of that in water and because there is no attenuation in liquid ^4He there is the possibility of using much higher frequencies than is presently used (3 GHz) with water. The properties of liquid ^4He relevant to this application are reviewed together with the equipment necessary to work to 0.1K. The information likely to be obtained from helium microscopy is considered and compared to room temperature acoustic microscopy. Although helium acoustic microscopy is still in its infancy recent results indicate that it is likely to be a valuable new tool. (12 refs.)

113237 Acoustic microscopy in materials science. G.A.D.Briggs, M.G.Somekh, C.Ilett (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.74-80 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982). Images are presented which illustrate applications of the scanning acoustic microscope to problems in studies of materials. In transmission the structure of a diffusion bond is revealed; in reflection images of grains, cracks and oxides are shown. A theoretical outline is given indicating how the microscope may be used as a quantitative elastic microprobe. (14 refs.)

113238 Temporal peak intensity. E.L.Carstensen, K.J.Parker, D.B.Barbee (Dept. of Electrical Engng., Univ. of Rochester, Rochester, NY, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.1057-8 (Sept. 1983). Two methods for measurement of the maximum intensity I_m as defined by the National Council for Radiation Protection are compared. One uses a calibrated broadband hydrophone; the other uses a spherical radiometer. A suggestion is made for measurement of a spatial average, temporal maximum intensity to be used in the nearfield of a transducer. (5 refs.)

113239 Determination and statistical evaluation of the sound power level of machines and their qualification according to the noise emission. F.Augusztnovicz, L.Czabaly. *KeP- & Hangtech. (Hungary)*, vol.29, no.4, p.97-104 (Aug. 1983). The sound power level is the most suitable quantity for the characterization of the noise production of machines because it is determined by the noise emission of the machine only. There is an international standard for determining the sound level which is spreading more and more in Hungary. The paper gives a brief survey of the system of standards and discusses the method of statistical evaluation of sound power levels determined by statistical methods. It gives a summary of the theoretical basis of the statistical evaluation and presents the results of a measurement series accomplished on a machine-type as well as the conclusions drawn from them. (11 refs.)

113240 Measuring the energy characteristics of a sound field in an interferometer. A.N.Ivannikov, F.V.Rozhin, O.S.Tonakanov (Dept. of Acoustics, Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.54-9 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.47-52 (1983). The basic relations characterizing the parameters of a sound field in an interferometer are considered. An experimental apparatus and procedure is described, allowing the characteristics of the reflective surface to be described on the basis of measurements of the power flux density. (2 refs.)

113241 An identification system for traveling sound sources. F.Suzuki, F.Sasaki, S.Furukawa (Acoustics & Audio Engng. Res. Div., NHK, Tokyo, Japan). *NHK Lab. Note (Japan)*, no.286, p.1-11 (March 1983). [received: Aug. 1983] For the measurement of sound from a traveling source, such as aircraft noise, it is necessary to collect the source noise alone. Identification and the automatic measurement of noise from such sources are needed to save work and to offer the advantages of continuous measurement under bad conditions, or for long periods. The authors propose a method for the identification of noise sources by using spatial information from a traveling noise source. This they do by finding a cross-correlation function for the outputs of two microphones located separately, and by identifying the pattern of this function. Furthermore, they propose a good circuit-design for a correlator, and have succeeded in building a simple identifier, using a microcomputer, for the pattern-identification process. Theoretical identification using this method produced good results in field tests. (1 ref.)

113242 Measurement of the velocity of acoustic surface waves using the pulse superposition method. A.L.Bolotyuk, S.N.Naumov, V.K.Razgonyayev, I.B.Yakovkin. *Radio Eng. & Electron. Phys. (USA)*, vol.27, no.12, p.163-7 (Dec. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.12, p.2464 et seq. (Dec. 1982). [received: Sept. 1983] A lowpass filter is used to enhance the accuracy of measuring the velocity of acoustic waves using the pulse superposition method. The obtained experimental data are presented and the measurement method is described in detail. (8 refs.)

113243 Smooth separate adjustment of the group delay and phase of the carrier frequency of a signal in an acoustic delay line. A.F.Bessonov, L.N.Deryugin, V.A.Komotskiy, M.V.Kotyukov. *Telecommun. & Radio Eng. Part 2 (USA)*, vol.37, no.9, p.96-8 (Sept. 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.9, p.58-60 (Sept. 1982). A delay line using surface acoustic waves with optical readout of the signal in the presence of a stationary reference grating whose lines are inclined to the waveguide is discussed. (5 refs.)

113244 New electrostatic method for absolute pressure calibration of pressure sensors. Z.Skvor (Electrotech. Faculty, Tech. Univ., Prague, Czechoslovakia). *Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.533-40 vol.2* Describes an electrostatic method for pressure calibration of acoustic sensors, especially the condenser microphones, at middle and low sonic and infrasonic frequencies. The fundamental arrangement forms an electrostatic transducer with a thin air gap acting as a calibration cavity. Another arrangement is an electrostatic transducer whose diaphragm is loaded on both sides by cavities of adjustable volume. This method is based on the measurement of electrical quantities, i.e., the capacitance and voltage, and geometrical dimensions and eliminates application of correction at infrasonic frequencies. (3 refs.)

43.88 TRANSDUCTION; DEVICES FOR THE GENERATION AND REPRODUCTION OF SOUND

- 113245 The creation of a new studio microphone.** J.C.Hansen (Bruel & Kjaer, Naerum, Denmark), P.S.White. *DB Sound Eng. Mag. (USA)*, vol.17, no.6, p.27-31 (June 1983). The design goals to be met by an acoustically transparent microphone are summarized. To meet these requirements Bruel & Kjaer developed two basic condenser microphone constructions utilizing the pre-polarized technique. In addition to swept-sine methods of measurement, time delay spectrometry was used for evaluating the microphones at various stages of development. Amplitude and phase responses of the microphones are also given. (6 refs.)
- 113246 You can't just listen to a microphone.** G.M.Hockman. *DB Sound Eng. Mag. (USA)*, vol.17, no.6, p.32-4 (June 1983). The use of a FFT system to evaluate microphone responses is discussed. FFT-based tests are proving valuable in designing vocal microphones. In using FFT to address the problems of handling noise, the analyzer displays specific amplitude and spectral content of the handling noise. The result of an FFT analysis of typical handling noise response compared to a shock-mount system employing acoustic feedback is given. Also the result of the hand-held response of a vocal microphone with and without an external windscreen is included. (no refs.)
- 113247 Improved feed network for group-type unidirectional transducers.** G.Macchiarella, G.Viola (Politecnico di Milano, Milano, Italy). *Electron. Lett. (GB)*, vol.19, no.17, p.680-1 (18 Aug. 1983). Proposes a phasing and matching network for group-type unidirectional transducers (GT-UDTs) which takes into account the electroacoustic interactions between the two phases of the GT-UDT. In comparison with analogous feed circuits from the literature, this network represents an improvement as far as the reduction of the residual fluctuations in the passband frequency response of a GT-UDT device is concerned. (6 refs.)
- 113248 Experimental method for determination of the vibrations distribution of the diaphragms of electroacoustic transducers.** E.Hojan, M.Niewiarowicz, J.Florkowski (Inst. fur Akustik, Adam Mickiewicz Univ., Poznan, Poland). *Frequenz (Germany)*, vol.37, no.1, p.12-15 (Jan. 1983). In German. [received: Aug. 1983] The elaborated contactless measuring method of the diaphragm vibrations of electroacoustic transducers by applying an optical 'transmission' permits the recording of vibrations of diaphragms in the whole range of acoustic frequencies. This method may also be utilized for investigating diaphragms made of semi-transparent materials. (6 refs.)
- 113249 A Lamb wave voltage sensor.** K.Toda, K.Mizutani (Dept. of Electrical Engng., Nat. Defense Acad., Yokosuka, Japan). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.677-9 (Sept. 1983). A voltage sensor using a Lamb wave delay line oscillator is described. The device consists of two pairs of interdigital transducers and one plate electrode at the central part of the device. All of these transducers have the counter electrodes on the bottom surface of the substrate. The oscillation frequency of the device changes significantly with the voltage applied to the central plate electrode. Performances of the voltage sensor are given, including sensitivity and its frequency dependence. (3 refs.)
- 113250 Analysis and reduction techniques of the driving force distortion of loudspeakers.** T.Ueno, K.I.Takahashi, S.I.Ishii, T.Fukuyama (Matsushita Electric Industrial Co. Ltd., Moriguchi, Japan). *J. Acoust. Soc. Jpn. (Japan)*, vol.39, no.7, p.444-51 (July 1983). In Japanese. The conventional distortion reduction methods such as copper cap, laminate, core can not satisfy the recently developed low distortion reproduction systems like PCM. Corresponding to this situation, the author tried to analyse the force distortion of a loudspeaker and develop new low distortion techniques. The driving force of a loudspeaker is expressed as Bli , whereby B is called the force factor and i is the voice coil current. To reduce the driving force distortion, the force factor must be constant and the voice coil current has to

be linear. From their analysis, the condition for the constant force factor is that the magnetic flux variation across the voice coil must be zero. For this purpose, two techniques are proposed by the authors: one is the magnetic flux feedback (MFFB) and another is the pushpull construction. MFFB is a feedback system which cancels the flux variation across the voice coil. 2nd HD is reduced to 0.03% at 90 dB/m. The pushpull construction has a symmetrical magnetic circuit with a voice coil pair, so the 2nd HD is reduced. To reduce the voice coil current distortion, the constant current drive amplifier is used. By this amplifier, 3rd HD is reduced to 0.01% at 1 W. (8 refs.)

113251 Study of elementary photophysical and photochemical processes in organic molecules using the optoacoustical effect. A.M.Bonch-Bruevich, T.K.Razumova, I.O.Starobogatov. *J. Appl. Spectrosc. (USA)*, vol.37, no.6, p.1413-27 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.981-96 (Dec. 1982). [received: Sept. 1983]

Photophysical and photochemical processes in organic molecules have been studied intensively for many years. New possibilities for studying them are opened up by optoacoustical (OA) methods which permit recording nonradiative transitions in molecules. Such transitions lead to liberation of part of the absorbed energy in the form of heat and then to excitation of the acoustical signal. Under certain conditions when a liquid is excited by a nanosecond pulse of radiation, the amplitude of a signal on a piezosensor, recording the acoustic wave, is proportional to the absorbed energy liberated as heat and does not depend on the cross section of the beam of exciting radiation. With single-photon absorption, the signal amplitude is likewise independent of the intensity distribution of the exciting radiation over the beam cross section. This permits using the pulsed OA effect for measuring the fraction of absorbed energy of the exciting optical pulse liberated as heat and thus obtaining data necessary to determine the relative probability of a nonradiative transition out of the excited states of the molecules being studied. Application of the OA technique in itself, as well as together with luminescence measurements, greatly enlarges the possibilities for obtaining information on elementary processes occurring in molecules with optical excitation, simplifies the procedure for a number of measurements, and also permits observing processes that are inaccessible to other techniques. These possibilities are illustrated for photophysical and photochemical processes in solutions of complex molecules. (36 refs.)

113252 A flat piezoelectric polymer film loudspeaker as a multi-resonance system. J.Ohga (Musashino Electrical Communication Lab., NTT, Tokyo, Japan).

J. Acoust. Soc. Jpn. (E) (Japan), vol.4, no.3, p.113-20 (July 1983). A flat diaphragm full-range loudspeaker utilizing a piezoelectric polymer is described. This loudspeaker is characterized by an excellently simple constitution and multiresonance response characteristics. Since the fundamental resonant frequency of a loudspeaker should be as low as possible, it is convenient to utilize the flexural vibration of a bimorph diaphragm. The input-output relation of a bimorph diaphragm radiator in a multi-resonance frequency region is studied theoretically, and the formula for estimating output and sound pressure level for the resonant peak is given. This is also examined experimentally. (15 refs.)

113253 Influence of losses on the characteristics of a distributed-feedback surface-acoustic wave resonator. V.M.Pashkin, M.S.Sandler, B.V.Sveshnikov. *Radiophys. & Quantum Electron. (USA)*, vol.26, no.1, p.89-94 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.103-9 (Jan. 1983). [received: Sept. 1983]

The characteristics of a distributed-feedback resonator in the form of a long interdigital SAW transducer are investigated. The dependence of the resonator Q on the typical scales of the system—the diffraction length and the attenuation length—is analyzed. (11 refs.)

44.00 HEAT FLOW, THERMAL AND THERMODYNAMIC PROCESSES

44.10 HEAT CONDUCTION (MODELS, PHENOMENOLOGICAL DESCRIPTION)

113254 'Transient heat conduction in composite plates, cylinders or spheres'. P.C.Wankhede (Dept. of Education, Nagpur Univ., Nagpur, India), B.R.Bhonsle.

Proc. Natl. Acad. Sci. India Sect. A, vol.52, pt.2, p.245-56 (1982). [received: Aug. 1983]

The solution of the problem of transient heat conduction in composite plates, cylinders or spheres, consisting of k-layers of different materials with different thermal properties is studied. These are subjected to the generation of heat in the body as well as at the interfaces with imperfect thermal contact under arbitrary initial temperature distribution. The authors employ the integral transformation technique, in the form of an infinite series for which two alternative suitable forms for detailed numerical commutation under different boundary and interfacial conditions are given by introducing the so-called pseudosteady temperature distribution function. 113255 A note on the heat balance integral method applied to the resolution of a one-phase Stefan problem with an increasing prescribed flux on the fixed face. G.G.Garguichevich (Univ. of Nacional de Rosario, Rosario, Argentina).

Int. Commun. Heat & Mass Transfer (GB), vol.10, no.4, p.349-55 (July-Aug. 1983).

The author applies the heat balance integral method to solve the problem of melting in a semiinfinite slab with a prescribed flux on the fixed face. The author obtains a satisfactory approximate solution considering the results of Tarzia (1982), in opposition to the fact stated by Goodman (1958) for generally increasing fluxes on the fixed face. (3 refs.)

113256 Optimization of work regimes and geometrical parameters of spirally corrugated tubes in heat exchanges. Yu.S.Voskresenskii, P.A.Savel'ev. *Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.86-93 (1983). In Russian.

The paper presents a generalization of experimental data of various authors on convective heat transfers in spirally corrugated tubes (SCT). For the cases considered the optimum SCT geometry in the Reynolds range 1×10⁴ to 5×10⁴ are derived. (13 refs.)

113257 Heat transfer to refrigerant in horizontal tubes of evaporator. S.Yoshida, K.Nishikawa, T.Matsunaga, H.Nakata. *Refrigeration (Japan)*, vol.58, no.666, p.331-8 (April 1983). In Japanese.

Experimental investigations were made of heat transfer to Refrigerant-22 inside horizontal, smooth evaporator-tubes. Data of the local heat transfer coefficients as well as circumferentially averaged heat transfer coefficients were obtained for pressures of 0.29 to 0.59 MPa, mass velocities of 100 to 500 kg/m²s, heat fluxes of 5 to 35 kW/m², and inside diameters of 7.0 and 10.2 mm. The flow patterns were observed through a sight glass at the tube exit. The effects of the various parameters on the heat transfer were clarified, and a dimensionless correlation of the heat transfer coefficients was obtained, which agreed with the present experimental data within the limit of ±30 percent. (18 refs.)

113258 Study of the operation of heat pipes with gas-liquid solutions. R.Muller (Tech. Univ. Dresden, Dresden, Germany). *Wiss. Z. Tech. Univ. Dresden (Germany)*, vol.32, no.2, p.175-9 (1983). In German.

Analyses heat pipes with two-component filling, such as water and ammonia. The heat pipes operate in three regimes: single component, transition and two-component zones. Equations for the static performance are presented, and theoretical and experimental results of dynamic studies are plotted for various solubilities. (6 refs.) G.M.E.

44.40 RADIATIVE HEAT TRANSFER

113259 P-N approximation for radiative heat transfer in a nongray medium. A.Yucel, Y.Bayazitoglu (Rice Univ., Houston, TX, USA). *AIAA J. (USA)*, vol.21, no.8, p.1196-203 (Aug. 1983).

Using the rectangular model to characterize the spectral dependence of the absorption coefficient, the P-N approximation is extended to treat nongray radiative transfer problems in planar media. Specifically, the P-1 and P-3 approximation formulations are developed for a medium with any number of bands. Analytical solutions are derived for the special case of a single-level absorption coefficient. Numerical solutions are obtained for a medium with a two-level absorption coefficient. Comparisons with the available exact solutions for radiative equilibrium show that the P-1 and P-3 approximations generate accurate results. Solutions for internal heat generation are also discussed. (29 refs.)

113260 Effectiveness of the model of volume backscattering in the theory of radiation transfer in media with axisymmetric scattering indices. G.Ya.Belov.

High Temp. (USA), vol.20, no.6, p.871-8 (Nov.-Dec. 1982). Translation of: *Teplotiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1102-9 (Nov.-Dec. 1982). [received: Sept. 1983]

The effectiveness of the backscattering model is verified by analytical (backscattering) and numerical (the real index) solution of the problem of diffuse-radiation transfer in a layer of a medium with nonreflecting boundaries in the case of an isotropic-isotropic 'forward-backward' scattering index, and by comparison with known accurate solutions for media with isotropic and linearly anisotropic scattering. A simple arithmetical relation is established between the parameter taking the form of the axisymmetric index into account and the quantity characterizing the fraction of the radiation scattered in backward directions. Calculations of the characteristics of the radiation field in a light-scattering layer lead to close results over a broad range of variation of the independent parameters. (32 refs.)

113261 Theoretical model on the temperature profile within the cylindrical conductor heated by induction current. Dae Soo Kim. *J. Korean Inst. Met.*, vol.21, no.2, p.117-32 (Feb. 1983). In Korean. [received: Sept. 1983]

A theoretical model was proposed to predict the temperature profile within the solid cylindrical conductor subject to induction heating. The model takes into account of heat conduction inside the conductor with the volumetric heat source supplied by induced current, incorporated with heat transfer between the cylindrical conductor and surrounding fluid. It is found that the geometrical shape and the frequency can affect the temperature distribution within the conductor. (25 refs.)

44.60 THERMODYNAMIC PROCESSES (PHENOMENOLOGY, EXPERIMENTAL TECHNIQUES)

(see also 05.70 Thermodynamics, 07.20 Thermal instruments and techniques)

113262 The second law as a selection principle: the microscopic theory of dissipative processes in quantum systems. I.Prigogine, C.George (Faculte des Sci., Univ. Libre de Bruxelles, Brussels, Belgium). *Proc. Natl. Acad. Sci. USA*, vol.80, no.14, p.4590-4 (July 1983).

The second law of thermodynamics, for quantum systems, is formulated, on the microscopic level. As for classical systems, such a formulation is only possible when specific conditions are satisfied (continuous spectrum, nonvanishing of the collision operator, etc.). The unitary dynamical group can then be mapped into two contractive semigroups, reaching equilibrium either for $t \rightarrow +\infty$ or for $t \rightarrow -\infty$. The second law appears as a symmetry-breaking selection principle, limiting the observables and density functions to the class that tends to thermodynamic equilibrium in the future (for $t \rightarrow +\infty$). The physical content of the dynamical structure is now displayed in terms of the appropriate semigroup, which is realized through a nonunitary transformation. The superposition principle of quantum mechanics has to be considered as irreversible processes transform pure states into mixtures and unitary transformations are limited by the requirement that entropy remains invariant. In the semigroup representation, interacting fields lead to units that behave incoherently at equilibrium. Inversely, nonequilibrium constraints introduce correlations between these units. 44.90 OTHER TOPICS IN HEAT FLOW, THERMAL AND THERMODYNAMIC PROCESSES

113263 Experimental study of heat-transfer burnout in horizontal steam-generating channels with a porous inner lining and circumferentially nonuniform heating. A.I.Leont'ev, I.L.Mostinskii, V.S.Polonskii, M.A.Strykovich, I.M.Chernika (Inst. of High Temperatures, Acad. of Sci., USSR). *High Temp. (USA)*, vol.20, no.6, p.897-901 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1131-5 (Nov.-Dec. 1982). [received: Sept. 1983]

Heat-tran horizontal steam-generating channels with a capillary-porous inner lining in the form of filter gauze for various circumferential-heating laws. The experiments are performed on stainless steel tubes. The heat transfer medium is chemically desalinated water. A comparison of the data under conditions of identical circumferential heat-release laws shows that for large flow velocities, the porous structure raises the critical steam content considerably and broadens the burnout-safe operating range of steam-generating channels. Nonuniform heating helps to raise the local burnout heat fluxes. On the other hand, at lower mass-flow rate the critical steam content and pressure are observed to have a complicated influence on q_{cr} . (12 refs.)

46.00 MECHANICS, ELASTICITY, RHEOLOGY

113264 Analogies of 6 classic properties of materials. B.Melz. *Bull. Assoc. Suisse Electr. (Switzerland)*, vol.74, no.15, p.861-3 (6 Aug. 1983). In German.

Discusses relations between mechanical elasticity, hydromechanical permeability, thermal conductivity, magnetic permeability, dielectric displacement and electric conductivity. They can all be represented by identical mathematical equations of the general type $E = (x/A) dF/dx$, where dF/dx is the spring constant, hydromechanical conductivity, thermal conductivity, magnetic inductivity, capacitance, or electric conductivity, A a cross-section, F a force, flux or current, E a modulus, x a length. (5 refs.) J.S.

46.10 MECHANICS OF DISCRETE SYSTEMS

(see also 03.20 General mathematical aspects)

113265 Stability of steady motions of a rigid body with an elastic shell partially filled with fluid. V.N.Rubanovskii.

Appl. Math. & Mech. (USA), vol.46, no.4, p.430-7 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.543-52 (1982). [received: Sept. 1983]

A problem of stability of steady motions of a rigid body with a cavity in the form of a closed thin elastic shell partially filled with fluid, in a conservative force field, is considered. It is assumed that stationary holonomic constraints are imposed on the body allowing its rotation about some spatially fixed axis, and the forces acting on the body have zero moment about this axis. The

conditions of stability are obtained from the solution of the problem dealing with the minimum of the changed potential energy W of the system obtained by studying its second variation. Sufficient conditions of the positive definiteness of $\delta^2 W$ are obtained in the form of the Silvester condition of positive definiteness of some quadratic form of a finite number of variables. A method for constructing this quadratic form is given. (7 refs.)

113266 On the motion of a heavy homogeneous ellipsoid on a fixed horizontal plane. A.P.Markeev. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.438-49 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.553-67 (1982). [received: Sept. 1983]

Periodic motions without sliding of a heavy homogeneous ellipsoid of nearly spherical shape on a horizontal plane is investigated. The existence of periodic motions of the ellipsoid relative to its center of mass is established on the basis of known solutions to the problem of the homogeneous sphere steady motions on a plane. Periodic motions are determined, their stability is investigated, the reaction of the plane is calculated and traces of the ellipsoid-plane contact point on the plane and ellipsoid surface and the ellipsoid orientation in absolute space are determined. The motion of such an ellipsoid on an absolutely smooth plane is analyzed, and is shown to be perpetual (for all times) and close to regular precession about the moment of the momentum vector of constant length and precessing at constant angular velocity about the vertical to which it is inclined at a constant angle. (21 refs.)

113267 On the regular precession of a body of revolution on a horizontal plane with friction. A.V.Karapetian. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.450-3 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.568-72 (1982). [received: Sept. 1983]

Conditions of existence and stability of regular precession of a heavy body of revolution on a horizontal plane with friction are determined. The results are compared with those of similar investigations for the regular precession of bodies of revolution on smooth and rough surfaces. (8 refs.)

113268 On the stability of steady rotation of a cylinder partly filled with a viscous incompressible fluid. N.V.Derendiaev, V.M.Sandalov.

Appl. Math. & Mech. (USA), vol.46, no.4, p.458-64 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.578-86 (1982). [received: Sept. 1983]

The problem of stability in the case of steady rotation at constant angular velocity of a cylinder partly filled with viscous incompressible fluid with its axis held in viscoelastic supports is considered within the limits of a plane model. Taking into account the problem symmetry the authors reduce the conditions that define parameters for which a change of the system degree of instability occurs to conditions of existence of solutions of the equations in variations that define the circular precession of a cylinder containing a fluid. The exact solution of the hydrodynamic problem defines the forces exerted by the viscous incompressible fluid that partly fills the rotating cylinder under conditions of circular precession. Expressions for components of that force are used for dividing the parameter plane of the cylinder axis supports into regions of different degrees of instability. (6 refs.)

113269 On controlled rotation of an elastic rod. L.D.Akulenko, N.N.Bolotnik.

Appl. Math. & Mech. (USA), vol.46, no.4, p.465-71 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.587-95 (1982). [received: Sept. 1983]

Plane rotational motions of an elastic rod loaded by a perfectly rigid body and acted upon by a controlling force moment, are considered. A system of integro-differential equations with initial and boundary conditions is obtained. The problems of control are studied, which carried the system from some initial state to a given angular state with damping of elastic oscillations or to a state in which the system rotates as a whole with fixed angular velocity. These formulations appear in the course of considering a whole series of practical problems of controlling the systems with elastic constraints such as robots and manipulators, weight lifting machines, etc. The asymptotic methods are used to obtain the solution of the control problems stated, close to the two limiting cases: 1) the case of a weightless rod (quasistatic approximation) and 2) the case of high flexural rigidity. (11 refs.)

113270 Finite amplitude oscillations of a simple rubber support system. M.F.Beatty (Dept. of Engng. Mechanics, Univ. of Kentucky, Lexington, KY, USA).

Arch. Ration. Mech. & Anal. (Germany), vol.83, no.3, p.195-219 (1983). Exact solution of the nonlinear problem of undamped, finite amplitude, free vertical oscillations of a mass supported by a rubber spring made of a neo-Hookean material is presented for both suspension and compression supports. The motion in the special case of free fall of the mass from rest at the unstretched state is characterized in terms of elliptic integrals, and it is shown that the periodic time may be expressed universally in terms of the tabulated Heuman lambda-function. The finite amplitude, free vibrational frequency and the dynamic deflection of a neo-Hookean oscillator are compared with those for a linear spring oscillator having the same constant stiffness; and both upper and lower bounds on the ratio of these frequencies are presented. Numerical values for several cases are illustrated, and the physical results are described graphically. General solutions for the free vibrations with arbitrary initial data are obtained in terms of certain generalized lambda and beta-functions, and some transformation identities relating these functions are derived. (7 refs.)

113271 Solution of the axisymmetric problem of the torsion of an inhomogeneous layer. A.E.Puro (Kaliningrad Tech. Inst. of Fishing Industry & Economy, Kaliningrad, USSR).

Sov. Appl. Mech. (USA), vol.18, no.12, p.1071-5 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.31-5 (Dec. 1982). [received: Sept. 1983]

The solution of the axisymmetric problem of the torsion of a layer, inhomogeneous with respect to the axial coordinate, reduces to the solution of an ordinary second-order equation in Hankel space. The boundary-value problem was solved by finding the matrix of the corresponding first-order system. It is complicated to obtain a numerical solution as the parameter approaches infinity because the ratio of the elements of the matrix increases exponentially with increasing size. (5 refs.)

113272 Instability of gyrocompass with variable torques acting on wheel under resonance conditions. V.M.Vorob'ev.

Sov. Appl. Mech. (USA), vol.18, no.12, p.1138-44 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.102-7 (Dec. 1982). [received: Sept. 1983]

The author establishes the conditions under which nonlinear resonance vibrations of a gyrocompass are excited by variable perturbation torques acting on the wheel. The author also determines qualitatively the dependence of the system stability on the main gyrocompass parameters. (12 refs.)

- 113273 Finite-dimensional representation of model of solid body with attached elastic elements.** A.E.Zakrzhevskii (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.19, no.1, p.80-4 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.95-100 (Jan. 1983). [received: Sept. 1983]
Considers an object consisting of a solid carrier and elastic elements attached to it. The carrier is assumed to be in motion in such a way that the relative displacements of the elastic elements remain sufficiently small, so that only the terms which are linear with respect to elastic displacements need to be retained in the equations of this motion. (4 refs.)

- 113274 Two problems with mixed boundary conditions for an incompressible isotropic hyperelastic material.** V.M.Aleksandrov, S.R.Brudnyi. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.559-63 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.700-4 (1982). [received: Sept. 1983]
Within the framework of nonlinear elasticity theory there is considered the equilibrium of the layer of incompressible isotropic hyperelastic material under plane strain under the effect of gravity and forces P applied at infinity. The linearized equations generated by this state of stress and strain are investigated. It is shown that for relationships between the material parameters, layer thickness and the force P , the equilibrium position can become unstable. Two problems are considered: the contact problem for a strip and the problem of a vertical crack of finite length emerging on the half-plane boundary. The action of the stamp and the crack is considered as a small perturbation of the state of stress and strain caused by the action of the intrinsic weight and the force P . (7 refs.)
113275 A theory of shells with small strain accompanied by moderate rotation. P.M.Naghdi, L.Vongsarnpigoon (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA). *Arch. Ration. Mech. & Anal. (Germany)*, vol.83, no.3, p.245-83 (1983).
Concerned with a constrained theory of shells in the presence of small strain accompanied by moderate rotation. The constrained theory accounts for the effect of transverse normal strain and includes, of course, the special case (corresponding to the Kirchhoff-Love theory of shells) in which the effect of transverse normal strain is absent. After precise estimates for (local) moderate rotation and relative displacement gradients in terms of infinitesimal strain have been effected, a complete theory is formulated with the use of linear constitutive equations. The nature of the complete theory is further examined when initially the shell-like body is a plate; and it is shown that the kinematical formulae (strain-displacement relations), as well as the relevant differential equations of the theory in the absence of the effect of transverse normal strain, systematically reduce to those used in the von Karman plate equations. Also, in the light of the present results, an assessment of kinematical aspects of previously developed theories of shells undergoing small strain and moderate rotation is indicated. (16 refs.)
113276 Axial symmetrical problems for conical thin shells with linearly varying wall thickness. Chen Guodong (Tientsin General Paint Factory, China). *Acta Mech. Sin. (China)*, no.3, p.249-58 (1983). In Chinese.
Using the theory of thin shells, a basic equation in complex form is derived for conical thin shells with linearly varying wall thickness under symmetric load. Exact solutions are given. (5 refs.)
113277 On plane Prager-structures. I. G.I.N.Rozvany (Dept. of Civil Engng., Monash Univ., Clayton, Victoria, Australia), C.-M.Wang. *Int. J. Mech. Sci. (GB)*, vol.25, no.7, p.519-27 (1983).
Prager-structures differ from classical least-weight trusses (or Michell continua) in two respects: the sign of all member forces must be the same and the vertical location of all external loads is to be optimized. A systematic method for constructing plane Prager-structures for any system of vertical loads is outlined and illustrated with examples. It is established at plane Prager-structures (a) always consist of a single funicular and (b) the optimal elevation of the loads also provides an influence line for the minimum weight. (15 refs.)
113278 On plane Prager-structures. II. Non-parallel external loads and allowances for selfweight. C.-M.Wang (Dept. of Civil Engng., Nat. Univ. of Singapore, Kent Ridge, Singapore), G.I.N.Rozvany. *Int. J. Mech. Sci. (GB)*, vol.25, no.7, p.529-41 (1983).
For pt.I see *ibid.*, vol.25, no.7, p.519-27 (1983). In part I of this study, the construction of plane Prager-structures for any parallel load system was outlined. In this paper, the same method is extended to non-parallel forces and a procedure for determining plane Prager-structures for any vertical load system plus selfweight is presented. (10 refs.)
113279 End stress calculations on elastic cylinders. P.J.D.Mayes (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England). *Int. J. Solids & Struct. (GB)*, vol.19, no.10, p.895-906 (1983).
For a semi-infinite circular elastic cylinder $z \geq 0$, $r \leq 1$ deformed solely by a distribution of stress and displacements on its flat end $z=0$, the Love stress function can be expanded in a series of eigenfunctions of known form. For problems in which suitable mixed stress and displacements boundary conditions are prescribed on $z=0$ the coefficients appearing in the expansion can be determined in an explicit form via sets of biorthogonal functions. When normal and shear stresses are prescribed on $z=0$ no such closed expressions for the coefficients exist and approximate methods usually lead to infinite systems of linear equations which are solved by truncation. Stability of solution as the order of truncation is increased can only be guaranteed theoretically when the infinite matrix is diagonally dominated, and this is not the case for existing methods. A Galerkin method has been developed using weighting functions chosen so as to optimise the diagonal dominance of the infinite matrix, and numerical results show that, although the resulting matrix is not completely diagonally dominated, the resulting coefficients show an improvement in stability in the sense that they do not change significantly as the order of truncation is increased. (11 refs.)
113280 Elastic response to a time-harmonic torsion-force acting on a bore surface. R.Parnes (Dept. of Solid Mech., Materials & Structures, School of Engng., Tel-Aviv Univ., Tel-Aviv, Israel). *Int. J. Solids & Struct. (GB)*, vol.19, no.10, p.925-34 (1983).
The response of an elastic medium to torsional line loads applied on the surface of a cylindrical cavity, and having a harmonic time-dependence, is studied. Integral representations of the stress and displacement fields are obtained and numerical results along a radial line emanating from the point of load applications and along the bore surface are presented. The dynamic

effect is represented by dynamic amplification factors and it is shown that, compared to the static case, the resulting outward radiating waves increase the effective radial penetration of the response. (8 refs.)

- 113281 Energy-consistent large rotating shell theories in Lagrangian description.** L.-P.Nolte, H.Stumpf (Lehrstuhl für Mech. II, Ruhr-Univ. Bochum, Bochum, Germany). *Mech. Res. Commun. (GB)*, vol.10, no.4, p.213-21 (July-Aug. 1983).
Presents two fairly simple versions of the geometrically nonlinear shell theories for large rotations, where the governing shell equations are the weak solution of the principle of stationary total potential energy. For these theories powerful approximating procedures such as finite element methods can be constructed. (6 refs.)
113282 An updated Lagrangian formulation for Timoshenko beams including non-conservative loads for divergence-type systems. K.-D.Klee, P.Wriggers (Inst. für Baumech. und Numerische Mech., Univ. Hannover, Hannover, Germany). *Mech. Res. Commun. (GB)*, vol.10, no.4, p.239-44 (July-Aug. 1983).
Attention is focused on non-conservative forces of the circulatory type for divergence-type systems, and their influence on a finite element formulation for beam structures. Forces of the circulatory type are velocity-independent, i.e. purely displacement-dependent, and belong to the class of polygenic forces. The finite element method presented, based on an updated Lagrangian (UL) formulation, has been proved to be a powerful tool for the solution of large displacement and rotation problems of beams. Circulatory forces lead i.g. to a non-symmetric load correction stiffness matrix. Since this work is limited to a large displacement-small strain analysis, a consistent linearization is carried out in order to obtain a simple and symmetric matrix formulation. Within this concept, no iteration process is necessary during a load step if the chosen load increment is sufficiently small. (3 refs.)
113283 Axisymmetric stress state of thick-walled elastic near-spherical shells. Yu.N.Nemish, D.F.Lyaluk, D.I.Chernopiskii (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.18, no.12, p.1059-65 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.18-24 (Dec. 1982). [received: Sept. 1983]
Investigates the stress state of thick-walled shells (of constant and variable thickness), nearly spherical, under the influence of internal pressure or centrifugal forces. The variant of the boundary form perturbation method is used to solve the boundary-value problems. (7 refs.)
113284 Calculation of the stress-strain state of a composite pressure cylinder with an elastic interlayer between the shell and flange. V.A.Nikituk. *Sov. Appl. Mech. (USA)*, vol.18, no.12, p.1075-9 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.36-40 (Dec. 1982). [received: Sept. 1983]
Looks into the problem of the effect of shear forces on the stress-strain state from the direction of an elastic interlayer, attached to the shell by means of a flange. (5 refs.)
113285 Optimizing reinforced cylindrical shells with local loads from strength conditions. V.P.Maksimenco (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.18, no.12, p.1080-6 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.41-7 (Dec. 1982). [received: Sept. 1983]
Examines the problem of determining the minimum weight of a discretely reinforced cylindrical shell under the influence of local loads applied to a curvilinear contour. In the case considered, the number of ribs in both directions and their stiffness may differ, and their arrangement may be regular or irregular. The load can be assigned in accordance with almost any law. The problem is solved by the method of finite differences. (14 refs.)
113286 Phenomenon of internal instability in mixtures. Ya.Ya.Rushchitskii (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.18, no.12, p.1087-92 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.48-53 (Dec. 1982). [received: Sept. 1983]
Examines the internal instability of a mixture. By a mixture, the author means an idealized continuum consisting of two interpenetrating and interacting elastic continua. The author uses a linearized theory of mixtures for small strains and angles of rotation and also assumes that the main state is determined from linear mixture theory. (5 refs.)
113287 Linear theory of thin shells on the basis of the concept of added vectors. Ya.F.Kayuk, A.P.Zhukovskii (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.19, no.1, p.7-11 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.10-15 (Jan. 1983). [received: Sept. 1983]
The correspondence between the basic quantities of the linear variants of shell theory constructed taking the added-vector concept (AVC) into account and the well-known classical hypotheses is investigated. At the same time, it is shown how more general relations of thin-shell theory may be obtained on the basis of AVC by the uniform method than the traditional method (for example, according to the Timoshenko method). (5 refs.)
113288 Calculating shells of revolution with axisymmetric deformation. V.V.Pikul' (Inst. of Automation & Control Processes, DVNTs, Acad. of Sci., Vladivostok, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.19, no.1, p.19-24 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.24-30 (Jan. 1983). [received: Sept. 1983]
Using the familiar property of sloping-shell equations of describing the stress-strain state associated with the edge effect in nonsloping shells, along with features of the coordinate system in the simplest variant of the theory of sloping shells of Vlasov (1949), the author was able to find a single method of calculating nonsloping shells of revolution that does not involve their differentiation into separate regions. The formulas of this method turn out to be simpler than the well-known formulas, and they have the same degree of accuracy. (10 refs.)
113289 Numerical solution of axisymmetric problems of the dynamics of thin orthotropic shells of revolution. A.Kh.Valiullin (Kazan' Chem. Engng. Inst., Kazan, USSR). *Sov. Appl. Mech. (USA)*, vol.19, no.1, p.24-8 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.31-5 (Jan. 1983). [received: Sept. 1983]
Based on the equations of the nonlinear theory of shells, the author obtained equations to describe the axisymmetric motion of a thin shell of revolution. Having expressed the derivatives in finite differences and having combined the boundary-condition equations in their most general form a system of algebraic equations is derived. The system is linear for both linear and nonlinear problems. (6 refs.)

113290 Hybrid experimental-numerical stress analysis. A.S.Kobayashi (Dept. of Mech. Engng., Seattle, WA, USA). *Exp. Mech. (USA)*, vol.23, no.3, p.338-47 (Sept. 1983).

The hybrid experimental-numerical stress-analysis technique, which saw limited applications during the 1950s, has been resurrected with the vastly improved numerical techniques of the 1970s. By inputting the experimental results as initial and boundary conditions, modern computer codes are executed in its generation and application modes to yield results which are unobtainable when only one of the two techniques is used. The hybrid technique thus exemplifies the complementary role of the experimental and numerical techniques. (46 refs.)

113291 Design of continuous fiber composite structures. Crivelli Visconti (Istituto di Tecnol., Univ. di Napoli, Napoli, Italy).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.545-86

Discusses the most peculiar aspects of designing a composite structure, considering the properties of the material from a more general point of view and taking into account the influence of technology on the design. It is shown that a design must consider element mission, technological aspects, and material properties at the same time. (70 refs.)

113293 Dynamic response of orthotropic curved bridge decks due to moving loads. S.S.Dey (Dept. of Civil Engng., Indian Inst. of Technol., Kharagpur, India), N.Balasubramanian.

Comput. & Struct. (GB), vol.18, no.1, p.27-32 (1984).

The dynamic response of horizontally curved bridge decks simply supported along the radial edges under the action of the moving vehicle is investigated. The bridge deck is idealised as a number of finite strips with orthotropic elastic properties. The stiffness and mass matrix of an individual element were derived using a homogeneous differential equation of an orthotropic plate in polar co-ordinates. The vehicle is idealised as a sprung mass moving at a constant speed in a circular path parallel to the central line of the bridge. The unsprung mass of the vehicle is assumed to be always in contact with the bridge surface during its motion. Viscous damping is taken into account for both bridge and vehicle. Dynamic deflections and moments are presented for the mid-point of the bridge deck and the values have been compared with the available analytical solution. (16 refs.)

113294 Alternate stress and conjugate strain measures, and mixed variational formulations involving rigid rotations, for computational analyses of finitely deformed solids, with application to plates and shells. I. Theory. S.N.Atluri (Center for the Advancement of Computational Mech., Georgia Inst. of Technol., Atlanta, GA, USA).

Comput. & Struct. (GB), vol.18, no.1, p.93-116 (1984).

Attention is focused on: (i) definitions of alternate measures of 'stress-resultants' and 'stress-couples' in a finitely deformed shell (finite mid-plane stretches as well as finite rotations); (ii) mixed variational principles for shells, undergoing large mid-plane stretches and large rotations, in terms of a stress function vector and the rotation tensor. In doing so, both types of polar decomposition, namely rotation followed by stretch, as well as stretch followed by rotation, of the shell midsurface, are considered; (iii) two alternate bending strain measures which depend on rotation alone for a finitely deformed shell; (iv) objectivity of constitutive relations, in terms of these alternate strain/stress-resultants, and 'stress-couple' measures, for finitely deformed shells. To motivate these topics, and for added clarity, a discussion of relevant alternate stress measures, work-conjugate strain measures, and mixed variational principles with rotations as variables, is presented first in the context of three-dimensional continuum mechanics. Comments are also made on the use of the presently developed theories in conjunction with mixed-hybrid finite element methods. (34 refs.)

113295 Variation of stress resultants in concrete structures due to time-dependent creep and shrinkage strains of concrete. G.D.Stefanou (Univ. of Patras, Patras, Greece).

Comput. & Struct. (GB), vol.18, no.1, p.117-26 (1984).

A general procedure for calculating the variation with time of the internal stress resultants, and hence the stresses, in concrete structures is discussed. In particular, a study is made of the changes in the stress resultants due to time-dependent creep and shrinkage strains of concrete. A general procedure of calculating the variation in the stress resultants due to differential creep strains in concrete structures has been proposed by the author (1981). A similar procedure is followed in this paper to study these variations when creep and shrinkage strains take place simultaneously. The method leads to a system of n -linear differential equations of the form: $\dot{X} = AX + B$ the solution of which is performed by a computer using Runge-Kutta numerical procedures. A reinforced concrete portal frame exhibiting creep and shrinkage strains is solved by the proposed method and the results are given in tabular and graphical form. (6 refs.)

113296 Nonlinear viscoelastic stress analysis—a finite element approach. M.Henriksen (Dept. of Mech. Engng., Texas A&M Univ., College Station, TX, USA).

Comput. & Struct. (GB), vol.18, no.1, p.133-9 (1984).

This paper describes a finite element algorithm developed for analysis of nonlinear viscoelastic materials. A single integral constitutive law proposed by Schapery (1969) is used to describe viscoelastic material behavior. Work leading to this paper focused on adhesives, but the FE formulation is general and readily extended to structural systems other than plane strain, plane stress and axisymmetric analysis as described. Cartesian strain components are written in terms of current and past stress states. Thus strains are conveniently

defined by a stress operator that includes instantaneous compliance and hereditary strain which is updated by recursive computation. Equilibrium at each time step is insured with a modified Newton Raphson technique, incorporating convergence acceleration. Verification analyses show excellent agreement with experimental data for FM-73 adhesive systems. A plane strain analysis of a butt joint is included. (18 refs.)

113297 Minimum mass design of elastic frames subjected to multiple load cases. P.Pedersen, L.Jorgensen (Dept. of Solid Mech., Tech. Univ. of Denmark, Lyngby, Denmark).

Comput. & Struct. (GB), vol.18, no.1, p.147-57 (1984).

For frames with stress- and displacement constraints subjected to multiple load cases the formulation is given that enables use of the unified optimization approach which combines finite element and linear programming. Sensitivity analysis is shown analytically for Timoshenko beam models with transformations for eccentricities. For a specific case of a portal frame for a crane a study is made of the influence of the given portal columns (boundary conditions), the relations to fully stressed designs, and the influence of slenderness, when displacement constraints are involved. (9 refs.)

113298 A direct solution of the equivalent frame for two-way slabs. F.Arbabi (Michigan Technol. Univ., Houghton, MI, USA).

Comput. & Struct. (GB), vol.18, no.1, p.159-64 (1984).

A common procedure for the analysis of concrete buildings with two-way slabs is to reduce the slab along with other components of the building to a series of equivalent frames representing portions of the building between center-lines of spans. This paper presents a direct solution of the equivalent frame. Variations of slab geometry, flexural and torsional beams as well as columns are included in the model considered. The equations derived are cast into a short computer program which can be used for the design of concrete buildings with flat plate, flat slab, and two-way slabs with beams. (7 refs.)

113299 A convergence theorem for a periodic media with thermoelastic properties. G.I.Pasa (Dept. of Math., INCREST, Bucharest, Rumania).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1313-19 (1983).

The equations of the linear thermoelasticity for the media with periodic structure have been obtained by Ene (see *ibid.*, vol.21, no.5, p.443, 1983). The author proves that the asymptotic process $\epsilon \rightarrow 0$ is convergent and that in the limit the equations are those of Ene. (5 refs.)

113300 On the role of the strong ellipticity condition in nonlinear elasticity. M.Aron (Dept. of Math., Plymouth Polytech., Plymouth, England).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1359-67 (1983).

The author shows that if an elastic material is strongly elliptic on certain subdomains of the domain of the strain energy function then, provided that a mild boundedness condition (which may be regarded as restricting the class of considered materials) is satisfied, the nominal work of the deformation and the strain energy must satisfy certain growth conditions on these subdomains. The author uses the growth conditions to find upper and lower bounds for solutions to the boundary value problem of place (with dead loading) which belong to the considered subdomains. If the ellipticity condition is not satisfied at all points of the considered subdomains the author shows that the strain energy may satisfy certain inequalities which are shown to imply the Liapunov instability of equilibrium solutions to the boundary value problem of place and the fact that solutions to the dynamical problem cannot exist globally in time for arbitrary initial data. (35 refs.)

113301 The micropolar thermoelastic problem of uniform heat-flow interrupted by an insulated penny-shaped crack. K.Sridharan (Dept. of Math., Pachaiyappa's Coll., Madras, India).

Int. J. Eng. Sci. (GB), vol.21, no.12, p.1459-69 (1983).

The classical problem of uniform heat-flow disturbed by an insulated penny-shaped crack is solved in the context of micropolar elasticity. The mode II stress intensity factor, K_{II} is found to depend on two new non-dimensional parameters N and τ . N is a measure of the coupling of the displacement field with the microstructure of the medium ($0 \leq N \leq \sqrt{2}$) and τ is the ratio of a material characteristics length to the crack radius. K_{II} remains higher than its classical value when $N > 0, \tau > 0$ and attains the classical value as N and τ vanish. A closed-form expression to K_{II} is obtained in the physically important limiting case of $\tau \rightarrow 0$ with N fixed. In this limit the relative increment in K_{II} , over its classical value, is found to be $(1-\nu')N^2$ where ν' is the micropolar Poisson's ratio. (16 refs.)

113302 Integrated photoelasticity of cylindrical bodies with measurement of the deviation of light beams. Kh.K.Aben (Inst. of Cybernetics, Acad. of Sci., Tallinn, Estonian SSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1068-9 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.812-14 (Dec. 1982). [received: Sept. 1983]

In the method of photoelasticity it is usually assumed that light passes rectilinearly through the sample. However, because of the nonuniform distribution of the dielectric tensor in photoelastic materials, the light rays will deviate somewhat from straight lines. This deviation can amount to several mrad and can sometimes affect the experimental data. The author considers the transillumination of a transverse cross section of a cylinder in an axisymmetric stress state with no stress gradient in the axial direction. (10 refs.)

113303 Torsion of a rectangular beam with circular cavities. O.P.Orzhikhovskaya (Zhdanov Evening & Extramural Faculty of OIIMF, Zhdanov, USSR).

Strength Mater. (USA), vol.14, no.11, p.1494-7 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.61-3 (Nov. 1982). [received: Sept. 1983]

A homogeneous isotropic beam weakened by a number of equal longitudinal cylindrical cavities is examined. The cross section of the beam is a rectangle with a number of circular holes whose centers lie on the axis of symmetry of the rectangle and at the distance l from each other. The beam is twisted by the moment M . The problem of determined the state of stress of such a beam is investigated. (3 refs.)

113304 Stress state of a heated flattened spherical shell caused by thermal diffusion. R.N.Shvets, M.S.Ravrik, A.L.Bichuya (Inst. of Appl. Problems of Mech. & Math., Acad. of Sci., Ukrainian SSR).

Strength Mater. (USA), vol.14, no.11, p.1509-15 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.72-6 (Nov. 1982). [received: Sept. 1983]

It is concluded that there is a specific range of oscillation frequency for temperature of the environment at which the steady force amplitude takes on the maximum value, and this should be considered in the design of thin-walled structural elements for thermal fatigue. Consideration of diffusion processes and diffusion reactions at the test body with the working medium has a marked effect on the magnitude and nature of stress state distribution with time. (8 refs.)

113305 Effect of shear modulus on the elastic behavior of strongly anisotropic plates. Yu.A.Bogan (Inst. of Hydrodynamics, Acad. of Sci., Novosibirsk, USSR). *Strength Mater. (USA)*, vol.14, no.11, p.1518-23 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.79-83 (Nov. 1982). [received: Sept. 1983]
Investigates the strongly anisotropic elastic properties of modern fiber-composite materials. (6 refs.)

113306 Computation of imperfection-sensitivity at two-fold branching points. Z.Gaspar (Dept. of Civil Engng., Tech. Univ. of Budapest, Budapest, Hungary). *Z. Angew. Math. & Mech. (Germany)*, vol.63, no.8, p.359-70 (1983).
There is a degenerate critical point (usually illoptic or hyperbolic umbilic) of the potential function of semisymmetric conservative systems in the case of a two-fold branching point. The bifurcation set of a standard form is known in both cases in a parametrized form. In an imperfection-sensitivity examination the relevant critical point is regarded as the first one reached by a continuously changing load, starting from a stable equilibrium state. The coordinate system of the imperfection-sensitivity surface is transformed so that it coincides with a part of the bifurcation set of the standard form. Analysis of this reveals imperfections which decrease the critical load. Algorithms are given to compute these decreases. Finally the different possible forms of the equilibrium paths are sketched. 46.30J Viscoelasticity, plasticity, viscoplasticity, creep, and stress relaxation
(inc. rheology of solids)

113307 Contact problem for a two-layer aging viscoelastic foundation. E.V.Kovalenko, A.V.Manzhirov. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.536-42 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.674-82 (1982). [received: Sept. 1983]
A solution is given for the problem of the frictionless impression of a stamp into a two-layered aging viscoelastic strip in the case of plane strain. The upper layer is thin. The lower layer is hinge-fixed along the foundation. It is assumed that the layers are in contact without friction, that the forces acting on the stamp and the domain of contact do not change with time, that the rheological properties of the layers are described by the equations of the linear creep theory of aging materials and that the layers are fabricated at different times. (10 refs.)

113308 Strength optimization of the shape of a viscoelastic inhomogeneously-aged reinforced rod. L.V.Genkin, V.B.Kolmanovskii. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.543-9 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.683-90 (1982). [received: Sept. 1983]
Examines the problem of selecting the shape of a minimal volume rod for which normal stresses in the reinforcements and the main material do not exceed given values. Relationships are established that govern the optimal shape. The dependence of the optimal shape on the magnitude of the bending moment and functions characterizing the inhomogeneity of the aging is studied. Results are presented of numerical computations. (5 refs.)

113309 Note on the applications of the Frechet derivative. J.L.Nowinski (Dept. Mech. & Aerospace Engng., Univ. of Delaware, Newark, DE, USA). *Int. J. Non-Linear Mech. (GB)*, vol.18, no.4, p.297-306 (1983).
A brief review of the main concepts underlying the operation of differentiation of non-linear mappings is followed by examples of the application of the operation; two of the five examples given concern the theory of the non-linear viscoelasticity and the theory of the non-linear non-local elasticity. (29 refs.)

113310 On the characteristic equations of elasto-plastic flow. R.M.Guo, J.L.Swedlow (Dept. of Mech. Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA). *Int. J. Non-Linear Mech. (GB)*, vol.18, no.4, p.321-34 (1983).
Three dimensional characteristic surfaces (slip surfaces) of elasto-plastic Navier's equations and the criteria for their existence are discussed, and the solutions are also applied to two dimensional cases. By making use of isotropic yield function, the following results proved. If, and only if the plastic/elastic moduli ratio is zero and $\text{Det}(\phi_{ij})=0$, ($\phi_{ij}=\partial\phi/\partial\sigma_{ij}$; yield function, σ_{ij} : stress tensor), characteristic surfaces exist. There are two and only two characteristic surface elements at each point, and they are identical with the surfaces of maximum shearing stress. (10 refs.)

113311 A plasticity theory for fluid-saturated porous solids. R.de Boer (Fachgebiet Mech., Univ.-GH-Essen, Essen, Germany), S.J.Kowalski. *Int. J. Eng. Sci. (GB)*, vol.21, no.11, p.1343-57 (1983).
A theory of plastic flow is developed for an elastic-perfectly plastic porous solid with its intercommunicating void spaces filled with a viscous fluid. The constitutive equations are established where full use is made of the thermodynamical equations. The final result is the complete set of equations of the theory and the boundary conditions for the medium in question. (18 refs.)

113312 Isotropic stochastic visco-elastic strain modelled as a second moment white noise field. O.Ditlevsen (Danmarks Ingeniorakademi, Lyngby, Denmark). *Int. J. Solids & Struct. (GB)*, vol.19, no.10, p.873-83 (1983).
Constitutive equations for statistically isotropic triaxial visco-elastic stochastic creep are formulated by generalized from a previous formulated theory of uniaxial stochastic creep. The constitutive equations define a random strain tensor as a function of a given deterministic stress tensor history. Compatibility constraints imply that stresses become random even for a deterministic external load history. In order to reach solutions in terms of means and covariances it turns out to be necessary to linearize the constitutive equations with respect to the stress tensor increments. This Part 1 of the paper terminates by discussing some solutions of relevance for comparisons with the uniaxial theory of combined elongation and bending of slender prismatic bodies. Part 2 discusses solutions for biaxial stress histories that are homogeneous in the mean. (5 refs.)

113313 Conservation laws for material exhibiting power-law creep. T.J.Delph (Lehigh Univ., Bethlehem, PA, USA). *Int. J. Solids & Struct. (GB)*, vol.19, no.10, p.907-13 (1983).
Conservation laws are derived for materials whose constitutive behavior is characterized by power-law creep with elastic strains. This is accomplished by formulating an adjoint variational principle which has as its Euler-Lagrange equations the governing equations as well as a set of adjoint equations involving adjoint variables. Conservation laws are then derived by an application of Noether's theorem to the variational principle. The results are analogous to those obtained in linear elasticity, in that conservation laws are shown to arise from translations of spatial and temporal coordinates, rigid-body rotations, and self-similar scalings. A path-independent integral formulation of one of the conservation laws, valid under special circumstances, is derived. (24 refs.)

113314 'Frictional slip between a layer and a substrate due to a periodic force' by M. Comninou and J.R. Barber, *Int. J. Solids Structures* 19(6), 533-539 (1983). K.L.Johnson (Engng. Lab., Cambridge Univ., Cambridge, England). *Int. J. Solids & Struct. (GB)*, vol.19, no.10, p.935-6 (1983).
Looks further at the question of shakedown in frictional systems raised in the paper by Comninou and Barber. To the author's knowledge the equivalent of Molan's theorem in slipping systems has not been proved and so the author puts it to an empirical test in the case outlined by Comninou and Barber. (3 refs.)

113315 Biaxial unsteady strain of a rectilinear strip in the scheme of a compressible viscoplastic medium. S.V.Serikov. *J. Appl. Mech. & Tech. Phys. (USA)*, vol.23, no.6, p.850-5 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.123-9 (Nov.-Dec. 1982). [received: Sept. 1983]
The exact solution of a mathematical model for unsteady strain of a rectilinear strip under tension is determined with a linear velocity field and with zero tangential stress in the scheme of a compressible viscoplastic medium. Analytical dependences are deduced to estimate the strip rupture time. The existence of a plasticity peak is noted. (11 refs.)

113316 Approximate calculation of binding forces for plastic flows. M.Abouaf, J.L.Chenot, J.J.Perouze (CEMEF, Ecole des Mines de Paris, Valbonne, France). *Mech. Res. Commun. (GB)*, vol.10, no.4, p.187-92 (July-Aug. 1983).
The kinematic method of limit loads theory (or upper bound method) has always been used for the determination of active loads. The authors propose its utilization for the calculation of reactions by introducing the (virtual) displacements prohibited by these constraints. As an example the authors calculate the reaction exerted on rolling mill rolls. (5 refs.)

113317 Bending of plates based on improved theory. K.Shirakawa (Dept. of Mech. Engng., Univ. of Osaka Prefecture, Sakai, Japan). *Mech. Res. Commun. (GB)*, vol.10, no.4, p.205-11 (July-Aug. 1983).
The plate theory which is not based on the Kirchhoff assumptions has been developed by Reissner (1945, 1975) and Ambartsumyan (1970) by taking into account the effects of shear deformation and normal stress. This so-called improved theory is the one to complement the classical plate theory and the extend its range of application. The author uses the Ambartsumyan theory, and finds that the resulting equation is quite the same as that in Reissner theory. The statical equation including both effects is presented in terms of a single deflection which seem useful to the analysis of practically important problems. In the improved theory, even for a simply supported edge, there are methods of support, that is in addition to the classical boundary condition (a) rotation angle=0 or (b) twisting moment=0. It is in general not easy to obtain solutions in the case of (b). The author presents the analytical method for the basic problem for a rectangular plate with any boundary condition and the effects of shear deformation and normal stress on the deflection are examined and compared with the classical values. (5 refs.)

113318 Relaxation of a rectangular beam and circular shaft. N.S.Ottosen (Engng. Dept., Riso Nat. Lab., Roskilde, Denmark). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.67-72 (1982). [received: Sept. 1983]
Provides exact and approximate solutions to the title problems. Time-hardening creep is adopted and the stress dependence is assumed to follow the exponential expression proposed by Soderberg (1936). Even though the exact solutions are easy to work with, some approximate solutions are discussed. These approximate solutions are obtained from the exact ones by simply ignoring certain terms; errors bounds are then directly available. The exact and approximate solutions are applied to specific problems and compared with the predictions following the exact, numerical or approximate solution of Norton's power law. (13 refs.)

113319 Elasto-plastic behaviour of a thin cylinder under thermal stress cycling. S.Govindarajan (Reactor Design Section, Reactor Res. Center, Kalpakkam, India), V.Sundararajan. *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.87-98 (1982). [received: Sept. 1983]
A simple biaxial model is chosen to represent the stress state of a thin cylinder and the elasto-plastic behaviour under thermal stress cycling is studied to determine: shakedown limits, plastic cycling limits, magnitude of cyclic strains and ratchet strains, and strain ratios in various regimes. The studies have been carried out for two material models: elastic-perfectly plastic

and Prager-hardening. Results are given in the form of graphs and compared with the results of uniaxial models. (7 refs.)

113320 Generalized solutions of the dynamical theory of plasticity and thermoplasticity. B.A.Druyanov (All-Union Correspondence Inst. of Mech. Engng., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1026-7 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1073-5 (Dec. 1982). [received: Sept. 1983]

The author considers the dynamic flow of a hardening rigid-plastic medium, taking account of heat release and its effect on the plastic and thermodynamic potentials. (3 refs.)

113321 Inelastic torsion of plane rods. M.Ya.Leonov, V.D.Perederi (Automation Inst., Acad. of Sci., Frunze, Kirghiz SSR). *Strength Mater. (USA)*, vol.14, no.11, p.1490-3 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.58-60 (Nov. 1982). [received: Sept. 1983]

Investigates rods which, in pure torsion, have tangential-stress trajectories within the elastic limit that are close to the stress trajectories of the limiting state with ideal plasticity in every direction, in addition to fields with relatively small deformations, can be called plane. This condition is not satisfied only in the vicinity of an acute center of stress concentration; these cases are excluded from the investigation. (1 ref.)

113322 Torsion of rods of hardening material with almost-circular cross section. S.B.Maksimov, V.A.Lupin, A.A.Ost-semin, L.V.Maksimova (Ural Res. Inst. of Pipe Industry, Chelyabinsk, USSR). *Strength Mater. (USA)*, vol.14, no.11, p.1498-501 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.63-6 (Nov. 1982). [received: Sept. 1983]

The problem of torsion of hardening rods whose section is close to being circular or annular is solved by the perturbation method. Analytical dependencies for evaluating the state of stress and strain of hardening rods are suggested. (7 refs.)

113323 Elastic-plastic state of bodies of revolution under variable nonisothermal loading, taking account of creep. V.G.Savchenko (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.18, no.12, p.1053-8 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.12-17 (Dec. 1982). [received: Sept. 1983]

Considers the axisymmetric stressed state of a body of compound meridional cross section which is subjected to unsteady heating and surface t_n and body K forces. In general the temperature of the medium T_{med} , the surface t_n and the body K forces, and the heat-transfer coefficient α may be known functions of the coordinates z, r, ϕ and the time t . Their time dependence is such that the temperature distribution generated in the body satisfies the heat-conduction equation and boundary conditions of the third kind, and the thermoplasticity problem can be treated in the quasistatic formulation. The thermophysical and mechanical characteristics of the material of the body are assumed to be temperature dependent. Under the action of the loads mentioned, loading processes may occur in the body along rectilinear trajectories or strain trajectories of small curvature. Finding the stress-strain state of a body of revolution during the heating process reduces to the problem of solving the heat-conduction equation to determine the temperature T of points of the body at given times, and the thermoplasticity problem to determine the stresses $\sigma_{zz}, \sigma_{rr}, \sigma_{\phi\phi}$ and σ_{zr} , the strains $\epsilon_{zz}, \epsilon_{rr}, \epsilon_{\phi\phi}, \epsilon_{zr}$, and the displacements w and u at specified times. (4 refs.)

113324 Approximate representation of the equations of viscoelasticity for vibrations with variable amplitude. I.K.Senchenkov (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.18, no.12, p.1065-70 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.25-30 (Dec. 1982). [received: Sept. 1983]

The application of physical and kinematic models for the simplification of the viscoelastic equations for a medium with memory was carried out. It was shown that for slow enough motion and also for a medium with fast (in some sense) relaxation, the very general viscoelastic equations can be approximated by differential equations. The author uses these two models in a somewhat different form to construct approximate viscoelastic equations in the linear and nonlinear cases, for vibrations with variable amplitude. (7 refs.)

113325 Study of the bending of a multilaminate plate on the basis of finite-shear theory. A.G.Bondar, A.O.Rasskazov (Kiev Automobile Road Inst., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.18, no.12, p.1097-101 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.59-63 (Dec. 1982). [received: Sept. 1983]

In designing multilaminate orthotropic plates and sloping shells in which the layers differ significantly in their physical characteristics, it is necessary to consider the phenomenon of transverse shear and normal compression. The use of classical hypotheses in designing this class of structures leads to intolerable errors. Accounting for transverse shear strains considerably complicates the equilibrium equations of multilaminate structures. In accordance with finite-shear theory, which makes it possible to take into account anisotropy and significant physical inhomogeneity among the layers of a packet, the bending of multilaminate plates is described by a system of three differential equations in partial derivatives with respect to the deflection of the reduction surface and the shear functions. (6 refs.)

113326 Elastic-plastic state of a coiled cylindrical shell loaded with internal pressure. L.A.Ilin, N.A.Lobkova (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.19, no.1, p.32-7 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.41-6 (Jan. 1983). [received: Sept. 1983]

A study was previously made of the character of slip and the stress-strain state of the layers of an infinite thin multilayer coiled shell under internal pressure during the elastic stage of its work. The shell was schematized as a multisheeted circular cylindrical surface with a finite stiffness in tension and zero stiffness in bending. The investigators studied different cases of slip in the coil in relation to the value of the coefficient of friction f between the layers. The present authors use the previous design method to study the elastic-plastic stress-strain state of a coiled shell made of an ideally elastic-plastic material. The study was conducted for large values of $f \geq \ln 2/2\pi \approx 0.110$. The statement by A.E. Babenko (1978) that the stress distribution is the same in the elastic and plastic states is untrue, and it stemmed from the fact that the strain compatibility conditions of the turns were not taken into account. (5 refs.)

113327 Limiting point load applied to an arbitrary point of a shell. A.S.Dekhtyar', L.B.Kotova (Kiev State Art Inst., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.19, no.1, p.37-41 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.47-51 (Jan. 1983). [received: Sept. 1983]

Considers a hollow, constant-thickness shell, rectangular in plan, which has arbitrarily fixed edges. Its mean surface has positive, negative, or alternating Gaussian curvature. The shell material follows the generalized logansen plasticity condition, proposing complete independence of the internal force factors in the limiting state. In the particular case under the action of a vertical load and momentless fixing of the edges, it is usually assumed that the displacement $U=V=0$, and then all that is required for minimization of K is the selection of the field of flexure rates. Essentially, it is the choice of the configuration of the field $W(x,y)$ which is the distinctive feature of the problems considered, distinguishing them from problems of the limiting analysis of rigid-plastic shells with large—for example, distributed—loads. 46.30L Static buckling and instability

113328 Generic buckling curves for specially orthotropic rectangular plates. E.J.Brunelle, G.A.Oyibo (Rensselaer Polytech. Inst., Troy, NY, USA).

AIAA J. (USA), vol.21, no.8, p.1150-6 (Aug. 1983).

Using a double affine transformation, the classical buckling equation for specially orthotropic plates and the corresponding virtual work theorem are presented in a particularly simple fashion. These dual representations are characterized by a single material constant, called the generalized rigidity ratio D^* , whose range is predicted to be the closed interval from 0 to 1 (if this prediction is correct then the numerical results using $D^* > 1$ in the specially orthotropic plate literature are incorrect); when natural boundary conditions are considered a generalized Poisson's ratio ϵ is introduced. Thus the buckling results are valid for any specially orthotropic material; hence the curves presented in the text are generic rather than specific. The solution trends are twofold: the buckling coefficients decrease with decreasing D^* and, when applicable, they decrease with increasing ϵ . Since the isotropic plate is one limiting case of the above analysis, it is also true that isotropic buckling coefficients decrease with increasing Poisson's ratio. (21 refs.)

113329 Postbuckling behavior of a thick plate. Lien-Wen Chen, Ji-Liang Doong (Nat. Cheng Kung Univ., Tainan, Taiwan).

AIAA J. (USA), vol.21, no.8, p.1157-61 (Aug. 1983).

The postbuckling behavior of a simply supported rectangular thick plate subjected to arbitrary loading conditions is investigated. The applied stress is taken to be a combination of a pure bending stress plus an extensional stress in the plane of the plate. Governing equations based on von Karman assumptions are used to solve the postbuckling problems by the Galerkin method. Buckling loads are obtained to compare with the results of Brunelle and Robertson (1974). Postbuckled deflection is shown to increase with the transverse isotropic coefficient S , and the effects of the in-plane bending stress are found to be quite significant for a thick plate. (14 refs.)

113330 Buckling of sinusoidally corrugated plates under axial compression. S.Toda (Nat. Aerospace Lab., Tokyo, Japan).

AIAA J. (USA), vol.21, no.8, p.1211-13 (Aug. 1983).

The author presents an analytical explanation of the buckling characteristics of sinusoidally corrugated plates under axial compression. Assuming that the buckling deflection components are in the form of a Fourier series, the second increment of the potential energy is evaluated with the aid of linear shell theory. Then the eigenvalue equations for neutral equilibrium are obtained by variations in the potential energy. An approximate but closed-form solution is presented for the critical axial compressive stress. (4 refs.)

113331 Method of averaging in the problems of stability of elastic plates possessing fine periodic structure. S.I.Boiarchenko, L.M.Zubov.

Appl. Math. & Mech. (USA), vol.46, no.4, p.513-19 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.647-54 (1982). [received: Sept. 1983]

Studies the buckling of an elastic plate with mechanical properties inhomogeneous across its thickness. The character of the inhomogeneity is

described by periodic rapidly oscillating functions of the transverse coordinate. The method of averaging is used to construct an asymptotic to the solution of the problem of stability in the case when the period of the inhomogeneity oscillations tends to zero. An averaged system of differential equations is obtained in the case of a homogeneous (affine) subcritical deformation, separately, for the case of a compressible and an incompressible materials. The system is used for determining, in the given approximation, the bifurcation values of the load parameters. The general theory is illustrated by an example of computing the stability of a rectangular plate uniformly compressed in its plane, with the plate made of a resin-like incompressible one-constant material, the modulus of elasticity of which is a rapidly oscillating function of the transverse coordinate. The results obtained using the method of averaging are compared, for a thin plate, with those of the buckling theory based on the Kirchhoff hypothesis. (10 refs.)

113332 On the transition from a diamond mode to an axisymmetric mode of collapse in cylindrical shells. V.Tvergaard (Dept. of Solid Mech., Tech. Univ. of Denmark, Lyngby, Denmark).

Int. J. Solids & Struct. (GB), vol.19, no.10, p.845-56 (1983).

The influence of buckling pattern localization on the collapse mode of axially compressed elastic-plastic circular cylindrical shells is investigated. Initial imperfections are assumed to be axisymmetric and the possibility of bifurcation into a non-axisymmetric shape is analysed. For sufficiently thin-walled shells bifurcation occurs before the load maximum: but in more thick-walled shells the axisymmetric deformations are stable beyond the maximum load, at which localization into a single outward buckle takes place. It is found that the localization delays bifurcation considerably, such that sufficiently thick-walled shells will collapse in an axisymmetric mode. The theoretical predictions are compared with a number of published experimental results. (16 refs.)

113333 Stability of flexible sloping shells in a temperature field. L.F.Vakhaeva, V.A.Krys'ko (Saratov Polytech. Inst., Saratov, USSR). *Sov. Appl. Mech. (USA)*, vol.19, no.1, p.12-18 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.16-23 (Jan. 1983). [received: Sept. 1983]

Investigates the stability of flexible sloping shells, rectangular in plan, under the influence of different loads and temperatures. The initial equations of thermoelasticity for sloping shells were obtained using the following assumptions: the material of the structure obeys Hooke's law, the Kirchhoff-Love hypothesis is valid, and E , ν , and α are independent of temperature. The method developed makes it possible to study the stability of shells under the influence of any possible temperature field without making assumptions on the law of temperature distribution. Instead, the distribution is obtained from a three-dimensional heat conduction equation with assigned boundary conditions and an assigned heat-flux distribution. (5 refs.)

113334 Stability of thin-walled ribbed conical shells. G.D.Gavrilenko (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.19, no.1, p.28-32 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.36-40 (Jan. 1983). [received: Sept. 1983]

Examples of calculating the stability of specific thin-walled ribbed conical shells with consideration of the discreteness of the rib placement are provided. The calculations are based on the assumptions of momentlessness and uniformity of the subcritical stress state. (5 refs.)

113335 Buckling of beam under compression and torsion beyond elastic limit. V.S.Davydov (Sci.-Res. Correspondence Inst. of Economics & Planning, Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.19, no.1, p.68-74 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.82-8 (Jan. 1983). [received: Sept. 1983]

The need to account for complexity of loading conditions during loss of stability beyond the elastic limit was for the first time pointed out by Il'yushin (1963). Subsequent studies have revealed that different theories of plasticity yield different solutions to the problem of buckling of a beam under compression and torsion. In this study the problem is solved on the basis of the relations, in general form, between stresses and strains during loss of stability after prior simple loading. (13 refs.)

113336 Simple waves in nonlinearly elastic media. E.I.Sveshnikova. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.509-12 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.642-6 (1982). [received: Sept. 1983]

Plane isentropic waves (simple waves) are studied in the prestressed medium. The author determines the variation in the parameters of simple waves in a prestressed medium together with the characteristic velocities, and their dependence on the current state of the medium and on the prior deformation. It is shown that all three waves (one quasilongitudinal and two quasitransverse) can break, and conditions under which this can happen are given. (3 refs.)

113337 Effects of uni-directional geometric imperfections on vibrations of pressurized shallow spherical shells. D.Hui, A.W.Leissa (Dept. of Engng. Mech., Ohio State Univ., Columbus, OH, USA).

Int. J. Non-Linear Mech. (GB), vol.18, no.4, p.279-85 (1983).

Deals with the effects of initial geometric uni-directional imperfections on vibrations of a pressurized spherical shell or spherical cap. The analysis is based upon shallow shell theory. Frequency vs. applied pressure interaction curves are plotted for various values of the imperfection amplitude. Imperfections are shown to have a severe effect in reducing the natural frequencies similar to that demonstrated in the buckling behavior of spherical shells. (13 refs.)

113338 Note on the propagation of Love waves in a half-space with an elastic triple superficial layer subject to a high two-dimensional stress. H.Ohnabe (Ishikawajima-Harima Heavy Industries Co. Ltd., Tokyo, Japan), F.Mizuguchi.

Int. J. Non-Linear Mech. (GB), vol.18, no.4, p.307-12 (1983).

The propagation of Love waves is investigated involving a triple superficial layer on a half-space, the entire system being elastic and highly stressed in two horizontal directions. The non-linear problem is illustrated numerically. A graph displays the phase velocity dependence on the wavelength. (4 refs.)

113339 Love type waves in a porous layer with irregular interface. A.Chattopadhyay, R.K.De (Dept. of Phys. & Math., Indian School of Mines, Dhanbad, India).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1295-303 (1983).

The dispersion equation is derived relating to the frequency and the phase velocity of propagation of Love waves in a nondissipative liquid filled porous solid underlain by an isotropic and homogeneous half space. The rectangular irregularity in the interface between the upper porous layer and the lower semi-infinite medium with a source in it is studied herein. The modified dispersion equation of Mal (1962) and the standard dispersion equation of Love waves are deduced as particular cases. The frequency equation is obtained by applying the method of perturbation and the phase velocity curves have been drawn for different irregularities by using the numerical parametric values as suggested by Biot (1956). (14 refs.)

113340 Nonlinear surface waves on an elastic solid. R.W.Lardner (Dept. of Math. Sci., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1331-42 (1983).

The effect of quadratic elastic nonlinearity on the propagation of surface Rayleigh waves on an isotropic elastic solid is examined. Using the method of multiple scales an approximate solution is obtained which is uniformly valid in both spatial directions as well as in time. An arbitrary wave profile is considered and an integro-differential equation is derived for the Fourier transform of the displacement on the boundary. In the case of a quasi-monochromatic wave explicit expressions are derived for the variations of the amplitudes of the fundamental and second and third harmonics along the boundary. (11 refs.)

113341 Elastic waves generated by loading applied to surface of spherical cavity. T.B.Moodie, A.Mioduchowski, J.B.Haddow, R.J.Tait (Univ. of Alberta, Edmonton, Alberta, Canada).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1369-78 (1983).

The elastodynamic problem of an unbounded body, subjected to a rotationally symmetric application of tractions at the surface of a spherical cavity, is studied. In general this problem involves three independent variables, which are the radius, colatitude and time but it is shown how the method of characteristics for one spatial variable and time can be applied when the dependent variables are expanded as series of Legendre polynomials. The procedure is different to those employed previously in that it does not involve integral transforms or asymptotic approximations and the field variables can be obtained for small and large times. (6 refs.)

113342 Crack transient torsional wave interaction in an elastic bi-material. O.D.George (Dept. of Math., Univ. of Calabar, Calabar, Nigeria).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1379-95 (1983).

An infinitely long cylindrical elastic solid of finite radius is imbedded in another infinite elastic cylindrical solid to form an elastic bi-material composite perfectly bonded at their bi-material interface. The early-time response of the composite to a sudden twist applied axisymmetrically over a stationary penny-shaped crack which appears over a cross-section of the fibre and terminates orthogonally at the bi-material interface, is investigated. The magnitude of the applied twist is assumed to be less than that for which debonding or crack propagation can take place. For a bi-material composite the square of whose matrix shear-wave speed is less than twice the square of the fibre shear-wave speed, uniform asymptotic analytic results, whose accuracy can be improved by taking higher order terms in the solution, are obtained for the time-dependent surface displacement gradient normal to the plane of the crack and outside the crack region, the dynamic stress intensity factor, and also the stress singularity strength eigenvalue—all as functions of the fibre-matrix material disparities. (16 refs.)

113343 Torsional oscillations of a finite inhomogeneous piezoelectric cylindrical shell. K.Venkateswara Sarma (Dept. of Math., PSG Coll. of Arts & Sci., Coimbatore, India).

Int. J. Eng. Sci. (GB), vol.21, no.12, p.1483-91 (1983).

Torsional wave motion of a finite right circular cylindrical shell of inhomogeneous piezoelectric material of (622) crystal class under time independent electric potential on the boundary is investigated. The inhomogeneity is restricted to the variations of density and other physical constants of the medium as $\exp(f(r))$ where f is a suitable function of the radial distance. (5 refs.)

113344 Diffraction of Rayleigh waves in a quarter-space. V.K.Kinra, B.Q.Vu (Aerospace Engng. Dept., Texas A&M Univ., College Station, TX, USA).

Mech. Res. Commun. (GB), vol.10, no.4, p.193-8 (July-Aug. 1983).

The authors consider a plane Rayleigh wave incident at the corner of a quarter-space. Upon diffraction, it is partly reflected and partly transmitted; the remainder of the energy is propagated into the interior in the form of body waves. Let u_0 , u_i , u_r , u_t be, respectively, the amplitudes of the vertical motion associated with the incident, the transmitted, and the reflected Rayleigh waves. The authors define the transmission coefficient $A_t = u_t/u_0$ and the reflection coefficient $A_r = u_r/u_0$. Calculation of A_t and A_r is a classical problem in elastodynamics and has been studied extensively. Yet this canonical problem has, to date, defied an exact solution. A partial compendium of the results available in the literature is presented. Evidently there is substantial disagreement amongst the theoretically, the numerically, and the experimentally produced results. This provided the motivation for carrying out the present experiments. The authors have measured A_t and A_r accurate to about 3%. These are found to be in very good agreement with some of the most recent numerical and analytical results. (13 refs.)

113345 Energy balance equations describing point sources of elastic waves in a continuously varying medium. A.P.Kiselev (Rudgeofizika Sci. & Industrial Union, Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.139-42 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.224-9 (Feb. 1983). [received: Sept. 1983]

The energy distribution of longitudinal and transverse high-frequency modulated oscillations is studied. The oscillations are excited by various types of fixed point sources, and problems involving a localized force, a center of expansion and a center of rotation are examined. Transverse wave excitation when an expansion center is present and longitudinal wave excitation when a rotation center is present are second-order effects. (7 refs.)

113346 Propagation of elastic-plastic compression-shear waves in materials having delayed yield. N.Zh.Zhubaev, A.Ya.Sinyayev, N.P.Stepanenko (Inst. of Seismology, Acad. of Sci., Alma-Ata, Kazakh SSR).

Sov. Appl. Mech. (USA), vol.19, no.1, p.63-8 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.76-81 (Jan. 1983). [received: Sept. 1983]

The effect of yield delay refers to phenomena of hereditary type. The true dynamic yield stress, corresponding to an infinitely large strain rate, and the lower yield stress, attained after elastic unloading, are determined from theory. In the present study, where biaxial dynamic loading is considered, the instantaneous and lower yield surfaces are determined from experimental data obtained from uniaxial dynamic extension of thin rods. (5 refs.)

113347 Nonlinear oscillations of weakly asymmetric elastic systems with several degrees of freedom. L.N.Pokrovskii (Moscow Evening Metall. Inst., Moscow, USSR).

Sov. Appl. Mech. (USA), vol.19, no.1, p.85-91 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.101-8 (Jan. 1983). [received: Sept. 1983]

By asymmetric elastic systems the author means constructions of the type of sloping shells and membranes, sloping arches and flexible filaments, sloping guying systems, etc. The nonlinear oscillations of these systems is described by a system of coupled differential equations. A solution to the differential equation (under certain conditions) is obtained without restricting the number of the generalized coordinates considered. A definite relation is established between the oscillations of the asymmetric and the corresponding symmetric systems and an estimate given of the connectedness of the generalized coordinates on the frequencies and the amplitudes of the oscillations. The results obtained are based on asymptotic methods of the theory of nonlinear oscillations. (10 refs.)

113348 Rayleigh wave excitation by pulses of penetrating radiation at the free surface of a homogeneous and isotropic solid half-space. L.M.Lyamshev, B.I.Chelnokov.

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.585-6 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1361-5 (Nov. 1982). [received: Sept. 1983]

The absorption of various types of penetrating radiation (laser pulses or particle beams from accelerators, for example) in a solid gives rise to acoustic waves. At moderate levels of the energy deposited in the medium, a thermal mechanism plays a dominant role: the sound waves are excited by the thermal expansion of the solid. In addition to the longitudinal and transverse sound waves in a solid, a Rayleigh wave is excited at the free boundary of the solid. It decays more slowly with distance than do waves in the volume. 46.30N Fracture mechanics, fatigue, and cracks

113349 Volume, surface and interface fracture statistics of brittle materials under flexure. P.Kittel (Inst. de Investigaciones y Ensayos de Materiales, Univ. de Chile, Santiago, Chile).

Res Mech. (GB), vol.9, no.2, p.73-86 (1983).

Fracture of brittle materials under flexure with isolated volume, surface and interface flaws is analyzed in order to obtain the specific Weibull risk function for any of these defects. A special composite, corresponding to a reinforced concrete beam, is theoretically studied in order to predict the local and cumulative fracture probability. (6 refs.)

113350 Green's function solution and applications for cracks emanating from a circular hole in an infinite sheet. V.Shivakumar (Lockheed-EMSCO, Houston, TX, USA), R.G.Forman, R.Rosenclanz, Jr..

Res Mech. (GB), vol.9, no.2, p.87-104 (1983).

Stress-intensity factors are obtained for point loaded equal length cracks emanating from a circular hole in an infinite plate. A series approach and the Muskhelishvili formulation in the two-dimensional theory of elasticity are used to derive the solution. The applicability of the solution is demonstrated by using it as a Green's function to obtain stress-intensity factors in the case of (1) biaxial tension and pure shear of an infinite plate and (2) tension and pin loading of a plate with cracks emanating from one hole in a row of holes. (16 refs.)

113351 Determination of stress-intensity factors for cracks in tubes under torsion. L.S.Srinath, N.Srinivasa Murthy, T.V.Hareesh (Dept. of Mech. Engng., Indian Inst. of Sci., Bangalore, India).

Exp. Mech. (USA), vol.23, no.3, p.262-7 (Sept. 1983).

An experimental investigation by two-dimensional photoelastic technique is carried out to study the stress distribution and to determine the stress-intensity factors for arbitrarily oriented cracks in thin cylindrical shells subjected to torsion. A new method is employed to evaluate the pure and mixed-mode SIFs. (7 refs.)

113352 Influence of late-breaking ligaments on crack propagation in compact specimens—a photoelastic study. A.Shukla (Dept. of Mech. Engng. & Appl. Mech., Univ. of Rhode Island, Kingston, RI, USA), J.W.Dally.

Exp. Mech. (USA), vol.23, no.3, p.298-303 (Sept. 1983).

Dynamic photoelasticity and high-speed photography were utilized to study the influence of tough ligaments on crack propagation in compact specimens.

The data obtained during the fracture experiments were analyzed to obtain crack velocity, instantaneous stress-intensity factor and the energy losses away from the crack tip. The results showed that the ligaments can behave as crack arrestors or decelerators. The crack if not arrested at the ligament slowly tunnels in between the ligaments without immediately rupturing them. The ligaments also tend to increase damping losses in the specimens. (8 refs.)

113353 A finite element analysis of a crack growing under cyclic loading. S.Wastberg (Dept. of Strength of Materials & Solid Mech., Royal Inst. of Technol., Stockholm, Sweden).

Fatigue Eng. Mater. & Struct. (GB), vol.6, no.2, p.149-58 (1983).

Crack growth under cyclic loading has been studied by the finite element method. The calculation was made for plane stress conditions. The crack tip zone was modelled as a cohesive zone. The displacement of the free crack surface during unloading was found to be governed by the surrounding continuum and was independent of the details in the fracture zone. This means that crack closure upon unloading is directly related to the ultimate separation, of the cohesive zone, which in turn controls the residual plastic deformation left in the wake of the growing crack. If the distance over which closure takes place is rather small, closure may be very difficult to detect by the compliance technique. (23 refs.)

113354 A crack-tip-zone interaction model for creep-fatigue crack growth. C.E.Jaske (Phys. Metall. Section, Battelle Columbus Labs., Columbus, OH, USA).

Fatigue Eng. Mater. & Struct. (GB), vol.6, no.2, p.159-66 (1983).

A crack-tip-zone interaction model for creep-fatigue crack growth is proposed. The basic details of the model are described. Experimental evidence in support of this model is presented. Existing data on creep-fatigue crack growth interaction agree qualitatively with the model. Some quantitative evidence for the model is presented. (10 refs.)

113355 Geometrically non-linear eccentrically compressed columns of uniform creep strength vs optimal columns. W.Swisterski, A.Wroblewski, M.Zyczkowski (Inst. of Mech. & Machine Design, Tech. Univ. of Cracow, Cracow, Poland).

Int. J. Non-Linear Mech. (GB), vol.18, no.4, p.287-96 (1983).

Optimality of geometrically non-linear eccentrically compressed columns of uniform strength in creep conditions is investigated. A third-order theory with stretchability of axis taken into account is employed. Norton's non-linear creep law and Kachanov's hypothesis (1958) of brittle creep rupture is used and an I -column of uniform strength for a given life-time is numerically evaluated. Then this column is found to be non-optimal and a further parametrical optimization is performed under the constraint of constant volume of the column. The life-time of the optimal column is considerably increased. (26 refs.)

113356 The elastostatic axisymmetric problem of a sphere containing a penny-shaped crack in a nonequatorial plane. R.Kant (Magnetic Recording Inst., IBM Corp., San Jose, CA, USA).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1321-6 (1983).

The axisymmetric problem of a sphere containing a penny-shaped crack in a nonequatorial plane is solved with the use of Boussinesq stress functions. Two coordinate systems—oblate spheroidal for representing the crack surface and spherical polars for the spherical surface, translated along the z -axis with respect to each other—are used to satisfy boundary conditions. Integral representations and transformations of harmonic functions are used to relate stress functions in the two coordinate systems. This procedure leads to a system of algebraic equations which is solved, for axisymmetric tractions on both the surfaces. Graphical results are presented for a specific loading case. (4 refs.)

113357 A path-independent integral for 2-dimensional cracks in homogeneous isotropic conductive plate. M.Saka, H.Abe (Dept. of Mech. Engng., Tohoku Univ., Sendai, Japan).

Int. J. Eng. Sci. (GB), vol.21, no.12, p.1451-7 (1983).

A path-independent integral which is denoted by J_e is introduced for the 2-dimensional crack problems in the homogeneous isotropic conductor in which the steady current flows. By utilizing the J_e -integral the distributions of the electric potential, current density and the Joule heating rate near the crack tip are derived. It is shown that the J_e -integral provides a parameter which dominates the distributions of the electric potential and current density near the crack tip as the square of the amplitude. (9 refs.)

113358 Longitudinal shear of an anisotropic body with a sharp-ended anisotropic inclusion. L.T.Berezhnitskii, I.T.Denisyuk (G.V. Karpenko Physicochem. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.508-14 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.58-66 (Nov.-Dec. 1982).

Considers an anisotropic body containing a sealed-in anisotropic elastic foreign inclusion and subjected to antiplane deformation. The contour of the defect has cusps and the dimensions of the inclusion are small in comparison with the external dimensions of the cylindrical body. It is assumed that such a composite has at each point a plane of elastic symmetry normal to the generatrix of the cylinder. (7 refs.)

113359 Fracture criteria under creep conditions. R.A.Arutyunyan.

Strength Mater. (USA), vol.14, no.9, p.1205-9 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.42-5 (Sept. 1982).

The author uses well known empirical data to concretise the functions and parameters which enter into the proposed fracture criterion. It is shown that this criterion effectively describes experimental fracture curves, embracing both the ductile and brittle fracture sections. The case of a cylindrical rod subjected to tension is used to develop the criterion. (18 refs.)

113360 Calculation of the static crack propagation trajectory. M.P.Savruk, P.N.Osiv (Physicochem. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.11, p.1443-7 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.19-23 (Nov. 1982). [received: Sept. 1983]

The problems linked with the determination of trajectories of quasistatic crack growth in brittle plates are solved by a method of singular integral equations, which is extensively used in determining the stress-strain crack-bearing bodies. (13 refs.)

113361 Fracture toughness of high-strength layered plates containing plastic interlayers with a high elastic modulus. E.N.Rudnitskii, P.G.Miklyayev, D.A.Andreev.

Strength Mater. (USA), vol.14, no.11, p.1448-50 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.23-5 (Nov. 1982). [received: Sept. 1983]

General postulates of linear fracture mechanics are used to examine the laws governing the increase in fracture toughness under plane-stress conditions during the propagation of a through crack in relation to the content of the high-modulus plastic component. This component is introduced in the form of a single intermediate layer located in the center of the cross section of the composite. The increase in fracture toughness realized by increasing the elas-

tic modulus of the interlayer was found to be quite insubstantial. The major increases in fracture toughness were realized as a result of the high fracture toughness of the material of the plastic interlayer during its joint work with other layers in the composite. (4 refs.)

113362 Contour J-integral in the plastic region. Yu.G.Matvienko, V.Yu.Gol'tsev (Moscow Engng. Phys. Inst., Moscow, USSR). *Strength Mater. (USA)*, vol.14, no.11, p.1451-5 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.25-9 (Nov. 1982). [received: Sept. 1983]

The method of dividing grids was used to study the contour invariance of the J-integral and the possibility of using it as a fracture-resistance characteristic in the case of developed plastic flow at a crack tip under plane-stress conditions. Flat specimens 300×700 mm with a central notch, made of aluminum alloy AMtsM and stainless steel 1Kh18N9T, were tested in tension. It is concluded that the contour J-integral is roughly invariant in the small region of plastic strain at the crack tip outside the strain localization zone and that the integration contour affects the value of J with increasing distance of the contour from this zone. To apply the results obtained on specimens to the condition of general plastic yielding in structural elements, it is best to take as the J-integral mean values of same calculated over contours which pass along the boundaries of the localized zone. (14 refs.)

113363 Plastic bands at the tip of a linear rigid inclusion. L.T.Berezhnitskii, N.M.Kundrat (Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.11, p.1502-5 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.66-9 (Nov. 1982). [received: Sept. 1983]

Examines an infinite isotropic body under conditions of plane strain in the system of polar coordinates r, θ , and containing a semi-infinite rigid laminar inclusion which is considered infinitesimally thin. The material of the body (matrix) is ideally elastoplastic and satisfies the Tresca-St. Venant yield condition. It assumed that the plastic deformations are concentrated along narrow straight slip bands emerging from the end of the inclusion. These bands are simulated by transverse shear cracks. The external load is assumed to be symmetrical about the line along which the inclusion extends. It is taken that there are two slip bands; arranged symmetrically about the plane of the inclusion and make with its prolongation the angle α . (9 refs.)

113364 Examination of the stress state of a helically reinforced composite in shearing. G.E.Freger (Voroshilovgrad Engng. Inst., Voroshilovgrad, USSR).

Strength Mater. (USA), vol.14, no.11, p.1564-8 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.116-19 (Nov. 1982). [received: Sept. 1983]

Attention is given to the stress state of a helically reinforced composite with an auxiliary layer consisting of two sections with different physicomechanical properties. The model of a unidirectional reinforced material with a small amount of filling subjected to transverse shearing is examined. It is assumed that the cross section of the main reinforcement is circular, the properties of the main reinforcement in the examined section are isotropic in the transverse direction, and the main reinforcement is encircled by the auxiliary layer consisting of two parts whose material is assumed to be homogeneous and isotropic. When a shear load is applied to the matrix, a plane strain state will form in the system. The problem is solved using Kolosol-Muskhelishvili complex potentials. (5 refs.)

113365 Continuum theory of fracture in the compression of composite materials with a metallic matrix. A.N.Guz' (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.18, no.12, p.1045-53 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.3-11 (Dec. 1982). [received: Sept. 1983]

Examines within the framework of the continuum theory of fracture, the following questions relating to the compression of composite materials with a metallic matrix: formulation of the basic relations with a more rigorous evaluation of the corrected transverse-shear modulus, corresponding to the two-sided estimate of Hashin-Shtrikman; determination of theoretical values of the limiting contraction (fracture strain) and ultimate strength with allowance for the elastic-plastic stage of deformation of the filler and binder, with the derivation of approximate expressions for these quantities with allowance for the zeroth and first approximations; analysis of numerical results obtained with allowance for the zeroth and first approximations and their comparison with experimental results. (8 refs.)

113366 Problem of a crack in an orthotropic strip. B.Rogovskii (Polytech. Inst., Lodz, Poland).

Sov. Appl. Mech. (USA), vol.18, no.12, p.1101-8 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.64-71 (Dec. 1982). [received: Sept. 1983]

Solves the problem of a crack in an orthotropic strip with elastically supported edges. The results are used to analyze the effect of reinforcement anisotropy and boundary conditions on characteristic physical quantities for two types of composite materials. (7 refs.)

113367 Energy criteria for the brittle fracture of composite materials with initial stresses. A.N.Guz' (Mech. Inst., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.19, no.1, p.1-6 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.3-9 (Jan. 1983). [received: Sept. 1983]

Considers the case in which the minimum dimensions of the crack are substantially larger than the dimensions of the structural elements of the composite materials, not investigating fracture processes in which the properties of the piecewise-homogeneous-medium model appear (for example, fracture at the interface between two media, etc.). For the indicated assumptions, the composite material can be simulated (for problems in the mechanics of brittle fracture) by an orthotropic linearly elastic body with reduced constants; for numerical investigations one can take account of one of the main features of composite materials: their low shear rigidity. The investigation is carried out in Cartesian coordinates of the initial deformed state; a variant of a previous theory, when the initial state is determined by the geometrically linear theory and the initial deformations are small, is used. (25 refs.)

113368 Partially contacting crack in a plate with an elliptic hole. M.G.Krivtsov (Inst. for Appl. Problems of Mech. & Math., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.19, no.1, p.48-55 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.59-66 (Jan. 1983). [received: Sept. 1983]

A method for solving stationary problems of thermoelasticity for a plane with curvilinear holes and cracks, under the assumption that the edges of the crack are not in contact in the process of the deformation, is well known. However, when solving problems in this formation, it is possible that the discontinuity of the normal displacements has a negative value on certain parts of the crack. Consequently, on these parts it is possible to have contact between the edges of the crack, whose presence may affect essentially the magnitude of the intensity of the stresses in the noncontacting vertices of the crack. On the

example of the plane with an elliptic hole, the author shows the method of solving thermoelasticity problems, considering a smooth contact of the edges of a rectilinear crack. (5 refs.)

113369 The state of stress and strain at the point of accumulation of collinear cracks. S.A.Nazarov.

Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR), no.3, p.63-8 (July 1983). In Russian.

The state of stress and strain caused by an infinite system of cracks on a beam which accumulate towards one point is investigated. On a logarithmic scale the cracks are supposed to be arranged periodically. (10 refs.)

113370 Shear crack extension through an incident influence. Lim Chee-seng (Nat. Univ. of Singapore, Singapore).

Z. Angew. Math. & Mech. (Germany), vol.63, no.8, p.349-58 (1983).

SH motion is triggered by the nonuniform extension of a crack under an applied, general body force. The net incident force-field along the fault plane converts into an incident influence which plays an important role in the source mechanism. With subsonic extension, fault plane perturbations ahead of a foremost crack-emitted wavefront, naturally originate entirely at the applied force. Nonetheless, they contribute to the incident influence everywhere behind such a wavefront. For a trailing mode of reception preceding the crack, repeated inversion of a governing inhomogeneous integral equation yields a displacement gradient that behaves singularly near the advancing crack edge. On invoking a Barenblatt type criterion, this singularity gets eliminated, essentially, because of the incident influence. A nonlinear integral equation governing that particular crack edge results. Another nonlinear integral equation can be formulated for an arrested advance. Besides the desingularized displacement gradient derived outside the crack, the displacement difference across the crack faces is also determined. A vital question throughout concerns the availability of bounded quantities. (31 refs.)

113371 Finite element model simulation of creep crack growth in low-ductility material. A.Nitta, K.Kuwabara, T.Kitamura.

Report E281005, Central Res. Inst. Electr. Power Ind., Tokyo, Japan (Jan. 1982), 48 pp.

The finite element method was applied to the simulation of creep crack growth (CCG) in a center cracked plate, and single and double edge cracked specimens for the purpose of discussion on a fracture mechanics parameter controlling the rate of CCG under small scale yielding (where a creep zone ahead of a crack tip is much smaller than the surrounding elastic region) and extensive creep conditions. As a result, it was recognized that the small scale yielding condition in creep was satisfied in case of fracture strain of the order of 0.001. The correlation of CCG rate with the elastic stress intensity factor, K, was found to depend on the specimen geometry, although K could be a good parameter individually for each specimen geometry under the small scale yielding condition. On the other hand it was found that the so-called C* parameter based on the concept of nonlinear fracture mechanics was a CCG controlling parameter for the small scale yielding condition as well as under the extensive creep condition. (56 refs.)

113372 Definition of interphase in composites. P.S.Theocaris (Dept. of Mech., Nat. Tech. Univ., Athens, Greece).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.481-502. The role of the boundary interphase on the determination of crack propagation, as well as the thermomechanical behaviour of composite materials, was investigated. Theoretical models taking into account the presence of a third phase, surrounding each one of the inclusions are presented, and the influence of a large number of parameters on the modes of fracture of composite materials was studied. It is shown that the method of caustics is an experimental method suitable in determining the crack-propagation behavior of composites. (19 refs.)

46.30P Friction, wear, adherence, hardness, mechanical contacts

113373 Analysis of contact problems with friction under oscillating loads. E.B.Pires (Techn. Univ. of Lisbon, Lisbon, Portugal), J.T.Oden.

Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.39, no.3, p.337-62 (Sept. 1983).

The numerical analysis of a class of contact problems with friction is considered. The problems considered involve the contact of linearly elastic bodies on material surfaces on which nonclassical friction laws are assumed to hold.

The problems are two-dimensional (plane stress, plane strain, or axisymmetric deformations of bodies of revolution) and finite element methods are developed to study these problems. Two general types of problems are studied. First, the equilibrium problem of the contact of a linearly elastic body with a foundation is considered. The foundation can be rigid (i.e. the Signorini problem) or of a Winkler-type characterized by a distributed system of linear springs, and dry static friction forces are assumed to be developed on the contact surface. Second, a class of quasi-static contact problems is considered in which particular attention is given to modelling the evolution of stresses and deformations on the contact surface for various load histories, including slowly oscillating loads applied tangent to the contact surface. (18 refs.)

113374 The photoelastic-coating technique for plastic-elastic contact. H.Fessler (Dept. of Mech. Engng., Univ. of Nottingham, University Park, Nottingham, England), M.Eissa.

Exp. Mech. (USA), vol.23, no.3, p.282-8 (Sept. 1983).

Steel models coated with thin birefringent layers representing transverse sections through British-Standard-inch keyed shafts and hubs have been loaded in torsion. Models with two different steel shafts and clearance fits between key and keyways and between shaft and hub have been analyzed over a large range of torques. Large plastic strains occurred at six contact positions where there are discontinuities of profile and surface contact of the chamfered key or the shaft. Contact strains have been measured, corrected for shear lag and normalized. Plastic-elastic SCFs are lower than corresponding elastic values. (7 refs.)

113375 Observation of damage growth in compressively loaded laminates. H.Chai, W.G.Knauss, C.D.Babcock (California Inst. of Technol., Pasadena, CA, USA).

Exp. Mech. (USA), vol.23, no.3, p.329-37 (Sept. 1983).

An experimental program to determine the phenomenological aspects of composite-panel failure under simultaneous compressive in-plane loading and low-velocity transverse impact [0.75 m/s (0.250 ft/s)] is described. High-speed photography coupled with the shadow-moire technique is used to record the phenomenon of failure propagation. The information gained from these records, supplemented by plate sectioning and observation for interior damage, has provided information regarding the failure-propagation mechanism. The results show that the failure process can be divided roughly into two phases. In the first phase the plate is inspected, and the resulting response causes interlaminar separation. In the second phase the local damage spreads to the undamaged portion of the plate through a combination of laminae buckling and further delamination. (10 refs.)

113376 The interaction between a system of circular punches on a nonhomogeneous elastic half space. V.I.Fabrikant (Dept. of Mech. Engng., Concordia Univ., Montreal, Quebec, Canada), L.M.Keer.

Int. J. Mech. Sci. (GB), vol.25, no.7, p.513-18 (1983).

The present analysis considers an integral equation formulation for the problem of the indentation of a nonhomogeneous elastic half space by an arbitrary number of punches. The elastic half space is represented by a material whose deformation modulus varies with the depth according to a power law. An analytical solution is obtained subject to the approximation that the separation of the punches is large when compared with dimensions of the punches. (8 refs.)

113377 Torsional impact of a layer or a cylinder bonded to an elastic half-space. R.S.Dhaliwal, B.M.Singh, J.Vrbik (Dept. of Math. & Statistics, Univ. of Calgary, Alberta, Canada).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1397-408 (1983).

Considers two torsional impact problems. The first problem deals with the solution of a layer bonded to an elastic half-space when the layer is driven by the torsional impact over a bonded rigid circular disc. In the second problem sudden torsion by a rigid disc attached over the plane face of a circular cylinder is considered and the rest of the plane surface of the cylinder is stress free. The cylinder is bonded to the half-space, making use of Laplace and Hankel transforms the solution of each problem is reduced into Fredholm integral equations of the second kind. A numerical Laplace inversion technique is then used to recover the time dependence of the solution. The numerical values for the applied torque at the surface of the rigid disc are calculated for each problem and then are displayed graphically. (10 refs.)

113378 Movement of spheres on rotating discs—a new method to measure coefficients of rolling friction by the central drift. K.Weltner (Inst. für Didaktik der Phys., Univ. Frankfurt/Main, Frankfurt am Main, Germany).

Mech. Res. Commun. (GB), vol.10, no.4, p.223-32 (July-Aug. 1983).

A sphere freely rolling without slipping on a rotating platform moves on stable circular orbits with regard to the laboratory system. The center of the sphere may even rest at a given place while the sphere spins around. If a force parallel to the plane of the rotating disc acts on the sphere a drift movement results perpendicular to the force. In the case of rolling resistance a drift of the sphere to the center of rotation can be observed. This effect is used to measure coefficients of rolling friction. Furthermore with rotating cones and funnels there exist stable modes of movement on orbits around the cone or funnel. (5 refs.)

46.30R Measurement methods and techniques

(see also 07.10 Mechanical instruments and techniques, 81.70 Materials testing)

113379 Prevention of 'mottle' in an epoxy resin as a photoelasticity material. Feng Zhensheng (Inst. of Engng. Mech., Acad. Sinica, Peking, China).

Acta Mech. Sin. (China), no.3, p.278-85 (1983). In Chinese.

The cause of 'mottle' in an epoxy resin material for photoelasticity is investigated. Several effective methods are presented to avoiding it. These methods amount eventually to the introduction of complex groups in the molecular-chain to break its systematic nature, an increase in internal friction and the prevention of the occurrence of microliths or conglomerate microliths in the casting caused by molecular-chain disposal due to stress. (18 refs.)

113380 A new method for the direct measurement of EOS—the improvement of an EMV gauge. Liang Yunmin (Peking Inst. of Technol., Peking, China).

Acta Mech. Sin. (China), no.3, p.298-300 (1983). In Chinese.

The author has developed an in-situ electro-magnetic velocity gauge system for measuring both the velocity of a shock wave and the velocity of particles at the same place insulate material, directly. Two normal velocity gauges were welded in series, each sensitive arm was inserted in a different plane perpendicular to the direction of shock wave. It simplified the method for measuring the shock relations. Data was obtained from a PMMA plate. (3 refs.)

113381 An edge-cracked mode II fracture specimen. L.Banks-Sills, M.Arcan (Dept. of Solid Mech., Materials & Structures, Tel-Aviv Univ., Ramat-Aviv, Israel).

Exp. Mech. (USA), vol.23, no.3, p.257-61 (Sept. 1983).

A proposed edge-cracked Mode II fracture specimen is analyzed using an extended photoelastic-numerical procedure. It is shown that the Mode II stress-intensity factor is significantly higher for the longest edge-crack considered and the Mode I deformation is negligible, demonstrating the merits of this specimen for Mode II fracture-toughness testing. (12 refs.)

113382 Another method to separate principal strains in photoelastic coatings. P.J.Sevenhuijsen (Nat. Aerospace Lab., Amsterdam, Netherlands).

Exp. Mech. (USA), vol.23, no.3, p.268-9 (Sept. 1983).

It is shown that the combination of a prism and a reflection polariscope provided with a Babinet-Soleil compensator offers a simple practical solution to the problem of separation of the principal strains in photoelastic coatings. (2 refs.)

113383 Half-fringe photoelasticity: a new approach to whole-field stress analysis. A.S.Voloshin, C.P.Burger (Dept. of Engng. Sci. & Mech., Iowa State Univ., Ames, IA, USA).

Exp. Mech. (USA), vol.23, no.3, p.304-13 (Sept. 1983).

Presents a new method for whole-field stress analysis based on a symbiosis of two techniques—classical photoelasticity and modern digital image analysis. The resulting method is called 'half-fringe photoelasticity (HFP)'. Classical photoelasticity demands materials with high birefringence which leads to extensive use of plastics as model materials. Since the behavior of these materials is often different from that of the prototype materials, their use distorts the similitude relationships. In many contemporary problems this distortion is untenable. HFP offers a way of this dilemma. It permits materials and loads to be chosen so that no more than one half of a fringe order appears in the area of interest. Thus, for example, glass, which behaves linearly up to high stress levels and over a wide range of temperatures, could be used as model material. Alternatively, models from polymeric materials could be used under very low load in order to stay within the linear part of the stress strain diagram and to prevent large deformations. The half-fringe-photoelasticity system, which is described here, utilizes the resulting low levels of birefringence for effective stress analysis. (8 refs.)

113384 Nonlinear photoviscoelasticity: theory and measurement. A.Tougui (Univ. Cadi-Ayyad, Marrakech, Morocco), D.Gamby, A.Lagarde, H.F.Brinson.

Exp. Mech. (USA), vol.23, no.3, p.314-21 (Sept. 1983).

Photoviscoelasticity and photoplasticity concepts are reviewed and differences and similarities are discussed. The suggestion is made that a better understanding of nonlinear-time-varying birefringence enhances the utilization of polymeric materials for photoplasticity studies. A mathematical model for nonlinear photoviscoelasticity is presented. Measurements of optical creep and creep recovery are given and comparisons between theory and experiments are made and discussed. (29 refs.)

113385 A noncontacting system for measuring effective stress-strain curves of ultra-thin X-ray-mask materials. T.D.Dudderar, L.R.Thibault (Bell Labs., Murray Hill, NJ, USA).

Exp. Mech. (USA), vol.23, no.3, p.322-8 (Sept. 1983).

A noncontacting test system has been developed for making measurements of the deformation characteristics of the ultra-thin (~10 μm) membrane structures of X-ray masks using a pneumatic bulge test. These measurements, which include the bulge height and radius-of-curvature at the pole, are then analyzed to provide composite estimates of the effective stress and effective strain of the mask membrane materials. (5 refs.)

113386 A technique for cyclic-plastic notch-strain measurements. M.W.Guillot (Engng. Dept., Ethyl Corp., Baton Rouge, LA, USA), W.N.Sharpe, Jr.

Exp. Mech. (USA), vol.23, no.3, p.354-60 (Sept. 1983).

The interferometric strain/displacement gage was used to measure local strains of approximately ± 1 percent strain near a central notch in specimens undergoing completely reversed loading. Two notch geometries were tested: a circular hole and a keyhole slot with theoretical stress-concentration factors of 3.1 and 5.9 respectively. Measurements were made at both room and elevated temperatures (149° and 260°C) on three materials having different cyclic properties. The authors describe the experimental techniques for making the notch-strain measurements. The results of this series of tests are used in evaluating Neuber's cyclic rule. (15 refs.)

113387 Effect of side-grooves on fatigue crack retardation. J.P.Hess, A.F.Grandt, Jr., A.Dumanis (School of Aeronaut., Purdue Univ., West Lafayette, IN, USA).

Fatigue Eng. Mater. & Struct. (GB), vol.6, no.2, p.189-99 (1983).

Describes results of an experimental program conducted to determine the influence of deep side-grooves on fatigue crack retardation. The results indicate that side-grooves significantly reduce the delay in fatigue crack growth caused by single peak overloads. It is suggested that the decreased retardation is due to simulation of plane strain conditions in the 'thin' test sections by the stress field at the root of the side-groove. (24 refs.)

113388 Influence of thickness and temperature on stretched zone size in J_{IC} tests. C.M.Gilmore (Dept. of Civil, Mech. & Environmental Engng., George Washington Univ., Washington, DC, USA), V.Provenzano, F.A.Smidt, Jr., J.R.Hawthorne.

Met. Sci. (GB), vol.17, no.4, p.177-85 (April 1983). [received: Sept. 1983]

The nature of the microscopic processes occurring at the crack tip during crack initiation and the early stages of propagation were investigated by detailed characterisation of the stretched zone in J integral specimens of two thicknesses tested at two different temperatures. The J integral tests were conducted on HT-9, a martensitic stainless steel, using the single specimen compliance method. The topography of the crack tip region was mapped by detailed stereographic measurements on scanning electron micrographs of the region containing the stretched zone. The measured J_{IC} values and the stretched zone dimensions for each test condition were then compared using the relationship of Knott: $J_{IC} = m\sigma_0\delta_c$, where m is a constraint factor, σ_0 is the flow stress, and δ_c is the crack opening displacement taken as twice the stretched zone height. Theory predicts values of m of about 2 for specimens

under plane strain conditions and lower values of m for thin specimens under plane stress conditions. The current experiments showed good agreement with theory for the thicker specimens but larger values of m , near 6.0, for the thin specimens. A rationale for this lack of agreement and an analysis of the crack tip deformation processes are presented. (17 refs.)

113389 Device for measuring the loss factor of insulating materials. D.Schmitz. *Plaste & Kautsch. (Germany)*, vol.30, no.7, p.408-12 (July 1983). In German. The electromagnetically induced vibrations of metal strips of 1 mm thickness were examined when they had been coated with an insulating lacquer. The strips were clamped at one end. They had been cut from sheet along the direction of rolling. Care was taken to grind the edges of the strips and to make them of uniform width. The loss factor was determined by the resonance method. (10 refs.) R.S.

113390 Design of an experiment to determine deformations using holographic interferometry. V.S.Pisarev, V.V.Yakovlev, V.O.Indisov, V.P.Shechepinov (Engng.-Phys. Inst., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.179-84 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.292-300 (Feb. 1983). [received: Sept. 1983]

The design of an experiment is considered in which holographic interferometry is used to determine displacements produced by deformation. The technique uses the C -optimality criterion and is suitable for all types of holographic interference patterns whose analysis involves solving a system of linear algebraic equations. It is shown that C -optimal designs can be obtained by estimating the magnitude of the error vector for the solution of the system of equations for the scaled sensitivity matrix if the absolute fringe orders are known. The practical use of optimally designed interferometers is illustrated by calculating the surface deformation of a cylindrical shell containing a round hole when the shell is loaded by an internal pressure. (31 refs.)

113391 Thermoelectric method for studying stresses in plates weakened by holes. V.Ya.Bash (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.11, p.1506-8 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.69-72 (Nov. 1982). [received: Sept. 1983]

Results are presented of using a thermoelectric method, which is based on the mechanism of change in solid body temperature during its active deformation, for studying stresses in the area of an active concentrator in the form of a hole in thin plates. The results obtained are compared with elasticity theory data. (6 refs.)

46.60 RHEOLOGY OF FLUIDS AND PASTES

113392 Relation between the deformation of macromolecules and a polymer melt under uniaxial tension. V.E.Dreval, G.V.Vinogradov. *Vysokomol. Soedin. Ser. B (USSR)*, vol.25, no.6, p.448-50 (1983). In Russian.

The opinion expressed by the present authors and others in 1981 (G.V. Vinogradov et al., *Vysokomol. Soedin.*, vol.21, no.12, p.2627), according to which the maximum values of the high elastic deformation of polymer melts should approach the value of the deformation for the most straightened macromolecules is substantiated by a consideration of additional data. It is noted that the strength of materials obtained from amorphous or weakly crystalline polymers under conditions where $(l_e/l_0) = (l_e/l_0)_{max}$, where l is the final length of a specimen at the moment of rupture and l_0 is the length of the specimen rupture and deformational relaxation is much lower than that of materials from oriented easily crystallizing polymers. (9 refs.) N.S.

113393 Anomalous rheological behaviour of poly(vinyl alcohol) gels. M.Watake (Chem. Res. Lab., Faculty of Liberal Arts, Shizuoka Univ., Shizuoka, Japan), K.Nishinari. *Polym. Commun. (GB)*, vol.24, no.9, p.270-3 (Sept. 1983).

The rheological properties of poly(vinyl alcohol) gels, which were evacuated in a frozen state and then immersed in distilled water, have been investigated as a function of temperature, concentration and evacuation time. Dynamic Young's modules E' increased with an increase in concentration and evacuation time. The modulus increased up to a certain temperature and then began to decrease with any further increase in temperature. These behavioural characteristics were compared with those of agar-agar gels. (22 refs.)

113394 Oscillations generated in the compression of a viscoelastic body. G.I.Burde, T.M.Burde.

J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.841-9 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.114-23 (Nov.-Dec. 1982). [received: Sept. 1983]

It is shown that in deformations of compressible viscoelastic bodies another type of instability is possible, namely oscillations induced by the bulk elasticity of the material and driven up in hydrostatic compression of the sample as a result of inertial interaction of the disturbances with the main flow. The conditions for growth of the oscillations are determined from the linearized small-perturbation equations; on the basis of a nonlinear analysis, the nature of the excitation is investigated, and the amplitude of the oscillations is determined. Calculations are carried out for the case of uniform planar deformation and ideally smooth and rigid bounding surfaces. (9 refs.)

113395 Nonlinear viscoelasticity and the Cox-Merz relations for polymeric fluids. H.C.Booij, P.Lebians, J.Palmen, G.Tiemersma-Thoone (DSM, Central Res., Geleen, Netherlands).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1703-11 (Sept. 1983). An investigation is made of the important class of fluids whose rheological properties are described by a quasilinear viscoelastic constitutive equation of the Boltzmann superposition type. The first Cox-Merz relation is closely approximated by such a fluid if its nonlinearity in shear can be described by the strain measure $S_{12}(\gamma) = \int_0^\gamma J_0(v)dv$, irrespective of the distribution of its relaxation times and, hence, its linear viscoelastic properties. Here γ equals the shear strain and J_0 the zeroth-order Bessel function. The second Cox-Merz relation is met by materials with a different nonlinearity, namely $S_{12}(\gamma) = Si(\gamma)$, where Si is the sine integral. Experimental data on melts of a polystyrene and a low-density polyethylene sample were utilized to demonstrate that both Cox-Merz relations cannot hold simultaneously. (18 refs.)

113396 Viscoelastic fluid flow exhibiting hysteretic phase changes. J.K.Hunter (Dept. of Maths., Colorado State Univ., Fort Collins, CO, USA), M.Slemrod.

Phys. Fluids (USA), vol.26, no.9, p.2345-51 (Sept. 1983).

In the present paper a mathematical theory is given for a viscoelastic fluid exhibiting a hysteresis loop in the shear stress versus shear rate plane. The main rheological idea is to introduce a constitutive equation of rate type whose steady shear stress versus shear rate locus is nonmonotone. The main mathematical idea is to use a local shock structure theory to pick out the admissible solutions in loading and unloading of the applied driving force. (21 refs.)

113397 Applications of exponential splines in computational fluid dynamics. B.J.McCartin (Pratt & Whitney Aircraft, East Hartford, CT, USA).

AIAA J. (USA), vol.21, no.8, p.1059-65 (Aug. 1983).

Recurrent problems in the use of cubic spline interpolation are investigated. It is shown how to automatically resolve any difficulties that do arise, by the alternative use of exponential spline interpolation. Numerical examples of a general nature are presented first illustrating the inherent superiority of the exponential spline to the cubic spline. Attention is then focused on a variety of problems from computational fluid dynamics. The discussion culminates in the detailed exposition of a typical boundary-layer calculation. (17 refs.)

113398 Pseudospectral approximation in a three-dimensional Navier-Stokes code. K.C.Reddy (Arnold Engng., Dev. Center, Arnold Air Force Station, TN, USA).

AIAA J. (USA), vol.21, no.8, p.1208-10 (Aug. 1983).

Pseudospectral methods have the potential of yielding high accuracy for a given number of spatial nodes or collocation points in solving certain classes of partial-differential equations. Spectral and pseudospectral methods are formally infinite-order accurate, according to Gottlieb and Orszag (1977). For problems with periodic boundary conditions, Fourier spectral methods can be efficiently implemented to obtain highly accurate solutions. The author describes a solution scheme for three-dimensional Navier-Stokes equations using a pseudospectral approximation in one of the spatial directions. He considers the flow over a hemisphere cylinder at an angle of attack. The flow is three dimensional but has a plane of symmetry. (4 refs.)

113399 Estimates near the boundary of solutions in H_{loc}^1 of the Dirichlet problem. M.I.Hassan (Dept. of Math., King Abdulaziz Univ., Jeddah, Saudi Arabia).

Appl. Anal. (GB), vol.16, no.3, p.195-203 (1983).

Solutions in H_{loc}^1 of Dirichlet's problem for a linear second-order elliptic equation are considered. The nature of singularities which higher derivatives of such solutions may have near the boundary is investigated. (3 refs.)

113400 A geometric property of level sets of solutions to semilinear elliptic Dirichlet problems. B.Kawohl (Div. of Appl. Math., Brown Univ., Providence, RI, USA).

Appl. Anal. (GB), vol.16, no.3, p.229-33 (1983).

It is shown that under certain geometrical assumptions on a domain $D \subset \mathbb{R}^n$ any positive solution of $\Delta u + f(u) = 0$ in D , $u = 0$ on ∂D has level sets

$D_c = \{x \in D | u(x) \geq c\}$ with the same geometrical properties as D . This implies that u has only one critical point and extends results of Payne (1973) and Sperb (1975). (13 refs.)

113401 Local regularity, boundary values and maximum principles for pseudoparabolic equations. R.E.Showalter (Div. of Appl. Math., Brown Univ., Providence, RI, USA).

Appl. Anal. (GB), vol.16, no.3, p.235-41 (1983).

The regularity or singularity of data at a point is shown to be preserved for all time at that point along the solution of a pseudoparabolic equation. This significantly strengthens earlier results on the perseverance of global regularity of data and furthermore shows that any local singularities in initial data are stationary. These results yield a precise description of the boundary values of a solution and explain certain non-standard maximum principles for pseudoparabolic equations. (9 refs.)

113402 Eigenvalues of the Orr-Sommerfeld equation in an unbounded domain. M.Miklavic (Dept. of Math. Sci., Rensselaer Polytech. Inst., Troy, NY, USA).

Arch. Ration. Mech. & Anal. (Germany), vol.83, no.3, p.221-8 (1983).

The author proves that in the space $(L^2(0, \infty))^4$ the generalized Orr-Sommerfeld equation has only finitely many eigenvalues when the mean flow exponentially approaches a constant. This surprising fact was discovered by numerical studies of eigenvalues for Blasius mean flow. (12 refs.)

113403 Domain decomposition methods for nonlinear problems in fluid dynamics. R.Glowinski (Univ. Paris VI, Paris, France), Q.V.Dinh, J.Periaux. *Comput. Methods Appl. Mech. & Eng. (Netherlands)*, vol.40, no.1, p.27-109 (Sept. 1983).

The numerical solution of finite element approximations of complicated two- and three-dimensional nonlinear problems can be a most formidable task. In order to overcome this difficulty related to dimensionality, domain-splitting methods can be very effective, particularly in view of obtaining a fast and economical conjugate gradient solver, which can be used to precondition the solution of nonlinear problems by optimization methods via nonlinear least squares or weighted residual formulations. A new technique of this type is introduced and analysed and its efficiency discussed from numerical experiments concerning the numerical simulation of transonic flows for compressible inviscid fluids and incompressible viscous flows modelled by the Navier-Stokes equations. (33 refs.)

113404 A nonexistence result for axially symmetric flows with constant angular velocities at infinity. A.R.Elcrat (Wichita State Univ., Wichita, KS, USA), D.Siegel.

Proc. R. Soc. Edinburgh Sect. A (GB), vol.93, pt.3-4, p.229-31 (1983).

If von Karman's substitution is made in the Navier-Stokes equations, and boundary conditions corresponding to a flow in all of space with constant angular velocities at infinity are imposed, a boundary value problem analogous to those for flow above a rotating disk and between rotating disks is obtained. It is shown here that this problem has no solution. (4 refs.)

Physica D (Netherlands), vol.7D, no.1-3, p.126-34 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

Summarizes some recently obtained results on real and complex Lorenz equations and discusses their possible significance in relation to real fluid dynamical processes. (70 refs.)

113406 Stokes equations approximation: a spectral method for error estimation. Y.Maday, B.Metivet (Onera, Chatillon, France).

Rech. Aerosp. (France), no.4, p.237-44 (July-Aug. 1983). In French.

For solving partial differential equations, the authors propose using Chebyshev polynomial expansions. Such expansions allow them to obtain errors of the same order as in the Fourier series in the periodic case. They also make it possible to use the fast Fourier transform for computing. Functional frame—which makes it possible to estimate the approximation error for different spectral methods—is introduced on a monodimensional problem (Poisson equation) with nonperiodic boundary conditions. The study is then extended to the 2-D current function Stokes equations. (13 refs.)

Sov. Appl. Mech. (USA), vol.18, no.12, p.1118-25 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.83-90 (Dec. 1982). [received: Sept. 1983] (4 refs.)

113408 Streamlining of a sphere when the Mach and Knudsen numbers are small. D.A.Shapiro.

Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR), no.3, p.108-12 (July 1983). In Russian.

The problem of a stationary flow with sliding on the surface of a streamlined sphere is considered. Assuming the Mach and Knudsen numbers to be small and of the same order, an even asymptotic expansion of the solution of a corresponding stationary border problem for a nonlinear Boltzmann equation is built. Navier-Stokes equations with asymptotic precise border conditions are obtained for values which define macroparameters. (2 refs.)

113409 Compressible laminar boundary layers on a yawed infinite cylinder. R.Krishnaswamy, G.Nath (Dept. of Appl. Maths., Indian Inst. of Sci., Bangalore, India).

Indian J. Technol., vol.21, no.2, p.43-8 (Feb. 1983). [received: Sept. 1983]

The solution of the steady compressible laminar boundary-layer equations for a yawed infinite circular cylinder is presented which is valid from the origin of the coordinates to the point of separation. The nonlinear partial differential equations governing the nonsimilar flow have been solved numerically using the implicit finite-difference scheme in combination with the quasilinearization technique. It is found that the injection, hot wall and Mach number cause separation to occur earlier, whereas cold wall and suction delay separation. The yaw angle has very little effect on the location of the point of separation. (34 refs.)

113410 Unsteady attachment line flow on a flat plate with attached cylinder. M.Kumari, G.Nath (Dept. of Appl. Math., Indian Inst. of Sci., Bangalore, India).

Int. J. Eng. Sci. (GB), vol.21, no.12, p.1493-503 (1983).

The unsteady laminar incompressible boundary-layer attachment-line flow on a flat plate with attached cylinder with heat and mass transfer has been studied when the free stream velocity, mass transfer and surface wall temperature vary arbitrarily with time. The governing partial differential equations with three independent variables have been solved numerically using an implicit finite-difference scheme. The heat transfer was found to be strongly dependent on the Prandtl number, variation of wall temperature with time and dissipation parameter (for large times). However, the free stream velocity distribution and mass transfer affect both the heat transfer and skin friction. (12 refs.)

113411 A note on expansions for the two-dimensional, compressible, laminar boundary layer equations near a point of zero skin friction. G.Wilks (Dept. of Math., Univ. of Strathclyde, Glasgow, Scotland).

Proc. R. Soc. Edinburgh Sect. A (GB), vol.94, pt.1-2, p.93-6 (1983).

The first non-arbitrary coefficient, α_2 , of the Buckmaster expansions is evaluated in the context of the extended Goldstein-Stewartson theory. Leading terms of the next order contributions to the skin friction and heat transfer coefficients are also obtained. (4 refs.)

113412 A view of the triple deck. R.E.Meyer (Dept. of Math., Univ. of Wisconsin, Madison, WI, USA).

SIAM J. Appl. Math. (USA), vol.43, no.4, p.639-63 (Aug. 1983).

An introduction to triple-deck theory for steady, two-dimensional boundary layers in low-speed flow is presented. It aims to clarify how the rational structure of the theory can rest on few premises and to make its new ideas and challenges more widely accessible. (19 refs.)

113413 Laminar flow in a meandering channel. M.Van Dyke (Dept. of Mech. Engng., Stanford Univ., Stanford, CA, USA).

SIAM J. Appl. Math. (USA), vol.43, no.4, p.696-702 (Aug. 1983).

Plane laminar flow through a meandering channel of constant width is approximated on the basis that the curvature of the centerline is both small and slowly varying. The fourth approximation is calculated for a general shape of centerline. It is used to discuss whether the flow can separate from the walls of such a channel. An alternative scheme of successive approximations is outlined, based on fitting at each station the flow through a tangent annulus. (13 refs.)

113414 Axial flow past a cylinder with uniform injection. L.J.Crane (School of Math., Trinity Coll., Univ. of Dublin, Dublin, Ireland).

Z. Angew. Math. & Mech. (Germany), vol.63, no.8, p.391-3 (1983).

In view of its practical importance the effect of injection on boundary layers has attracted the attention of many authors. An approximate similarity solution of the boundary layer equations is derived; this solution is valid at sufficiently large axial distances from the nose of the cylinder. The basic properties of the flow depend on m , the Reynolds number of the injection velocity based on the radius a of the cylinder. When m is of order unity a continuous boundary layer is formed between the cylinder and the outer stream; when $m \gg 1$ this boundary layer separates from the wall to form a thin axially symmetric shear layer. 47.15F Stability of laminar flows

113415 Limits of regions of strict hyperbolic and composite type for nonlinear equations of two-layer shallow water. G.G.Elenin.

Moscow Univ. Comput. Math. & Cybern. (USA), no.4, p.69-72 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 15 (USSR)*, no.4, p.57-9 (1982). [received: Sept. 1983]

The properties of the stability limits of strictly hyperbolic and composite type for the system of equations of two-layer shallow water are analytically and numerically investigated. (4 refs.)

47.20 HYDRODYNAMIC STABILITY

113416 Supersonic stabilization of a tangential shear in a thin atmosphere. S.V.Bazdenkov, O.P.Pogutse (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).

JETP Lett. (USA), vol.37, no.7, p.375-7 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.317-19 (5 April 1983). [received: Oct. 1983]

A tangential shear in a thin atmosphere is stable if the amplitude of the velocity jump $V > 2\sqrt{2c_g}$, where c_g is the velocity of surface gravity waves. The Coriolis force and the finite width of the flow region are destabilizing factors. (5 refs.)

113417 Stabilization of tangential shear instability in shallow water with 'supersonic' fluid flow. S.V.Antipov, M.V.Nezlin, V.K.Rodionov, E.N.Snezhkin, A.S.Trubnikov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR). *JETP Lett. (USA)*, vol.37, no.7, p.378-81 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.319-22 (5 April 1983). [received: Oct. 1983]

It is demonstrated experimentally that under conditions of (two-dimensional) 'shallow water' Landau's conclusion (1953) that the instability of the super-sonic tangential shear is stabilized for $u > (2g^*H_0)^{1/2}$, where $2u$ is the relative velocity of countermoving flows, H_0 is the depth of the fluid, and g^* is the effective acceleration of gravity, is correct. The result obtained corresponds to the theory of S.V. Bazdenkov and O.P. Pogutse [*Pis'ma Zh. Eksp. Teor. Fiz.* 37, 317 (1983)]. (5 refs.)

113418 Stability of rotating liquids drops. I. Uncharged drops. P.Luyten, D.K.Callebaut (Phys. Dept., Univ. Instelling Antwerpen, Anwerp, Belgium). *Phys. Fluids (USA)*, vol.26, no.9, p.2359-67 (Sept. 1983).

The oscillations and the instability of a uniformly rotating liquid drop endowed with surface tension are investigated. The linearized equations of motion are solved using 'modified' spheroidal coordinates. A general energy integral technique which is more adequate than the virial method is developed to yield the dispersion relations. The equilibrium figure is first approximated by a spheroid. The dynamical and secular instabilities are calculated in general. In the latter case bifurcation occurs towards nonrotationally symmetric equilibria. Then the exact equilibrium figure is studied by the same energy integral technique. The results are compared with those of the spheroidal approximation and with the numerical calculations of Brown and Scriven (1980). (16 refs.)

113419 Transitions to chaos in the Ginzburg-Landau equation. H.T.Moon, P.Huerre, L.G.Redekopp (Dept. of Aerospace Engng., Univ. of Southern California, Los Angeles, CA, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.135-50 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

The amplitude evolution of instability waves in many dissipative systems is described close to criticality, by the Ginzburg-Landau partial differential equation. A numerical study of the long-time behavior of amplitude-modulated waves governed by this equation allows the identification of two distinct routes of the Ruelle-Takens-Newhouse type (1978) as the modulation wavenumber is decreased. The first route involves a sequence of bifurcations from a limit cycle to a two-torus to a three-torus and to a turbulent regime, the last stage being preceded by frequency locking. The turbulent regime is itself followed by a new two-torus. In the second route, this two-torus exhibits a single subharmonic bifurcation which immediately results in transition to chaos. A description of the various possible dynamical states is tentatively given in the plane of the two control parameters c_4 and c_6 . (43 refs.)

113420 Behavior of a local cluster of gas bubbles in a vibrating fluid. V.D.Lakiza, A.S.Tsypenko (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.19, no.1, p.92-6 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.109-14 (Jan. 1983). [received: Sept. 1983]

The dynamical behavior and questions of the vibrational stability of a local gas bubble cluster in a vibrating fluid are treated theoretically and experimentally. The cluster interaction with the solid vessel surface is taken into account. (6 refs.)

47.25 TURBULENT FLOWS, CONVECTION, AND HEAT TRANSFER

113421 Mixing and diffusion of heated water discharge for power plants. R.R.Hwang, Shian-Woei Jeng, B.S.Shiau (Inst. of Phys., Acad. Sinica, Taipei, Taiwan).

Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan), vol.12, p.250 (Dec. 1982). [received: Sept. 1983]

The study treats a buoyant surface discharge into a large body of water and integrates the near-field and the far-field analysis in predictions of water temperatures resulting from the surface discharge of heated water in ambient flow configurations. The main objectives are to develop a framework for integrating the near-field and the far-field models. The near-field model includes buoyant jet interaction with a shallow bottom while the far-field model is capable of predicting temperatures in a large body of water which is subject to a range of transient current conditions. Therefore, the authors investigate the basic behavior of buoyant surface discharge and attempt to improve their ability to predict water temperatures resulting from these discharges. (no refs.)

113422 The turbulence problem: a survey. R.Narasimha (Dept. of Aerospace Engng., Indian Inst. of Sci., Bangalore, India).

J. Indian Inst. Sci., vol.64, no.1, p.1-59 (Jan. 1983). [received: Sept. 1983]

The paper is a survey of the present state of understanding, prediction and control of turbulent flows, intended to be intelligible also to workers not directly involved in research in turbulence. 'Complex' turbulent flows, as affected by such factors as rotation, additional rates of strain, compressibility, etc., are not covered by the survey, but an attempt has been made to include all aspects of simpler flows in an incompressible fluid. Inevitably, the survey

is strongly influenced by the work done by the author himself and his colleagues. A major conclusion of the survey is that there are still wide gaps between the experimental discoveries being made on the structure of turbulent flows, the mathematical tools necessary for describing such structure, the numerical models invented for predicting turbulent shear flow behaviour, and the devices being tried for turbulence management. A great deal of work is necessary in all areas before these gaps can be bridged. (131 refs.)

113423 A method for turbulent flow calculations. H.-J.Maschek (Sektion Energieumwandlung, Tech. Univ. Dresden, Dresden, Germany). *Wiss. Z. Tech. Univ. Dresden (Germany)*, vol.32, no.2, p.167-70 (1983). In German.

Multi-parameter approaches to the analysis of turbulent flow are discussed, starting with a historical review from Taylor's (1938) turbulence spectrum. Turbulent flow is separated into micro-turbulence and macro-turbulence regions, and an attempt is made to explain numerical modelling. The consequences of empirical coefficient selection are considered and uncertainties are mentioned. (15 refs.) G.M.E.

113424 Reynolds stresses for unsteady turbulent flows. W.L.Hankey, W.Calarese (Air Force Wright Aeronautical Labs., WPAFB, OH, USA). *AIAA J. (USA)*, vol.21, no.8, p.1210-11 (Aug. 1983).

Reynolds averaged equations are currently employed in the numerical analysis of turbulent flows. In these equations an 'apparent stress' that requires empirical data (e.g. eddy viscosity) is introduced to close the system and permit calculation of the flowfield. A predicament arises when calculating unsteady turbulent flows in which the empirical apparent stress level is of concern. For example, if all of the apparent stress obtained experimentally over the whole frequency spectrum were used in the calculation, this value would be added to the stress generated by the numerical algorithm, causing overestimation of the turbulence. This error would produce excessive dissipation of the unsteady phenomenon with potential attendant disappearance of the unsteady solution. The authors address the procedure required to evaluate the frequency range of the Reynolds stress to be used for unsteady turbulent flows. To demonstrate the procedure, the Reynolds-averaged equations are examined for two-dimensional, incompressible flow. (4 refs.)

113425 Velocity statistics in premixed turbulent flames. R.K.Cheng, T.T.Ng (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). *Combust. & Flame (USA)*, vol.52, no.2, p.185-202 (Sept. 1983).

Laser Doppler velocimetry was used to measure velocity statistics in six unconfined v-shaped premixed ethylene/air turbulent flames with incident turbulence generated by grid or perforated plate. Also obtained were high speed schlieren movies of the turbulent flames. The results discussed include two components of mean and RMS velocities, probability density functions, macroscales, and Reynolds stress. In most cases, turbulent intensities increase within the flame zone. This increase is attributed to the intermittent measurement of the flow velocities in the burned and unburned states as the thin flame sheet fluctuates about the stationary measurement point. Reynolds stress also increases in the flame zone, but its sign suggests removal of turbulent kinetic energy. Therefore, conventional gradient transport modeling would break down for these flames. The sign of the Reynolds stress is in qualitative agreement with contributions due to intermittent measurement of the turbulent components in the burned and unburned states. These results show that the intermittency effect is a major influence on turbulent statistics in premixed flames and should require careful consideration in numerical models. (28 refs.)

113426 Experimental investigation of turbulent characteristics in the axisymmetric swirling flow. Yu.B.Kolesnikov, E.P.Sukhovich.

Lav. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.4, p.72-8 (1983). In Russian.

An experimental investigation of an averaged velocity component field and static pressure field is carried out, and six components of tensor stresses are measured in the finite swirling flow in a cylindrical channel. Near the channel axis unusual turbulent energy transfer to the mean flow is detected. In this case turbulent coefficients are essentially anisotropic over all the flow range, however near the axis they are negative. The results of this investigation are of interest for explanation of the effects associated with the influence of swirling on turbulent flow hydrodynamics. (12 refs.)

113427 Has a small-scale structure in turbulence been experimentally verified? F.D.Johnson, H.Eckelmann (Max-Planck-Inst. fur Stromungsforschung, Gottingen, Germany).

Phys. Fluids (USA), vol.26, no.9, p.2408-14 (Sept. 1983).

Various investigators have found considerable experimental evidence for small-scale flow structures in wall-bounded turbulent flow within the last 15 years. Experiments by Willmarth and Bogar in 1977 (*Phys. Fluids* 20, S9, October, part II, 1977) provided the high point to date in efforts to measure small-scale phenomena associated with turbulence; the unexpected results of these investigations were ascribed to extremely small flow structures of a scale which previously had remained undetected. Since publication of the work of Willmarth and Bogar, neither verifications nor contradictory results have been published by other investigators. The present experimental studies seem to contradict the thesis of Willmarth and Bogar, making small-scale phenomena responsible for the unusual results of their experiments. (9 refs.)

113428 Turbulent time scales and the dissipation rate of temperature variance in the thermal mixing layer. S.E.Elghobashi (Mech. Engng. Dept., Univ. of California, Irvine, CA, USA), B.E.Laund.

Phys. Fluids (USA), vol.26, no.9, p.2415-19 (Sept. 1983).

In a turbulent flow where the mechanisms and/or the importance of the generation processes of turbulent kinetic energy k and mean square scalar variance $\bar{\epsilon}^2$ are dissimilar, no simple connection exists between the turnover time scale of the fluctuating velocity and fluctuating scalar fields. To allow the computation of the turbulent scalar field in these situations a means of

calculating the scalar time is required. Here, in an extension of work by Newman, Launder, and Lumley (J. Fluid Mech. 111, 217, 1981), the time scale is obtained via a proposed transport equation for the dissipation rate of mean square scalar variance. The modeled equation has been applied successfully to the calculation of the spread of a thermal mixing layer in grid-generated turbulence and the decay of temperature variance in a homogeneous field. (12 refs.)

113429 Indirect measurement of the thermal-acoustic efficiency spectrum of a long turbulent burner. J.R.Mahan (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA), J.D.Jones, L.R.Blevins, J.G.Cline. *Rech. Aerosp. (France)*, no.4, p.311-21 (July-Aug. 1983). In French.

A new method is described for deducing the thermal-acoustic efficiency spectrum (defined as the fraction of combustion heat release converted to acoustic energy at a given frequency) of a long turbulent burner from the sound spectrum measured in the far field. The method, which is based on a one-dimensional model of the unsteady flow in the burner, is applied to a tubular diffusion-flame hydrogen burner whose length is large compared to its diameter. The results for thermal powers ranging from 4.5 to 22.3 kW show that the thermal-acoustic efficiency is relatively insensitive to the burner power level, decreasing from a value of around 10^{-4} at 150 Hz with a slope of about 20 dB per decade. Evidence is presented indicating that acoustic agitation of the flame below 500 Hz, especially in the neighborhood of the resonant frequencies of the burner, is a significant acoustic source. 47.25F Boundary layer and shear turbulence

113430 Experimental and numerical investigation of a turbulent boundary layer subjected to a sudden transverse strain. J.Cousteix, B.Aupoix (Office Nat. d'Etudes et de Recherches Aérospatiales, CERT, Toulouse, France), E.Arzuomanian, L.Fulachier. *Phys. Fluids (USA)*, vol.26, no.9, p.2399-407 (Sept. 1983).

A fully developed two-dimensional boundary layer on a cylinder is subjected to a sudden transverse strain by rotating the downstream part of the cylinder with a peripheral wall velocity approximately equal to the external velocity. This distorted boundary layer has a 'complex-flow structure'. The present paper deals with both experimental and numerical investigations of this complex flow. The experiments have been carried out in the near-wall region (buffer layer and viscous sublayer). Calculations have been made with a model of the $k-\epsilon$ type which takes into account the anisotropy of turbulent viscosity. Although the general agreement between experiment and calculations is good, some discrepancy, especially with respect to the behavior of the mean flow, is observed in the near-wall region and experiments do not support the linear evolution of the hodograph as predicted by calculations. The results suggest that the collaterality of the flow is first obtained in a very thin wall layer and extends progressively into the outer boundary layer. (23 refs.)

(see also 44.25 Convective and constrained heat transfer)

113431 Stagnation point heat transfer for Jet impingement to a plane surface. P.S.Shadlesky (Morton Thiokol Corp., Brigham City, UT, USA). *AIAA J. (USA)*, vol.21, no.8, p.1214-15 (Aug. 1983).

The author considers a finite jet impinging against an infinite plane, about which in comparison to the conventional convective flow and heat-transfer fields relatively little is known. A theoretical heat-transfer correlation has been derived that is an extension of the analyses presented by Square and Sibulkin incorporating a modification of the potential flow for a two-dimensional jet normal to a flat plate as given by Milne-Thomson (1960). In the neighbourhood of a stagnation point the flow can be considered incompressible and laminar regardless of the mainstream flowfield. This leads to a marked simplification of both the momentum and energy equations that becomes amenable to closed-form solutions. Although the flow is considered incompressible, the analysis should be applicable to supersonic conditions, provided the properties just downstream of the normal shock are selected as freestream conditions. (9 refs.)

113432 Heat transfer from an impulsively started circular cylinder. Lai-chen Chien, In-shieh Kung (Inst. of Phys., Acad. Sinica, Taipei, Taiwan). *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.248 (Dec. 1982). [received: Sept. 1983]

The analytic solution for forced convection heat transfer from an impulsively started heated circular cylinder is studied. The nonlinear energy equation is solved by the method of matched asymptotic expansion to the third order. A solution for the temperature field in term of exponential and error functions is

found. The time development of the temperature field is plotted. The local Nusselt number over the cylinder surface and progress of minimum Nusselt number point with time obtained are compared with the existing solutions with satisfactory results. (no refs.)

113433 Conjugate mixed convection heat transfer from a vertical rectangular fin. B.Sunden (Dept. of Appl. Thermo & Fluid Dynamics, Chalmers Univ. of Technol., Goteborg, Sweden). *Int. Commun. Heat & Mass Transfer (GB)*, vol.10, no.4, p.267-76 (July-Aug. 1983).

A numerical investigation of the heat transfer from a rectangular fin by combined forced and natural convection is presented. Results are given for buoyancy parameters in the range of $0 \leq Gr/Re^2 \leq 2$ and convection-conduction parameters in the range of $0 \leq \sqrt{Re} k_f/k_b \leq 10$. The results are compared with the convection fin theory and it is found that concerning the fin efficiency, the latter produces acceptable results although it is not strictly correct. (5 refs.)

113434 Free-stream turbulence effects on the heat transfer through the turbulent boundary layer behind a fence. A.Zukauskas (Acad. of Sci., Vilnius, Lithuanian SSR).

Int. Commun. Heat & Mass Transfer (GB), vol.10, no.4, p.277-86 (July-Aug. 1983).

Experimental results on the reattachment length and heat transfer behind the fence under a variable free-stream turbulence on air are presented. The study covered Re_{θ} from 2×10^5 to 2×10^6 , turbulence from 0.1 to 7%, and fence heights from 0.002 to 0.0135 m. Shorter reattachment lengths and augmented heat transfer at the reattachment were observed under higher turbulences. (10 refs.)

113435 The effect of Prandtl number on heat transfer from an isothermal rotating disk with blowing at the wall. P.H.Muir (Dept. of Computer Sci., Univ. of Toronto, Toronto, Canada), G.Fairweather, M.Vedha-Nayagam. *Int. Commun. Heat & Mass Transfer (GB)*, vol.10, no.4, p.287-97 (July-Aug. 1983).

Numerical results for heat transfer from an isothermal rotating disk with moderate to massive blowing at the wall are presented for a wide range of Prandtl numbers. Results show that for a given finite rate of blowing at the wall, the heat transfer rate first increases, reaching a maximum value before falling sharply, as the Prandtl number is increased. The maximum value of heat transfer rate decreases as the blowing rate increases. The phenomenon of boundary layer blow-off is also investigated. (23 refs.)

113436 Free convection flow through a porous medium bounded by two horizontal walls. C.Perdikis (Dept. of Mech., Univ. of Ioannina, Ioannina, Greece).

Int. Commun. Heat & Mass Transfer (GB), vol.10, no.4, p.357-9 (July-Aug. 1983).

Steady free convection flow through a porous medium bounded by two horizontal walls with a uniform axial temperature variation along the walls is considered. The author gives an analytical solution of the velocity field and discusses the effects of the permeability parameter K and Grashof number G on the velocity. (2 refs.)

113437 Heat transfer in laminar free convection near a vertical plate for fluids in the supercritical regions of state variables. V.N.Popov, G.C.Yan'kov (Moscow Power Inst., Moscow, USSR).

High Temp. (USA), vol.20, no.6, p.878-86 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1110-18 (Nov.-Dec. 1982). [received: Sept. 1983]

Heat transfer in laminar free convection near a vertical plate for water, carbon dioxide, and nitrogen in the supercritical region for boundary conditions $T_w = \text{const}$ and $q_w = \text{const}$ is calculated. It is shown that a consideration of the thermal conductivity peak has a significant effect on the results of heat-transfer calculations. An interpolation formula that gives the results of calculations of the Nusselt numbers for the considered substances for both types of boundary conditions and previously obtained data for helium is selected. The results of calculated are compared with experimental data and some empirical formulas. (27 refs.)

113438 Effects of viscous dissipation on temperature field in flows through ducts of nonuniform cross-section. C.V.Mahalakshmi (Dept. of Appl. Maths., Indian Inst. of Sci., Bangalore, India).

Indian J. Technol., vol.21, no.2, p.53-6 (Feb. 1983). [received: Sept. 1983]

An analytical expression for the temperature distribution for forced convective heat transfer in a flow through a tube of slowly varying cross-section is obtained taking into account the viscous dissipative effects. The Nusselt number is calculated. (12 refs.)

113439 Marangoni convection in cholesteric liquid crystals of low thermal sensitivity. I.I.Gorina, N.L.Sizova, I.G.Chistyakov (Inst. of Crystallography, Acad. of Sci., Leningrad, USSR).

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.271-8 (1983).

The Marangoni convection in a layer of nonthermosensitive cholesteric has been obtained. To induce the first stage of the convection (streaming the substance away from the 'hot' area), a local heating of the layer is necessary which is from 3 to 4 times as much as that required for thermosensitive cholesterics. The CLC convection motion structures of 'roll' type appeared when the layer was locally heated in a thermostat at temperatures close to the clearing point (T_a) of the cholesteric. The results obtained are discussed in terms of thermal stability of the original cholesteric texture. (5 refs.)

113440 Turbulent natural convection in a rectangular enclosure. C.Renault, Doan-Kim-Son (Lab. de Thermique, ENSMA, Poitiers, France). *Mech. Res. Commun. (GB)*, vol.10, no.4, p.245-51 (July-Aug. 1983).

As very little information is available about the structure of the natural convection flow in a rectangular cavity at high Grashof numbers, and with an aim at the further development of a numerical model, the authors have planned an experimental program in which the effects of the governing parameters, boundary conditions (insulation of walls), and inclination of the cavity are studied for Grashof numbers higher than 10^7 . The aim is to provide the first experimental contribution to the knowledge of the flow structure at $Gr_p = 8.3 \times 10^7$. (10 refs.)

113441 Ergodic stream-lines in steady convection. W.Arter (Culham Lab., UKAEA, Abingdon, England). *Phys. Lett. A (Netherlands)*, vol.97A, no.5, p.171-4 (29 Aug. 1983).

Stream-lines of steady Rayleigh-Benard convection with square planform are displayed using Poincaré maps. As the second order mode becomes more important the flow becomes ergodic from the boundaries inward, like a perturbed, integrable Hamiltonian system. (9 refs.)

113442 A pair of semicircle theorems in rotatory thermohaline convection. M.B.Banerjee, D.C.Katoch (Dept. of Math., Himachal Pradesh Univ., Simla, India), G.S.Dube, K.Banerjee. *Proc. Natl. Acad. Sci. India Sect. A*, vol.52, pt.2, p.150-8 (1982). [received: Aug. 1983]
The present investigation is concerned with the problem of obtaining bounds for the complex growth rate of an arbitrary oscillatory perturbation, neutral or unstable in the domain of infinitesimal amplitude instability in rotatory thermohaline convection. A pair of semicircle theorems, one each for both Stern's and Veronis' configurations, under the influence of a uniform rotation transverse to the fluid layer, are established in this connection. These results are new and are uniformly valid for all combinations of dynamically free and rigid boundaries. (4 refs.)

113443 Two-parameter study of the routes to chaos. A.Libchaber, S.Eauve, C.Laroche (Ecole Normale Supérieure, Paris, France). *Physica D (Netherlands)*, vol.7D, no.1-3, p.73-84 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).
The authors study the routes to chaos for a Rayleigh-Benard experiment in mercury, as a function of two parameters, the Rayleigh number (R) and the Chandrasekhar number (Q). For low Q the main route is a period-doubling cascade of bifurcations occurring at low R . For higher values of Q , two routes are observed, one related to a soft mode instability for moderate R , and a second one related to a three oscillators state, occurring at higher Rayleigh number values. (25 refs.)

113444 Oscillatory convection in a spherical cavity due to G-jitter. D.Langbein (Battelle-Inst. eV, Frankfurt-am-Main, Germany). Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.359-63
The convection caused by residual acceleration in an axial direction in a spherical cavity heated at the equator and cooled at the poles is investigated. The spherical cavity is intended to model in first order the melting zone in a typical crystal growth experiment under microgravity. The spherical symmetry is a concession to mathematical simplicity. The resulting shift of the isotherms is calculated. If in order to avoid striations of the growing crystal a shift of the solidification isotherm by less than $1\text{ }\mu\text{m}$ is required, the amplitude of residual accelerations of 1 Hz and 10 Hz must be smaller than 10^{-5} g and 10^{-3} g , respectively ($g=9.81\text{ m/s}^2$). 47.30 ROTATIONAL FLOW AND VORTICITY

113445 Flow and heat transfer on a disk rotating beneath a forced vortex. B.G.Newman (McGill Univ., Montreal, Quebec, Canada). *AIAA J. (USA)*, vol.21, no.8, p.1066-70 (Aug. 1983).
The integral method of von Karman for calculating the turbulent boundary layer on a rotating disk has been extended to cases for which the outer flow is rotating at a constant angular velocity. The method predicts the nondimensional radial mass flux, the windage, and, by analogy, the Nusselt number. It enables quick estimates to be made for the flow over the rear of compressor and turbine disks. (8 refs.)

113446 A vortex sheet method for calculating separated two-dimensional flows. M.Ribaut (Brown Boveri Ltd., Baden, Switzerland). *AIAA J. (USA)*, vol.21, no.8, p.1079-84 (Aug. 1983).
A mixed boundary condition problem for the time-average separated flow of a compressible and viscous fluid at high Reynolds number is formulated and solved by means of vortex and source integral equations involving vorticity diffusion. Application of the method to the flow past a flat plate and a blunt trailing-edge section has shown that the extension and underpressure of the

calculated wakes directly depend on the amount of vorticity diffusion and dissipation occurring in the flow. Computed velocity distributions and wake underpressures are compared with the experiment. (14 refs.)

113447 Vortex motion in the early stages of unsteady flow around a circular cylinder. Ling Guocan (Inst. of Mech., Acad. Sinica, Peking, China). *Acta Mech. Sin. (China)*, no.3, p.209-16 (1983). In Chinese.
The early stages of vortex motion in the near wake of unsteady flow around a circular cylinder at high Reynold's number is investigated, by combining the discrete vortex model with boundary layer theory and by taking into consideration the separation of boundary layer and rear shear layer in the recirculating flow region. The development of flow structures and vortex motion, particularly the formation and growth of secondary vortices and their effect on the flow field are calculated. The calculated results clearly show that the flow structures and vortex motion go through a series of complicated processes before the symmetric main vortices become asymmetric: development of main vortices induces secondary vortices; growth of the secondary vortices causes the symmetric main vortex sheets to break off and the symmetric main vortices to become free vortices, while a pair of secondary vortices is formed; then the vortex sheet, after breaking off, gradually extends downstream and a pair of secondary vortices become loose. Positions of separation point, pressure and velocity distributions on the surface and drag coefficients are also given. (26 refs.)

113448 The boundary perturbation solution of the fluid flow between two co-axial cones, which are in relative rotation, with axial flow. Chu Yuenrei (Dept. of Engng. Mech., Jiaotong Univ., Shanghai, China). *Acta Mech. Sin. (China)*, no.3, p.217-26 (1983). In Chinese.
The fluid flow between two relatively rotating co-axial cones with axial flow is investigated. The flow is governed by the Navier-Stokes equations. It is extremely difficult to obtain an accurate solution, but if the cone angle is assumed to be small then a boundary perturbation scheme can be developed. The asymptotic analytical solution of this flow is given. (3 refs.)

113449 First order numerical solution of the statistical vorticity structure theory of homogeneous isotropic turbulence. Wei Zhonglei, Li Wenxuan (Peking Univ., Peking, China). *Acta Mech. Sin. (China)*, no.3, p.241-8 (1983). In Chinese.
This is a further development of the vorticity structure theory of homogeneous isotropic turbulence by P.Y. Chou and Y.N. Huang (1975). (4 refs.)

113450 Impulsively started viscous flow over a rotating circular cylinder. Lai-Chen Chien, Ching-Shang Chen (Inst. of Phys., Acad. Sinica, Taipei, Taiwan). *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.77-86 (Dec. 1982). [received: Sept. 1983]
The impulsively started flow of an incompressible viscous fluid over a circular cylinder with circulation is studied. Because of the impulsive start, there is a singularity at time zero plus. The accurate solution in the neighborhood of the singularity by the matched asymptotic expansion to the second order is extended to the third order. Then the analytic solutions considered for the viscous layer are employed as initial conditions for numerical integration to obtain the solutions for larger time. The finite difference scheme adapted for the vorticity equation is the hopscotch method and that for the Poisson equation is the direct method. The time development of the flow properties, lift and moment coefficients are obtained and plotted. (8 refs.)

113451 A steady rotational plane gas flow problem by hodograph method. O.P.Chandna, A.Murgai, G.W.Rankin (Univ. of Windsor, Windsor, Ontario, Canada). *Int. J. Eng. Sci. (GB)*, vol.21, no.12, p.1443-9 (1983).
The geometry and the solutions are investigated for steady rotational plane gas flows with arbitrary equation of state when the velocity magnitude is constant along each individual streamline by using the hodographic technique. (5 refs.)

113452 Vortex structure of circular jets in crossflow. N.Rajaratnam (Univ. of Alberta, Edmonton, Alberta, Canada), T.Gangadharaiah. *J. Wind Eng. & Ind. Aerodyn. (Netherlands)*, vol.12, no.2, p.155-64 (July 1983).
Presents the results of an experimental study of the properties of the bound vortex system housed in a circular jet issuing perpendicularly into a crossflow for three values of the ratio of the jet to crossflow velocity equal to 2.73, 4.52 and 7.05. (10 refs.)

113453 On the geometry of vortex-line in rotating viscous incompressible hydromagnetic fluid flows. G.Purushotham (Nagrunasagar Engng. Coll., JNT Univ., Hyderabad, India), M.A.Rasheed. *Proc. Natl. Acad. Sci. India Sect. A*, vol.52, pt.2, p.194-206 (1982). [received: Aug. 1983]
Following Bjorgum (1951), Bjorgum and Godal (1952) description of the geometries of vortex-line triad O^3 in an anholonomic space is completed and is utilised to study the kinetic and the kinematic properties of steady, rotating, viscous, incompressible hydromagnetic fluid flows, which generalise the studies of Gopalkrishna and Ramchandra Rao (1975). The role of Beltrami and complex-lamellar characters of the vortex-lines are examined to study the kinematic properties of the flows described. (15 refs.)

113454 Growth of localized disturbances on a vortex sheet. A.D.D.Craik (Dept. of Appl. Math., Univ. of St. Andrews, St. Andrews, Scotland). *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.94, pt.1-2, p.85-8 (1983).
Linearized local disturbances on a vortex sheet are known to develop singularities after a finite term in some cases but not in others. A simple test for the appearance of such singularities is given in terms of the Fourier transform of the initial disturbance. Such singularities are a consequence of the artificiality of the vortex sheet model and should not be regarded as physically meaningful. (11 refs.)

113455 Coadjoint orbits, vortices, and Clebsch variables for incompressible fluids. J.Marsden, A.Weinstein (Dept. of Maths., Univ. of California, Berkeley, CA, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.305-23 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).
This is a study of incompressible fluids, especially their Clebsch variables and vortices, using symplectic geometry and the Lie-Poisson structure on the dual of a Lie algebra. Following ideas of Arnold (1978) and others it is shown that Euler's equations are Lie-Poisson equations associated to the group of volume-preserving diffeomorphisms. The dual of the Lie algebra is seen to be the space of vorticities, and Kelvin's circulation theorem is interpreted as preservation of coadjoint orbits. In this context, Clebsch variables can be understood as momentum maps. The motion of N point vortices is shown to be identifiable with the dynamics on a special coadjoint orbit, and the standard canonical variables for them are a special kind of Clebsch variables. Point vortices with cores, vortex patches, and vortex filaments can be under-

stood in a similar way. This leads to an explanation of the geometry behind the Hald-Beale-Majda convergence theorems for vorticity algorithms. Symplectic structures on the coadjoint orbits of a vortex patch and filament are computed and shown to be closely related to those commonly used for the KdV and the Schrödinger equations respectively. (64 refs.)

113456 Bifurcation of stationary vortex configurations. II. Topology and integrability. J.J.Palmore (Univ. of Illinois, Urbana, IL, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.324-9 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

For pt.I see Nonlinear Problems: Present and Future, p.127, (1982). Studies the dynamics of finitely many vortices in a circular disk and compare the integrability of this problem with that of Kirchhoff's problem of vortices in the plane. The effect of the topology of the phase space on the two Hamiltonian systems is compared. The goal is to apply topological methods uniformly to investigate the flow of these dynamical systems. 47.35 WAVES

113457 Second order wave diffraction by large cylinders. M.Rahman (Dept. of Appl. Math., Tech. Univ. of Nova Scotia, Halifax, Nova Scotia, Canada).

Int. J. Eng. Sci. (GB), vol.21, no.12, p.1471-82 (1983). A non-linear mathematical model of diffraction theory is formulated to evaluate the wave forces on large cylinders. An attempt is made to amend the coefficient of mass C_M arising in the Morison equation on the linear theory by introducing second-order effects on the irrotational flow part of the wave loading. Analytical solutions are obtained and compared with the experimental data collected by the Hydraulics Laboratory of the National Research Council of Canada, Ottawa. The comparison shows favourable agreement. (9 refs.)

113458 Cyclic gravity waves in deep water. P.J.Bryant (Maths. Dept., Univ. of Canterbury, Christchurch, New Zealand).

J. Aust. Math. Soc. Ser. B (Australia), vol.25, pt.1, p.2-15 (July 1983). Numerical evidence is presented for the existence of unsteady periodic gravity waves of large height in deep water whose shape changes cyclically as they propagate. It is found that, for a given wavelength and maximum wave height, cyclic waves with a range of cyclic periods exist, with a steady wave of permanent shape being an extreme member of the range. The method of solution, using Fourier transforms of the nonlinear surface boundary conditions, determines the irrotational velocity field in the water and the water surface displacement as functions of space and time, from which properties of the waves are demonstrated. In particular, it is shown that cyclic waves are closer to the point of wave breaking than are steady permanent waves of the same wave height and wavelength. (4 refs.)

113459 The stability of internal solitary waves. D.P.Bennett, R.W.Brown, S.E.Stansfield, J.D.Stoughair (Phys. Dept., Case Western Reserve Univ., Cleveland, OH, USA), J.L.Bona.

Math. Proc. Cambridge Philos. Soc. (GB), vol.94, pt.2, p.351-79 (Sept. 1983). A theory is developed relating to the stability of solitary-wave solutions of the Benjamin-Ono equation. This equation is a model for the propagation of internal waves in an incompressible nondiffusive heterogeneous fluid for which the density is nonconstant only within a layer whose thickness is much smaller than the total depth. The authors deal with the full nonlinear problem, and so allowance is made for small but finite perturbations of the solitary-wave solutions of the Benjamin-Ono equation. A result about stability which is practically satisfactory, in that it bears upon the size and shape of the wave in question is presented. (39 refs.)

113460 Destabilization of an initially stable shear flow by internal waves. L.Sh.Tsimring (Inst. of Appl. Phys., Acad. of Sci., Gorkii, USSR).

Oceanology (USA), vol.22, no.4, p.396-9 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983] The effect of a train of internal waves of finite spectral width on shear flow in the neighborhood of the critical layer is analyzed in the quasilinear approximation. The resulting equation describes the deformation of the mean velocity profile. The simple Riemann wave solution for this equation shows that the interaction of the internal waves with the critical layer accelerates the flow and increases the shear velocity in the lower part of this layer. Characteristic times, at which instabilities are generated in the flow by the internal waves, are estimated. (13 refs.)

113461 Nonlinear waves: from hydrodynamics to plasma theory. E.Infeld (Inst. Badan Jadrowych, Warszawa, Poland).

Postepy Fiz. (Poland), vol.34, no.3, p.215-36 (1983). In Polish. Nonlinear hydrodynamic and plasma wave phenomena are considered jointly. A survey of recent theoretical, numerical, and experimental results is given. The bias, if any, is towards plasma physics, but analogies are stressed. (80 refs.)

113462 Surface waves induced by an impinging jet. M.J.Miksis, Lu Ting (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA).

Phys. Fluids (USA), vol.26, no.9, p.2378-84 (Sept. 1983). The oblique impact of a thin or slender jet on the free surface of a semi-infinite stream is studied. Based on the thickness or radius of the jet the Froude number is assumed to be large and the fluid is assumed to be viscous.

By the method of matched asymptotics, the leading term of the solution behind the impact area is constructed. The perturbation solution for the stream away from the impact region and its wake is shown to be equivalent by the linear theory of surface waves with a concentrated load at the impact point and a distributed line load along the wake. The equivalent loads are consistent with considerations of mass and momentum balances and other judicial arguments. (8 refs.)

113463 Some new gravity waves in water of finite depth. J.-M.Vanden-Broeck (Dept. of Math., Univ. of Wisconsin, Madison, WI, USA).

Phys. Fluids (USA), vol.26, no.9, p.2385-7 (Sept. 1983). The results of Chen and Saffman (1980) showing that periodic gravity waves in water of infinite depth are not unique, are generalized for waves in water of finite depth. Some new types of waves are discovered and discussed. (6 refs.)

113464 The calculation of nonlinear short-crested gravity waves. A.J.Roberts (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).

Phys. Fluids (USA), vol.26, no.9, p.2388-92 (Sept. 1983). A numerical method involving truncated Fourier series is presented for the calculation of properties of short-crested water waves. The method produces accurate results over much of the nonlinear regime. In the case of infinite water depth, calculated results include a representative wave profile and the variation in frequency and energy densities with wave steepness and planform skewness. (12 refs.)

113465 Self-refraction of nonlinear capillary-gravity waves. P.P.Banerjee, A.Korpe, K.E.Lonngrén (Dept. of Electrical & Computer Engng., Univ. of Iowa, Iowa City, IA, USA).

Phys. Fluids (USA), vol.26, no.9, p.2393-8 (Sept. 1983). Self-refraction effects have been observed during the propagation of deep-water capillary-gravity waves. The observations are shown to be in qualitative agreement with the theory of self-focusing and defocusing in a cubically nonlinear medium in the presence of diffraction. (8 refs.)

113466 Interaction of rotating waves in an active chemical medium. V.I.Krinsky, K.I.Agladze (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).

Physica D (Netherlands), vol.8D, no.1-2, p.50-6 (July 1983). The interaction of autowave sources is experimentally studied in an active chemical medium with excitable kinetics. Three types of vortices are considered: (1) A spiral wave (S) rotating in a simply-connected medium; (2) a spiral wave rotating around a hole (SH); and (3) a spiral wave (S_N) with topological charge N . It is found that S synchronizes SH (except for very small holes), and spiral waves with lower topological charge synchronize those with higher topological charge. It is also found that the interaction of autowave sources displays some unique properties because of their ability to appear on inhomogeneities, to vanish and to move in the medium. A new phenomenon of induced drift of spiral waves is demonstrated. The drift was induced by high-frequency concentration waves propagating in the medium. A similar drift is observed upon interaction of vortices. The mechanism of the induced drift is explained in terms of wave-break translocation from one wave to another. Using this effect, one can control the location of wave sources in an active medium. (15 refs.)

(see also 28.70 Nuclear explosions, 52.35T Plasma shock waves)

113467 On intrinsic properties of viscous, compressible steady plane flows. P.A.Reddy (Evening Coll., Secunderabad, India).

Proc. Natl. Acad. Sci. India Sect. A, vol.52, pt.1, p.99-103 (1982). [received: Aug. 1983] Defining an orthogonal plane geometric net related to the stream-lines and their orthogonal trajectories in an anholonomic space, intrinsic properties of viscous, compressible steady plane flows are studied and enquired as how far the geometry describes the physical laws of the flows under study. (6 refs.)

113468 Effect of the number density of heterogeneities on the critical diameter of condensed explosives. R.Engelke (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Phys. Fluids (USA), vol.26, no.9, p.2420-4 (Sept. 1983). Experiments are reported which examine the dependence of the critical diameter of a condensed explosive on the number density of heterogeneities present within the material. The form and quantity of heterogeneities present were closely controlled by constructing the heterogeneous materials from a homogeneous one. Reductions in critical diameter of over 40% were produced in some cases, even though a chemically inert material was being introduced into the explosive. The experiments indicate that the distance between heterogeneities is an important parameter in the production of a critical-diameter reduction. (13 refs.)

113469 Ray method for flow of a compressible viscous fluid. M.C.Shen (Dept. of Math., Univ. of Wisconsin, Madison, WI, USA).

SIAM J. Appl. Math. (USA), vol.43, no.4, p.822-33 (Aug. 1983). An asymptotic method is developed for the solution of linear equations governing compressible viscous flow with free surface. The approach used is based upon the ray expansion originally developed by Keller (1978). A general uniform asymptotic expansion is also constructed to remove anomalies where an amplitude function in the ray method expansion becomes infinite. (12 refs.)

113470 Effect of thermal relaxation of attenuation of shock waves in two-phase medium. V.A.Vakhnenko, V.M.Kudinov, B.I.Palamarchuk (Inst. of Electric Welding, Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.18, no.12, p.1126-33 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.91-7 (Dec. 1982). [received: Sept. 1983]

For the purpose of analyzing the effect of relaxation processes on the attenuation of strong shock waves, the authors consider a homogeneous two-phase medium consisting of a gaseous phase and a condensate phase. An explosion occurs in this medium and, as a result, an energy E producing a shock wave be released instantaneously within an infinitesimally small volume. A number of assumptions are made. 47.40H Transonic flows

113471 Finite element methods for transonic flow analysis. K.E.Tatum (McDonnell Douglas Corp., St. Louis, MO, USA). *AIAA J. (USA)*, vol.21, no.8, p.1071-8 (Aug. 1983).

A finite element method (FEM) for solution of the conservative full potential flow equation is presented as a means for improving the computation of transonic flows about complex geometries. The method does not require and orthogonal mesh, thus removing a major constraint in grid generation. A standard Galerkin finite element formulation is used in conjunction with the artificial compressibility method which stabilizes the algorithm in transonic flow and allows the capture of embedded shock waves. Solution comparisons, including one test case which stresses the capabilities of state-of-the-art finite difference methods, verify the FEM accuracy and geometric capability. (16 refs.)

113472 Thermal waves in a supersonic boundary layer with self-induced pressure. A.I.Derzhavina.

Appl. Math. & Mech. (USA), vol.46, no.4, p.503-8 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.635-41 (1982). [received: Sept. 1983]

The linear problem of temperature perturbation on a flat plate in a supersonic stream of gas is considered using the asymptotic theory of plane flow in a boundary layer with free interaction. The problem is solved by applying the Fourier transform in the longitudinal coordinate. The effect of wall temperature variations on the physical characteristics of the gas flow in the boundary layer is investigated. Numerical application of the inverse Fourier transform is used for determining the effect of a given temperature variation on the pressure distribution. (9 refs.)

47.40N Shock-wave interactions

113473 Flame velocity for the onset of detonation. T.Inomata, S.Okazaki, T.Moriwaki, M.Suzuki (Sophia Univ., Tokyo, Japan).

AIAA J. (USA), vol.21, no.8, p.115-18 (Aug. 1983).

Of interest in this study was the collision of a flame with a shock wave emitted from the flame itself and propagated in the opposite direction to the flame after reflection at the end of a combustion tube. The transition to detonate occurred at a critical initial pressure for various tube lengths. It did not begin below a certain limit of the flame velocity. Relations between the detonation induction distance and the minimum flame velocity leading to the detonation and relations between the flame velocity at the collision point and the distance from the collision point and the detonation point are presented. (15 refs.)

113474 The regular case of shock wave diffraction on a wedge partly submerged in fluid. K.A.Bezhanov.

Appl. Math. & Mech. (USA), vol.46, no.4, p.497-502 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.628-34 (1982). [received: Sept. 1983]

The pattern of diffraction at the gas-liquid interface, induced by a system of oncoming shock waves of regular interaction in gas impinging on a wedge submerged in the liquid is considered. The wedge of arbitrary angle has its apex at the unperturbed interface with one of its sides at a nearly straight angle to the liquid unperturbed surface. The liquid is assumed only slightly compressible, which makes it possible to consider the problem in linear formulation by the methods proposed. (12 refs.)

113475 Growth and decay of acceleration waves in relaxing gases. A.Rai, K.S.Pandey (School of Appl. Sci., Banaras Hindu Univ., Varanasi, India).

Indian J. Technol., vol.21, no.1, p.5-7 (Jan. 1983). [received: Sept. 1983]

The propagation of acceleration waves has been studied along the characteristic path using the characteristics of the governing quasi-linear system with vibrational relaxation. The law of propagation is determined and the problem of growth and decay of waves has been solved. The critical time t_c is determined when the breakdown of the wave occurs. It is concluded that there exists a critical value of the initial amplitude of the acceleration wave such

that all compressive waves with initial amplitude greater than the critical one will terminate into a shock wave. An initial amplitude less than the critical one will result in a continuous decay. It is also concluded that vibrational relaxation has a stabilizing effect on the wave propagation. (8 refs.)

113476 Molecular velocity distribution functions in an argon normal shock wave at Mach number 7. T.Holtz, E.P.Muntz (Univ. of Southern California, Los Angeles, CA, USA).

Phys. Fluids (USA), vol.26, no.9, p.2425-36 (Sept. 1983).

The streamwise and normal moments of molecular velocity distribution functions throughout an argon normal shock wave have been measured in a Mach number 7.18 wind tunnel flow, and the experimental data have been compared with several analytical and numerical solutions. In the experiments, the molecular population distributions parallel and perpendicular to the direction of flow were derived using a Fabry-Perot etalon to resolve the Doppler shifts in electron-beam-stimulated fluorescence of the gas atoms. Predictions from Monte Carlo techniques give close agreement with the details of the experimental nonequilibrium distribution function contours. Bimodal Maxwellian and ellipsoidal functional forms show only general agreement with overall profile breadth. (37 refs.)

113477 Propagation of strong detonation waves in a dispersed mixture. I.S.Men'shov (V.A. Steklov Math. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1009-11 (Dec. 1982). Translation of:

Dokl. Akad. Nauk SSSR, vol.267, no.4-6, p.808-11 (Dec. 1982). [received: Sept. 1983]

The author examines the problem of propagation of a strong detonation wave in a two-phase medium consisting of gas and solid particles. A difference in the velocities and temperatures of the phases can have a large effect on the structure of the flow of the mixture. (6 refs.)

113478 Structure of detonation waves with unsteady wave fronts in condensed media. V.A.Danilenko, V.M.Kudinov (E.O. Paton Inst. of Electric Welding, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1052-3 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.841-3 (Dec. 1982). [received: Sept. 1983]

The authors present results of a physical and a numerical experiment on the structure of the detonation front in liquid-saturated porous explosives and explosive suspensions arranged in cylindrical charges. (11 refs.)

47.50 NON-NEWTONIAN DYNAMICS

113479 Local existence theorems for the first and second initial-boundary value problems for a weakly non-Newtonian fluid. M.Renardy (Math. Res. Center, Univ. of Wisconsin, Madison, WI, USA).

Arch. Ration. Mech. & Anal. (Germany), vol.83, no.3, p.229-44 (1983).

The author proves an existence and uniqueness theorem for three-dimensional motions of a certain class of simple, incompressible materials. The constitutive equation is assumed to have, in addition to a Newtonian part, a viscoelastic part given by a smooth, bounded functional of the history of the displacement gradient. Both displacement and traction boundary conditions are considered. (19 refs.)

113480 A note on the Falkner-Skan flows of a non-Newtonian fluid. K.R.Rajagopal (Dept. of Mech. Engng., Univ. of Pittsburgh, Pittsburgh, PA, USA), A.S.Gupta, T.Y.Na.

Int. J. Non-Linear Mech. (GB), vol.18, no.4, p.313-20 (1983).

Non-similar solutions are established for the boundary layer flow of a homogeneous incompressible fluid of second grade past a wedge place symmetrically with respect to the flow direction. The variation of the skin-friction with respect to the non-Newtonian parameters is discussed. (11 refs.)

113481 Shear rate dependence of non-Newtonian viscosity of fluids. Byung Chan Eu (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2315-24 (1 Sept. 1983).

A pair of analytic formulas for the shear viscosity of simple fluids are derived from kinetic equations as functions of shear rate ($\dot{\gamma}$), temperature, and density. One of the formulas is of the form $\eta = \eta_0 \ln[\tau\dot{\gamma} + (1 + \tau^2\dot{\gamma}^2)^{1/2}]/(\tau\dot{\gamma})$, where $\chi = \sqrt{2}\gamma$ and τ is a function of Newtonian shear viscosity η_0 , temperature, and density. The shear viscosities calculated with the formulas compare well with the molecular dynamics shear viscosities of argon. (11 refs.)

113482 Fundamental matrices in micropolar fluids. L.Dragos (Faculty of Math., Bucharest, Rumania), D.Homentcovschi.

Z. Angew. Math. & Mech. (Germany), vol.63, no.8, p.389-91 (1983).

A direct derivation of the two- and three-dimensional fundamental matrices and solutions for the equations of incompressible micropolar fluids which have a steady motion is presented and the integral representation of the solutions of the equations of motion by means of these matrices, is given. 47.55 NONHOMOGENEOUS FLOWS

113483 The streamline behaviour near the separation point and separation criterion for viscous flow. Zhang Hanxin, Lu Linsheng, Yu Zechu (Chinese Aerodynamic Res. & Dev. Center, China).

Acta Mech. Sin. (China), no.3, p.227-32 (1983). In Chinese.

The streamline behaviour near the separation point of steady and unsteady viscous flow is studied, and the separation criteria are discussed. It is pointed out that the MRS criterion is necessary when there are two lines with $u=0$, passing through the separation point. For flow described by boundary layer equations, the separation point is a Goldstein singularity, and the MRS criterion is equivalent to the singularity criterion. However, for flow described by Navier-Stokes equations, the separation point is not a singularity, so the singularity criterion is not valid. (8 refs.)

47.55B Cavitation

- 113484 Comparison of some tubular and Kaplan turbine properties.** J.Kirejczyk (Inst. Maszyn Przepływowych PAN, Gdansk, Poland). *Energetyka (Poland)*, vol.37, no.4, p.148-52 (April 1983). In Polish. [received: Sept. 1983]
 Describes flow, cavitation, dynamic and operating properties of tubular turbines and explains the advantages of their use. Some of the properties are compared with those of Kaplan turbines. (18 refs.)
- 113485 Experimental investigation of shock waves produced in water when a cavitation bubble collapses.** G.V.Dreiden, A.P.Dmitriev, Yu.I.Ostrovskii, M.I.Etinberg (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.191-3 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.311-14 (Feb. 1983). [received: Sept. 1983]
 The velocity of shock waves has been measured for shock waves produced by collapsing bubbles in water. The bubbles were produced by focusing light from a pulsed ruby laser to a point in water. The velocity of the shock waves was determined from dark-field Schlieren photographs using double laser pulses produced by an optical delay line. The shock wave velocities were used to calculate the shock wave pressure. The formation of radially irregular regions surrounding a collapsing bubble is explained, and it is found that they form when the gas-liquid interface moves toward the center of collapse of the 'crinkled' boundary of the bubble. (8 refs.)

47.55C Jets

- 113486 Acoustic interaction with a turbulent plane jet—some effects on turbulent structure.** F.W.Chambers (Lockheed-Georgia Co., Marietta, GA, USA), V.W.Goldschmidt. *AIAA J. (USA)*, vol.21, no.8, p.1057-8 (Aug. 1983).
 Results of a study to determine the nature of the interaction mechanism linking an applied sound field and an incompressible turbulent plane jet are reported. Measurements of the effects of applied sound on the jet mean flow behaviour and measurements of turbulence intensities, Reynolds shear stresses, and turbulent energy spectra were performed and reported by Chambers and Goldschmidt (1982). The results of some of the turbulence measurements and the conclusions that may be drawn about the interaction mechanism are presented. (8 refs.)
- 113487 Numerical study on flow developments for the rise of buoyant plumes in a stratified environment.** R.R.Hwang, Chyi-Jang Shiau (Inst. of Phys., Acad. Sinica, Taipei, Taiwan). *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.251 (Dec. 1982). [received: Sept. 1983]
 A numerical technique for integrating the full Navier-Stokes and diffusion equations through an initial value problem has been used to investigate the time development of a line buoyant source issuing in a density-stratified environment. The basic physical features and some structures of the interactions of the motion at the intermediate mixing region are obtained. The stratification tends to inhibit the flow development of the buoyant source and to encourage the formation of a recirculatory vortex on the lower region near the source and the upper region. (no refs.)
- 113488 Axial coherence functions of circular turbulent jets based on an inviscid calculation of damped modes.** P.Plaschko (Hermann-Fottinger-Inst. für Thermo- und Fluidodynamik, Tech. Univ. Berlin, Berlin, Germany). *Phys. Fluids (USA)*, vol.26, no.9, p.2368-72 (Sept. 1983).
 It is often assumed that damped instability modes may exist even in the absence of viscosity, if during the downstream evolution of the waves, velocity gradients become so small to support amplified disturbances. A modified inviscid calculation of damped modes is done, and the corresponding eigenvalues are compared with those given by the Orr-Sommerfeld theory. It is shown that the use of inviscid results in a slow-flow divergence stability and in a linear turbulence model yields theoretical predictions for amplitudes, phases, and coherence functions that are in reasonable agreement with experimental trends. 47.55H Stratified flows

- 113489 Laboratory study on the two-dimensional flows of stratified fluids over barriers.** R.R.Hwang, Shain-Way Jang (Inst. of Phys., Acad. Sinica, Taipei, Taiwan). *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.249 (Dec. 1982). [received: Sept. 1983]
 Describes an experimental study of a stratified fluid of finite depth flowing over obstacles which induce flow separation and turbulence on the lee side, in which the inviscid model is no longer useful. Various properties of the flow field, such as the development of lee waves behind the obstacle, the blocking effect upstream, the effect of viscosity, and in particular the criterion for the onset of gravitational instability in the lee-wave field are observed and analysed. Lee waves produced by obstacles in stratified flow depend on the internal Froude number, the ratio of the height of obstacles to the channel depth, the ratio of the height to the half width of obstacles and the Reynolds number of the flow. Therefore, the existence of upstream influence and the flow separation induced by the obstacle have great effect in some flow conditions on the development of the lee-wave field. (no refs.)

- 113490 Viscous flows of stably stratified fluids over semi-circular obstacles.** R.R.Hwang, Shain-Way Jang (Inst. of Phys., Acad. Sinica, Taipei, Taiwan). *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.252 (Dec. 1982). [received: Sept. 1983]
 Numerical techniques of the ADI method for integrating the time-dependent Navier-Stokes equations, which have proven useful in the study of homogeneous viscous flows, have been extended to handle the flow of a stably stratified viscous fluid over a ridge of semi-circular cylinders of infinite length. Various properties of the flow field and the characteristics of the lee waves formulated are investigated. The stratification tends to encourage the development of overturning flow regions (rotors) on the lee slope of the ridge and the formation of such region on the upstream slope and down-stream from the ridge. For stratified flows over obstacles, the fluid below the top of the obstacle becomes partially blocked for flows with slow motion or small values of internal Froude number. (no refs.)

47.55K Multiphase flows

- 113491 Diffusional transport of nonspherical aerosol particles.** J.Heyder, G.Scheuch (Gesellschaft für Strahlen- und Umweltforschung mbH, Frankfurt am Main, Germany). *Aerosol Sci. & Technol. (USA)*, vol.2, no.1, p.41-4 (1983).
 The diffusional losses of spheres and particles consisting of two equal spheres in contact (dumbbells) from laminar aerosol-flows on surfaces of cylindrical tubes were measured with a laser aerosol size spectrometer. From losses of the nonspherical particles in the tubes a diameter could be calculated for a fictitious sphere that would have been lost in the tubes with the same average probability as the nonspherical particle. This diameter is termed the thermodynamic diameter of the nonspherical particle. It was larger than the volume equivalent diameter of the nonspherical particles. The shape factors were 1.052 for dumbbells consisting of two 82 nm spheres and 1.069 for dumbbells consisting of two 102 nm spheres. (6 refs.)
- 113492 Use of a generalized Stokes number to determine the aerodynamic capture efficiency of non-Stokesian particles from a compressible gas flow.** R.Israel, D.E.Rosner (Chem. Engng. Dept., Yale Univ., New Haven, CT, USA). *Aerosol Sci. & Technol. (USA)*, vol.2, no.1, p.45-51 (1983).
 The aerodynamic capture efficiency of small but non-diffusing particles suspended in a high-speed stream flowing past a target is known to be influenced by parameters governing (a) small particle inertia, (b) departures from the Stokes drag law (associated with local particle Reynolds numbers greater than unity), and (c) carrier fluid compressibility (at nonnegligible free-stream Mach numbers). By defining an effective Stokes number in terms of the actual (prevailing) particle stopping distance, local fluid viscosity, and inviscid fluid velocity gradient at the target nose. The authors show that these effects are well correlated in terms of a 'standard' (cylindrical collector, Stokes drag, incompressible flow $Re^{1/2} \gg 1$) capture efficiency curve. They are thus led to a correlation that (a) simplifies aerosol capture calculations in the parameter range already included in previous numerical solutions, (b) allows rational engineering predictions of deposition in situations not previously specifically calculated, (c) should facilitate the presentation of performance data for gas cleaning equipment and aerosol instruments. (15 refs.)
- 113493 Equilibrium parameters behind a shock wave in wet vapor.** N.M.Kuznetsov, E.I.Timofeev, B.E.Gelfand (Inst. of Chem. Phys., Acad. of Sci., USSR). *High Temp. (USA)*, vol.20, no.6, p.917-21 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1153-7 (Nov.-Dec. 1982). [received: Sept. 1983]
 Relations are presented for the shock wave speed and the specific volume. The authors have investigated regions of condensation or evaporation behind the shock front as a function of the state of the water vapor mixture ahead of the wave. They have determined conditions for which there is transition from condensation to evaporation. It is shown that for low values of the specific volume, close to that of the liquid, there is always condensation of vapor behind the shock. For large initial values of specific volume there is partial vapor condensation behind the shock wave, and this is replaced by evaporation as the pressure in the wave increases. (9 refs.)
- 113494 Motion and precipitation of a cloud of hot particles.** G.M.Makhviladze, O.I.Melikhov (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1054-6 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.844-7 (Dec. 1982). [received: Sept. 1983]
 The authors consider the case of gas suspensions having a small volume fraction of particles, $\alpha_2 \ll 1$, and a small ratio of the true densities of the phases, $\epsilon = \rho_{10}/\rho_2 \ll 1$. It is assumed that the temperature is constant over the volume of a particle, that the collisions, fractionation, and evaporation of the particles are not important, that the viscous dissipation of energy does not come into play, and that the viscosity η and thermal conductivity λ are constant. (6 refs.)
- 113495 Vibration effects in bodies with a gas-liquid medium.** V.D.Kubenko, V.D.Lakiza, V.S.Pavlovskii, N.A.Pelykh (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.18, no.12, p.1109-18 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.72-82 (Dec. 1982). [received: Sept. 1983]
 Investigates the dynamic behavior and the stability of gas bubbles and their local accumulations in homogeneous and two-layer liquids with allowance for such factors as vibrations of the free surface of the liquids and their interface, the elastic properties of the carrying body, and the interaction of the gas-liquid system with the carrying body and the vibration source, which have a significant effect on the realization of various modes in such systems. (9 refs.)
- 113496 Relaxation processes in aerosol streams with polydisperse particle phase.** P.Roth (Univ. Gesamthochschule, Duisburg, Germany), K.Thielen. *Z. Angew. Math. & Mech. (Germany)*, vol.63, no.8, p.341-8 (1983). In German.
 Starting from the principles of two-phase-flow theory the relaxation process of an aerosol with very small polydisperse solid particles behind shock waves has been studied. Different size distributions of the particles in the initial state have been assumed. The overall volume concentration of the particles should be small. Therefore the exchange processes between the phases have a weak influence on the gas phase, only. For the momentum and heat transfer proc-

esses, molecular effects have been taken into account by simple Knudsen number corrections. Different computations show the time-dependent deformation of the particle size distribution function during the aerosol relaxation behind shock waves. (15 refs.)

113497 Study of momentum transfer in two-fluid formulation of two-phase flow. G.Egely, P.Saha.

Report KFKI-1983-84, Hungarian Acad. Sci., Budapest (1983), 22 pp.

The following topics were dealt with: Advanced nuclear safety codes such as TRAC and RELAP5 use two-fluid hydraulic models. However, there are uncertainties for the application of different correlations. This paper intends to show the effects and importance of a number of correlations for wall friction, interphase drag, and virtual mass. It has been shown that the homogeneous wall shear model yields good results up to the annular flow regime, the single-bubble drag correlation is acceptable, and the inclusion of virtual mass coefficient is helpful. It has been found that the critical Weber number is not appropriate for bubble radius calculation; it predicts an opposing tendency when compared with the test data. Also, a two-phase diffuser efficiency is required for diverging ducts and a correlation for the same has been proposed. (24 refs.)

47.55M Flow through porous media

113498 A stability model for steam generators. A.Duyar (Dept. of Mech. Engrg., Florida Atlantic Univ., Boca Raton, FL, USA), R.J.Gross.

Math. Modelling (USA), vol.4, no.1, p.41-59 (1983).

A mathematical model to analyze the stability of the two-phase flow in a generalized steam generator is developed. A counter flow heat exchanger in which a high temperature primary fluid heats and vaporizes a lower temperature secondary fluid is considered as the system. The governing equations of this system is obtained by using the transient field equations, constitutive relations, boundary conditions and the initial conditions of both the primary and the secondary fluids. The governing equations of the secondary fluid are decoupled from the equations of the primary fluid by determining a heat flux profile and superimposing it on the wall of the channel of the secondary fluid. With this superimposed heat flux profile an equivalent system is obtained which utilizes the fundamental equations of the secondary fluid to analyze the stability of the flow. To investigate the stability of the system, a relation between the variation of the inlet velocity and the variation of the total channel pressure drop is needed. The Laplace transform of this relation is called the transfer function of this system and is obtained by using a small perturbation technique and linearization. Liapunov's theorem is used to investigate the stability of the nonlinear system from linearized system. The theoretical predictions of this model are observed to be in agreement with experimental results. (10 refs.)

113499 Solid particle mixing in a continuously operated fluidized bed reactor. K.Wittmann, D.Wipperm (Inst. fur Tech. Chem., Univ. Hannover, Hannover, Germany), H.Schlingmann, H.Helmrich, K.Schugerl.

Chem. Eng. Sci. (GB), vol.38, no.9, p.1391-7 (1983).

In a bench-scale fluidized bed reactor, 20 cm in dia., residence time distribution of solid particles ($d_p = 137 \mu\text{m}$) were measured by the radionuclide technique ($^{24}\text{Na}_2\text{CO}_3$) in the absence and in the presence of the chemical reaction $2\text{NaHCO}_3 \rightarrow \text{Na}_2\text{CO}_3 + \text{CO}_2 + \text{H}_2\text{O}$. The residence time distributions were evaluated by a backflow cascade model by nonlinear optimization. The radial and longitudinal concentration profiles of NaHCO_3 in the emulsion phase of the reactor were measured during steady-state operation. The solid is well-mixed. The connection of the measured bubble properties with the longitudinal solid dispersion coefficient and the use of the Haines-King-Woodburn model (1972) allows one to calculate the solid dispersion coefficient in the bubble-free emulsion phase. (19 refs.)

113500 Effect of shape factor and solid concentration on electrical conductivities of fluidized beds. P.Dakshinamurthy, C.V.Ramachandramurthy, V.Subrahmanyam, K.S.Rajanandam (Dept. of Chem. Engrg., Andhra Univ., Waltair, India).

Indian J. Technol., vol.21, no.1, p.37-8 (Jan. 1983). [received: Sept. 1983]

The dependence of electrical conductivities of two-phase fluidized beds on solid concentration and particle shape factor is established. The electrical conductivities of liquid fluidized beds with salt water as the continuous medium and particles of different sizes and shapes covering a range of shape factor 0.54-1.0 and solid concentration 0.05 to that of packed bed were measured. The data are correlated by the equation: $\epsilon_s = (0.59 + 0.41\psi_s)(1 - \alpha)$. (11 refs.)

113501 Flow of a viscous fluid through a porous medium bounded by a vertical surface. A.Raptis, C.Perdikis (Dept. of Mech., Univ. of Ioannina, Ioannina, Greece).

Int. J. Eng. Sci. (GB), vol.21, no.11, p.1327-30 (1983).

Unsteady free convection flow of a viscous fluid through a porous medium bounded by a vertical porous infinite surface is presented. Analytical expressions for the velocity and temperature fields are obtained when the temperature of the fluid and the temperature away from the surface have a difference which varies as some power of time. Also the velocity profiles are shown graphically for different values of the permeability parameter. (6 refs.)

(for biological fluid dynamics, see 87.45)

113502 Unsteady flow in branched pipeline systems. B.F.Glikman.

Power Eng. (J. Acad. Sci. USSR) (USA), vol.21, no.1, p.83-92 (1983). Translation of: **Izv. Akad. Nauk SSSR Energ. & Transp.,** vol.21, no.1, p.88-99 (1983).

The problem of formation of a linear mathematical model for a branched pipeline system with distributed parameters is considered. The matrix topology of circuit theory is used to develop a technique for formalized construction of the transfer functions of pipeline systems made up of passive and active elements and containing elements with both distributed and lumped parameters. An example is given of the formation of a mathematical model for a branched (ramified) pipeline system containing elements with distributed parameters. (4 refs.)

113503 Experimental investigations on the rewetting of hot horizontal annular channels. V.V.Raj (Reactor Engng. Div., Bhabha Atomic Res. Centre, Bombay, India).

Int. Commun. Heat & Mass Transfer (GB), vol.10, no.4, p.299-311 (July-Aug. 1983).

Deals with experimental investigations on the rewetting of hot horizontal annular channels. Experiments have been carried out, at atmospheric pressure, on a stainless steel test section. The temperature of the inner surface of the annular channel was varied from 200 to 500°C and the flow rate from about 0.7 kg/min. to 9.5f kg/min. These experiments indicate that stratification effects are significant, more so at lower flows. The rewetting front is included. The rewetting velocity increases as the flow rate is increased and decreases as the initial wall temperature is increased. (3 refs.)

113504 Drag coefficients of a sphere and a bed of spherical elements. A.R.Khenven, D.M.Lyakhov.

High Temp. (USA), vol.20, no.6, p.886-90 (Nov.-Dec. 1982). Translation of: **Teplofiz. Vys. Temp. (USSR),** vol.20, no.6, p.1119-23 (Nov.-Dec. 1982). [received: Sept. 1983]

A nonlinear model of the relation between the drag coefficient and the Reynolds number is used to obtain expressions connecting the drag coefficients of a sphere and a bed of spherical elements with the Reynolds number in a wide range of the latter. (7 refs.)

113505 Calculation of transient heat transfer in channels with Neumann boundary conditions. A.A.Ryadno (Dnepropetrovsk State Univ., Ukrainian SSR).

High Temp. (USA), vol.20, no.6, p.890-6 (Nov.-Dec. 1982). Translation of: **Teplofiz. Vys. Temp. (USSR),** vol.20, no.6, p.1124-30 (Nov.-Dec. 1982). [received: Sept. 1983]

An algorithm is developed for the solution of transient boundary-value problems in convective heat transfer with specific application to the case of longitudinal laminar flow of an incompressible fluid past a bundle of rods. (7 refs.)

113506 Flow in an open channel bend with permeable bed. M.N.Channabasappa, K.G.Umapathy, I.V.Nayak (Dept. of Maths., Karnataka Regional Engng. Coll., Srinivasnagar, India).

Indian J. Technol., vol.21, no.2, p.49-52 (Feb. 1983). [received: Sept. 1983]

The flow of viscous fluid in an open channel bend with a non-erodible permeable bed is considered. Using the slip boundary condition at the nominal surface proposed by Beavers and Joseph (1967), the authors obtain expressions for velocity components and the free surface profile. It is seen that the effect of the permeability of the bed is to increase the velocity components and the super-elevation. (4 refs.)

113507 Effects of axial conduction in laminar tube flow with convective boundaries. B.Vick (Mech. Engrg. Dept., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA), M.N.Ozisik, D.F.Ullrich.

J. Franklin Inst. (USA), vol.316, no.2, p.159-73 (Aug. 1983).

Heat transfer in laminar tube flow with convective boundary conditions and axial heat conduction in the fluid is solved exactly. The effects of the external Biot numbers and the axial conduction in fluid on the temperature distribution and the local Nusselt number are determined for both the upstream and the downstream regions. In order to illustrate the effects of velocity profile, the results for the slug flow and the parabolic velocity profiles are plotted simultaneously. The heat transfer characteristics of the flow are found to be rather sensitive to the Peclet number, the external Biot numbers and the velocity profile in the thermal entrance region. (37 refs.)

113508 Generalization of experimental data of hydraulic friction, inside helically corrugated tubes. P.A.Savel'ev, Yu.S.Voskresenskii.

Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.4, p.79-85 (1983). In Russian.

The authors have made an analysis of geometrical ratios of helically corrugated tubes on hydraulic friction. A new generally geometric parameter h/D_e has been proposed with resulting formulae for calculating hydraulic friction. Here h is the height of the spiral projections, D_e diameter of the helical curve lying on the face of the supposed cylinder with the diameter d_e . The offered formulae approximate experimental results of various investigators, error maximum being 10.8%. In the region of Reynold's number from 1×10^4 to 5×10^4 for tubes with the height of helical projections $0.1 < h/d < 0.3$, where d is diameter of the smooth portion within the tube. (20 refs.)

113509 Current structure of channel flows according to the mean velocity distribution in the channel cross section. O.N.Me'n'nikova, Yu.G.Pyrkin (Dept. of Phys. of Sea & Inland Water, Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.114-17 (1982). Translation of: **Vestn. Mosk. Univ. Ser. 3 (USSR),** vol.37, no.5, p.97-9 (1982).

Riparian autonomous currents are investigated in channel flow, and the force field is determined from the isotach distribution in the flow cross section. The criteria determining the flow parameters at which riparian autonomous currents arise are discussed. (3 refs.)

47.65 MAGNETOHYDRODYNAMICS AND ELECTROHYDRODYNAMICS

(for MHD in plasma, see 52.30)

113510 Magnetohydrodynamic free convective effect for an incompressible viscous fluid past an infinite limiting surface. A.Raptis, G.Tzivanidis (Dept. of Mech., Univ. of Ioannina, Ioannina, Greece).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.311-17 (Aug. 1983).
 An analysis of the effect of a magnetic field on the free convective flow of an incompressible, electrically conducting and viscous fluid past at infinite vertical limiting surface, has been carried out. The limiting surface does not move, there is a constant heat flux at the limiting surface, the free velocity is constant and the magnetic Reynolds number is not small. The effects of the magnetic parameter and the Grashoff number on the flow are discussed. (6 refs.)

113511 Growth and decay of sonic discontinuities in nonequilibrium magnetogasdynamics. B.G.Verma, R.C.Srivastava, A.H.Khan (Dept. of Math., Gorakhpur Univ., Gorakhpur, India).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.361-9 (Aug. 1983).
 The phenomenon associated with sonic discontinuities in nonequilibrium magnetogasdynamics is studied by the use of singular surface theory. The fundamental differential equations for growth and decay of sonic discontinuities are formulated. This class of equations is solved completely and for plane case in particular. The critical time at which a sonic wave terminates in the shock waves is also obtained. (8 refs.)

113512 Heat and mass transfer of an oscillatory flow with Hall current. H.L.Agrawal, P.C.Ram, V.Singh (Dept. of Appl. Math., Banaras Hindu Univ., Varanasi, India).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.383-93 (Aug. 1983).
 Analyzes the effect of a Hall current on the thermal and mass diffusion of an electrically conducting liquid past an infinite vertical porous plate. Analytical expressions for the transient velocity, the transient temperature in the boundary layer and the skin-friction on the plate are derived. The defects of various parameters on the velocity, temperature, shearing stresses and rate of heat transfer are shown. (5 refs.)

113513 Finite difference analysis of MHD free-convection flow past an accelerated vertical porous plate. A.K.Singh (Dept. of Math., Banaras Hindu Univ., Varanasi, India).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.395-400 (Aug. 1983).
 The effect of a uniform transverse magnetic field on the free-convection flow of an electrically conducting fluid past a uniformly accelerated infinite vertical porous plate is discussed. A finite-difference method is used to obtain the solution of the governing equations when the Prandtl number is not equal to unity. The velocity profiles are shown graphically for both cooling and heating of the porous plate. The numerical values of the skin-friction are entered in table and the effects of the various parameter on the flow field are discussed. (5 refs.)

113514 On the analysis of MHD flow of a two-component gas and its application. Rong Sheng (Inst. of Mech., Acad. Sinica, Peking, China).

Acta Mech. Sin. (China), no.3, p.293-7 (1983). In Chinese.
 The MHD flow of a two-component gas under the action of an axial magnetic and radial electric field is studied. The distributions of rotational velocity, temperature, concentration and separation coefficient of isotopes Ne^{20} and Ne^{22} in an electromagnetic separator are given. (3 refs.)

113515 MHD free convection flow past an accelerated vertical plate. A.Raptis (Dept. of Mech., Univ. Ioannina, Ioannina, Greece), A.K.Singh.

Int. Commun. Heat & Mass Transfer (GB), vol.10, no.4, p.313-21 (July-Aug. 1983).
 The effect of a uniform transverse magnetic field on the free convection flow of an electrically conducting fluid past an infinite vertical plate for both the classes of impulsive as well as uniformly accelerated motion of the plate is discussed. In this analysis, the magnetic lines of force are assumed to be fixed relative to the plate. Laplace transform technique has been used to obtain the expressions for the velocity field and skin-friction for both cases. It is found that the effect of the magnetic field is to increase the velocity field in both cases. (4 refs.)

113516 On kinematic properties of hydromagnetic fluid flows. G.Purushotham (Dept. of Math., Jawaharlal Nehru Technol. Univ., Nagarjunasagar Engng. Coll., Hyderabad, India).

Proc. Natl. Acad. Sci. India Sect. A, vol.52, pt.2, p.131-40 (1982). [received: Aug. 1983]

The nonlinear character of the differential equations governing fluid-dynamic problems has presented enormous mathematical difficulties to find out exact possible flows. Consequently many interesting methods (inverse and semi-inverse) have been introduced, to study the kinematic and the kinetic properties of the flows. The introduction of the geometric theory of curves and surfaces in fluid flow theory is also one such method, which received considerable attention of the investigators in recent years, and presents the possible flows. Extending this concept to the hydromagnetic fluid flows, in which the field is assigned unidirectional and introducing triply orthogonal spatial curves of congruences C^3 in Euclidean space E^3 , related to the streamline, various kinematic properties of the flows are examined. (9 refs.)

113517 Noncanonical Hamiltonian formulation of ideal magnetohydrodynamics. D.D.Holm, B.A.Kupershmidt (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.330-3 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

A noncanonical Poisson structure for ideal magnetohydrodynamics is presented and identified with a differential Lie algebra. (10 refs.)

113518 Magnetic tornadoes: three-dimensional affine motions in ideal magnetohydrodynamics. D.D.Holm (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Physica D (Netherlands), vol.8D, no.1-2, p.170-82 (July 1983).

From Hamilton's principle and a factorization Ansatz the author derives a class of exact solutions for three-dimensional motion in ideal, compressible MHD. These exact nonlinear solutions are motions generated by time-dependent affine transformations, under which the fluid rotates, circulates and deforms. They reduce to three-dimensional self-similar solutions when rotation is absent. Continuous symmetries of Hamilton's principle for the affine MHD motions generate various constants of motion. Discrete symmetries establish duality relations among classes of solutions. In a special case, rotational and

circulatory MHD motion is expressed as classical mechanical motion upon its own symmetry group, the Lie group $O(4)$, in the well-known Arnold-Lax-Euler commutator form, $M = [\omega, M]$. (20 refs.)

113519 Unsteady magnetohydrodynamic Couette flow. A.K.Singh, N.Kumar (Dept. of Math., Banaras Hindu Univ., Varanasi, India).

Wear (Switzerland), vol.89, no.2, p.125-9 (15 Aug. 1983).
 The effect of a uniform transverse magnetic field on the Couette flow of an electrically conducting fluid between two parallel plates for impulsive and uniformly accelerated motion of one of the plates is discussed. The magnetic lines of force are assumed to be fixed relative to the moving plate. The Laplace transform technique has been used to obtain the expressions for the velocity field and skin friction. The effect of the magnetic field is to increase the velocity field in both cases. (3 refs.)

47.70 REACTIVE, RADIATIVE, OR NONEQUILIBRIUM FLOWS

113520 An approximate solution for diffusion and reaction in a non-ideal tubular reactor. K.M.Nigam, K.D.P.Nigam, V.K.Srivastava (Dept. of Chem. Engng., Indian Inst. of Technol., New Delhi, India).

Int. Commun. Heat & Mass Transfer (GB), vol.10, no.4, p.341-8 (July-Aug. 1983).

An analytical solution for diffusion with homogeneous first order chemical reaction in laminar flow of a Newtonian fluid through tubular reactor is presented within the framework of Taylor's dispersion theory. The novelty about the work is the Galerkin's technique has been used for the first time to obtain the expression for the effective dispersion coefficient. (18 refs.)

113521 A Eulerian-Lagrangian model for turbulent combustion. R.Borghi, E.Pourbaix (ONERA, Chatillon, France).

Rech. Aerosp. (France), no.4, p.245-55 (July-Aug. 1983). In French.
 For predicting reactive flows in turbomachine combustion chambers, both turbulence and combustion (usually represented by a set of chemical reactions involving several species) must be taken into account simultaneously. When this is done, the classical Eulerian models, using the probability density function (PDF) of mass fractions and temperature become doubtful or impossible to solve numerically. However, the use of 'Lagrangian models in the phase space', makes it possible to define a sort of sketch on the PDF, even in the case of a multidimensional PDF. A simple integration along this sketch then provides all the mean characteristic values, at each point of the flow field. (18 refs.)

47.80 INSTRUMENTATION FOR FLUID DYNAMICS

113522 Hybrid processing for phase measurement in metrology and flow diagnostics. I.Prikryl, C.M.Vest (Dept. of Mech. Engng. & Appl. Mech., Univ. of Michigan, Ann Arbor, MI, USA).

Appl. Opt. (USA), vol.22, no.18, p.2844-9 (15 Sept. 1983).
 A hybrid optical/digital processing scheme for measuring phase distributions is described and demonstrated. It is intended to be an alternative to interferometric methods of measuring optical path length changes in flow diagnostics and can also be used as a flow visualization technique. The processing scheme enables one to make accurate measurements of phase at arbitrary points in the image plane. The system is based on a simple coherent optical Fourier processor but incorporates three separate measurements and postdetection digital processing to eliminate extraneous parts of the signal. The addition of a holographic filter to the system enables one to measure deformation or displacement of diffusely reflecting opaque objects. The technique is demonstrated by using it to visualize the flow of an expanding compressible gas jet and to measure the optical path length through a heated plume of air. (11 refs.)

113523 An experimental and analytical investigation of the particle loss mechanism in a circular flow for laser anemometry. H.Bessling (Inst. fur Entwurfsaerodynamik, DFVLR, Braunschweig, Germany).

Atomkernenerg. Kerntechnik (Germany), vol.42, no.2, p.111-16 (1983). In German.
 Investigations by laser anemometry in wind tunnels concerning the construction of airfoils or blades of turbines require light scattering particles of definite particle number concentration and particle size distribution in the test volume. Particle analysis was performed by addition of aerosol in order to reach the standard values. A simplified model conception also applicable for other devices with circular flow was developed for the particle loss mechanism. The comparison of calculated and experimentally estimated data are satisfactory in considering the magnitude of errors by aerosol measurement. (16 refs.)

113524 Fluid flow control for the intermittent extended aeration process. R.Olavarria, V.H.Pham, G.Malvicini.

Process Eng. (Australia), vol.11, no.3, p.27, 29 (March 1983).
 Intermittent extended aeration processes are being more and more frequently used by the relevant authorities to treat both municipal and industrial waste water. Inherent in this process is the fact that while the inflow of waste water can occur throughout the entire cycle, the withdrawal of the effluent is on an intermittent basis. The process is characterized by low F/M ratio in a normal operation and a very slow rate of sludge formation. (3 refs.)

113525 X-ray visualisation of high speed phenomena: application to the behavior of materials under high explosives loading. A.Hauducoeur, J.Fischer, R.Guix (CEA-Vaujours, Sevran, France).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.60-5 (1983). In French. 1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

Flash Radiography and Cineradiography allow the visualisation of high speed phenomena and the stop-motion effect with recording on film of qualitative and quantitative data on the dynamic state of the matter under very intense shock waves. The authors present a set of experimental devices and results obtained with a large range of flash X-ray generators, i.e. small generators made with Marx discharge circuits coupled to void X-ray tubes, working up to 2.5 MV and a big flash machine, GREC used with very absorbing materials. The applications illustrate a large field of experiments in the field of shock waves, interaction of 2 shock or detonation waves, flow visualisation of detonation, Taylor instabilities, metal jetting, spalling in iron, etc. (1 ref.)

113526 Comparison of photon correlation laser Doppler anemometry data processing techniques. R.G.Brown (Royal Signals & Radar Estab., Malvern, England), M.E.Gill.

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.220-8 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

The truncated and statistical nature of photon correlation functions obtained from laser Doppler anemometry experiments and the ill-conditioned problem of their inversion, has led to a wide variety of approaches to the extraction of reliable information from the data. The authors have performed direct experimental comparisons (using identical data) of the four widely used methods of data reduction, ranging from simple to highly sophisticated. The authors comparisons covered most forms of correlogram likely to be encountered experimentally and the authors draw conclusions on the practicability, limitations and error magnitudes of current techniques. (12 refs.)

113527 A method for liquid velocity measurement by using two interdigital transducers. H.Urabe, K.Toda (Dept. of Electrical Engng., Nat. Defense Acad., Yokosuka, Japan).

Ferroelectr. Lett. Sect. (GB), vol.1, no.1, p.1-5 (1983).

A technique using a liquid delay line oscillator is presented for measuring the liquid velocity. The key element of the delay line oscillator is two interdigital transducers operating at a liquid-solid interface, which are used for the radiation or the detection of the longitudinal wave in the liquid. The oscillation frequency of the device changes with the liquid velocity. The validity of the operation principle is verified experimentally for the water velocity change. (2 refs.)

113528 Procedure for measuring the thickness and wave characteristics of the surface of the liquid film in annular-mist flows of steam and water. B.I.Nigmatulin, A.A.Vinogradov, V.A.Vinogradov, Sh.E.Kurbanov.

High Temp. (USA), vol.20, no.6, p.910-17 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1145-52 (Nov.-Dec. 1982). [received: Sept. 1983]

A procedure and equipment have been developed for measuring in real time the thickness of the liquid wall film in annular steam-water flow at pressures up to 12 MPa. The construction of the film-thickness sensor unit and schematic diagrams of the arrangement for measuring the liquid film thickness and the experimental section are given, along with their principles of operation. The results of measurements of the liquid film thickness and the velocities of the wave crests and troughs of the disturbed phase interface are given, and the variation of the interface profile as a function of the regime parameters of the steam-water flow is described. (11 refs.)

113529 A two-component optomechanical speed transducer for use with turbulent flows of liquid metal. V.G.Zhilin, Yu.P.Ivochkin, V.P.Ogorodnikov, V.V.Osipov (High-Temperature Inst., Acad. of Sci., USSR).

High Temp. (USA), vol.20, no.6, p.926-9 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1164-8 (Nov.-Dec. 1982). [received: Sept. 1983]

An optomechanical speed transducer is described for use with turbulent flows of liquid metal. The structural scheme is examined and calibration results obtained with mercury are given for a unit in which the sensitive element has a diameter of about 50 μm and an effective length of about 1.5 μm . The dynamic characteristics are evaluated. (9 refs.)

113530 Characteristics of a film-type heat-flux transducer. Yu.A.Polyakov, S.A.Degtyarev, A.V.Klygin (Higher Fire Service Engng. School, Min. of Higher Education, USSR).

High Temp. (USA), vol.20, no.6, p.930-6 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1169-75 (Nov.-Dec. 1982). [received: Sept. 1983]

A theoretical study is presented of the dynamic characteristics of a film-type transducer with a thin protective layer. Studies have been made of the insulation heating time and the temperature delay. The effects of the coating and substrate materials on the time characteristics are examined. Estimates have been made of the coating heating time and temperature delay for a particular transducer. It is found to be desirable to choose a substrate of low thermal conductivity for a threshold transducer. The conclusions are illustrated from experiments with pulsed radiation. (3 refs.)

113531 Adjustable isokinetic sampling horn. S.E.Spedden (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.26, no.2, p.853-5 (July 1983).

The author describes the design of an adjustable sampling horn for use with optical particle counters to allow for isokinetic sampling of aerosols in laminar gas flow environments of differing velocities. (no refs.)

113532 Ultrasonic flow metering based on transit time differentials which are insensitive to flow profile. H.Lechner (LGZ Landis & Gyr Zug AG, Zug, Switzerland).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.955-9 (Sept. 1983).

This paper describes a theoretical study of the performance of a transit time ultrasonic flowmeter which uses a flow tube to contain the interaction between the flow and the ultrasonic wave field. The flow tube is treated as an acoustic waveguide and it is seen that the transit time differentials of the higher order acoustic modes are affected by the type of flow profile encountered, resulting in errors in the volume throughput measurement. Nevertheless these errors can be minimized by an appropriate choice of transducer separation. (4 refs.)

113533 A simple, cost-effective automatic capillary viscometer system. M.Breton, D.Gustafson (Xerox Res. Centre of Canada, Mississauga, Ontario, Canada).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1559-62 (Aug. 1983).

The interfacing of an Ubbelohde-type capillary viscometer to a microprocessor controller such as the AIM-65 gives the polymer chemist a convenient, precise and reliable way to measure the viscosity of solvent and polymer solutions. One of the first applications of a low-cost microprocessor to the measurement

of viscosity is reported here. Reproducible, high-precision data, the statistical nature of the results generated by the instrument, and the flexibility of the software strategy are important characteristics of the system. (4 refs.)

113534 Vortex flowmetering. C.Floria, T.K.Matsuura (Yokogawa Corp. of America, Shenandoah, GA, USA).

J. A (Belgium), vol.24, no.3, p.149-53 (July 1983).

This article describes the characteristics of vortex flowmeters and explains the advantages to be gained from their use. The problems encountered in the design of flowmeters are examined with particular emphasis on the stress sensing system. (no refs.)

113535 A new rheometer with autoranging function, controlled by a micro-computer. K.Takahashi, S.Yokoyama (Dept. of Electronic Engng., Shibaura Inst. of Technol., Tokyo, Japan), H.Fujihira, N.Hirose.

Oyo Buturi (Japan), vol.52, no.7, p.607-13 (July 1983). In Japanese.

A new rheometer, which can measure a wide range of viscosity by automatically adjusting the arm length and balancing force in detecting the torque by the rotary cylinder method was developed with the use of a micro-computer. The measurement can be conveniently made by interaction with the micro-computer through a console. (3 refs.)

113536 Movable channel flowmeter. K.Shiba, T.Ichinose, J.Kitamura, R.Kobayashi (Faculty of Engng., Tokyo Univ., Kawagoe, Japan).

Oyo Buturi (Japan), vol.52, no.7, p.614-18 (July 1983). In Japanese.

The movable channel flowmeter reported is a device of a very simple construction for measuring flow rate in an open channel. The measuring principle of this flowmeter is based on the law of conservation of momentum or angular momentum similarly to the movable tube flowmeter. It has been found from the results of experiments that the L bend flowmeter of two measured quantities type is better than the straight flowmeter. (no refs.)

113537 Present developmental trends in flow measurement technology.

H.Umbach (BASF AG, Ludwigshafen am Rhein, Germany).

Regelungstech. Prax. (Germany), vol.25, no.6, p.225-8 (June 1983). In German.

Surveys the latest techniques and the potentialities of microelectronics in flow measurement and discusses the application of materials and physical effects which have not up to the present time been effectively exploited. In particular, the magnetic-inductive flowmeter using a switched unidirectional field is discussed in detail and some examples of compact instruments based on this principle are described and illustrated by photos. This includes an illustration of a flowmeter using a measuring tube of sintered corundum. Some examples of meters, using the Karmans wake effect, which have overcome the difficulties of recognizing the turbulence under all operating conditions by the use of two independent sensors and computerized evaluation are given. Finally, an example of a meter which utilizes the Coriolis force by passing the fluid through a U-tube and measuring the angle of torsion which is proportional to the mass flow, is described. (1 ref.) L.M.W.

113538 The practical calibration of water flowmeters under realistic temperature conditions. C.Meisser (LGZ Landis & Gyr AG, Zug, Switzerland).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.299-307 vol.2

With the displacement prover, flowmeters can be tested automatically within the entire temperature range without a comparison standard. The WPV 2-180 was designed for a T_{max} of 120°C and a P_{max} of 16 bar. The flow extends from 10 l/h to 18000 l/h. For flow rates over 100 l/h the errors remain smaller than $\pm 0.2\%$. For lower flow rates and temperatures above 60°C the cooling within the meters to be calibrated must be taken into consideration. (4 refs.)

113539 Flowmetering in a long-distance pipeline grid for ethylene under high pressure. P.J.Orbons, F.A.Van Laak (DSM Transportmaatschappij, Beek, Netherlands).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.541-50 vol.2

Deals with a new metering system which has become necessary by the change-over of an ethylene pipeline to supercritical operation, with measures for maintaining and improving the accuracy, with the recording of the measuring data and with the new leak detection facilities. (no refs.)

113540 A new primary rig for accurate flowmeter calibration. C.Cignolo, F.Alasia, R.Goria, G.Martini, A.Rivetti (Istituto di Metrologia 'G. Colonetti', Torino, Italy).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.551-62 vol.2

Describes a primary calibration rig built at the IMGC flow measurement laboratory, in which flow rates of several types of liquids can be measured from about 0.05 up to 200 l/min over wide temperature and pressure ranges. The aim was to obtain maximum uniformity in flow conditions, as well as the highest accuracy and versatility. In the description of the apparatus emphasis is given to a rectangular variable-area nozzle and to a new ballistic diverter, with which flow diversion can take place in an extremely short time (approx. 2 ms), so that substantial reduction in timing uncertainty can be obtained. (4 refs.)

113541 High speed motion neutron radiography of two-phase flow.

A.H.Robinson, S.L.Wang (Oregon State Univ., Corvallis, OR, USA).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.653-9

A system to perform neutron radiographic analysis of dynamic events which occur on the order of several milliseconds has been developed. Two different methods have been used to radiograph the simulated two-phase flow. These are pulsed, or 'flash' radiography, and high speed movie neutron radiography. The pulsed method serves as a 'snapshot' with an exposure time ranging from 10 to 20 milliseconds. In high speed movie radiography, a scintillator is used to convert neutrons into light which is enhanced by an optical intensifier and then photographed by a high speed camera. The results obtained demonstrate the feasibility of using neutron radiography to obtain data in two-phase flow situations. Both movies and flash radiographs have been obtained of air bubbles in water and boiling from a heater element. The neutron radiographs of the boiling element show both nucleate boiling and film boiling. (no refs.)

50.00 FLUIDS, PLASMAS AND ELECTRIC DISCHARGES

(for fluid dynamics, see 47.; for the physics of condensed matter, see 60. and 70.)

51.00 KINETIC AND TRANSPORT THEORY OF FLUIDS; PHYSICAL PROPERTIES OF GASES

51.10 KINETIC AND TRANSPORT THEORY

113542 Kinetic perturbation theory. Structure of collision integrals for the square-well gas. J.Karkheck (Dept. of Sci. & Math., GMI Engng. & Management Inst., Flint, MI, USA), G.Stell. *J. Phys. Chem. (USA)*, vol.87, no.15, p.2858-66 (21 July 1983). The authors seek a better understanding of the structure of kinetic perturbation theory, in inverse temperature T^{-1} , for fluids. For a prototypic pair potential (hard core of unit diameter plus square well of width R and depth ϵ) they obtain exact results on the Boltzmann-equation level of description. The authors find the following: (i) For the self-diffusion collision integral $\Omega^{(1,1)}$, the nonanalytic terms in $w = \epsilon/kT$ are all of the form $w^n \ln w$ and $w^{n+1} \ln^2 w$, $n=2, 3, 4, \dots$ (ii) $\Omega^{(1,1)}$ also has an essential singularity in R at $R=1$. (iii) First-order perturbation theory in w is unreasonably accurate. It yields a good approximation for $\Omega^{(1,1)}$ (and hence for the coefficient of self-diffusion) over a considerable region of parameter space (R^{-1}, w), including domains over which individual higher order terms in w are larger than the first-order terms. (iv) Partial sums through $O(w^3 \ln w)$ yield approximations of decreasing accuracy as more terms are included. (v) A result similar to iii is found for the thermal conductivity and its collision integral, though over a more limited region of parameter space. (vi) The linear term in w and the leading nonanalytic terms are traced to different collision types. The significance of the above findings for perturbative treatments of the dense fluid is discussed. Results are presented also for the simpler cases of coreless square-well and repulsive (square) mound pair potentials. (36 refs.)

113543 An improved reduced Van der Waals equation of state for helium at high pressures. J.I.Benneth, W.A.Jesser (Materials Sci. Dept., Univ. of Virginia, Charlottesville, VA, USA). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.339-42 (June 1983). Equations of state (EOS) for helium are examined. Of all the EOS investigated, the hard sphere EOS reproduced the experimental data the best, followed by the virial EOS and the 'improved' reduced van der Waals EOS. The ease of computation of these three EOS follows a reverse order, with the 'improved' reduced van der Waals EOS being the easiest by far and the hard sphere EOS the most difficult to calculate. At 600°C the virial EOS converged very rapidly to the most accurate hard sphere EOS, even at high pressures. The ratio of the number of helium atoms/vacancy for very small equilibrium bubbles as predicted by these three EOS is almost temperature independent. (16 refs.)

113544 The discrete Boltzmann equation for gas mixtures. A regular space model and a shock wave problem. N.Bellomo (Dept. of Math., Polytech. of Turin, Turin, Italy), L.M.de Socio. *Mech. Res. Commun. (GB)*, vol.10, no.4, p.233-8 (July-Aug. 1983). Reports on the construction of a discrete velocity model (DVM) for a multiple species gas mixture, a subject that has so far not been investigated. The general methodology is indicated and a regular 6.R velocity model is proposed for a R species gas, from which a system of 6.R partial differential equations is obtained for the fluid flow, as the velocity distribution function for each species is replaced by constant velocities. An application and a final discussion follow. (8 refs.)

113545 Kinetic equation for a spontaneously dissociating gas. V.K.Ablekov, Yu.N.Babaev, A.M.Frolov. *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1013-15 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1089-93 (Dec. 1982). [received: Sept. 1983] The dissociation process has been examined in gases of dissociating particles in the case when collisions of gas particles cause the disintegration of one of the particles as a result of breaking of the bonds among its constituent particles by the incident particle. A bound state of two particles comprising the gas particle is the most widely used model for analyzing the inelastic processes of dissociation or synthesis of the gas particles, such as ionization in weakly-ionized plasmas or in chemically reacting gases. The authors attempt to construct kinetic equations describing the kinetic properties of gases consisting of spontaneously dissociating particles by including terms for this type of decay in the equations. (14 refs.)

113546 The hard-sphere model in plasma and gas physics. B.M.Smirnov (L.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR). *Sov. Phys.-Usp. (USA)*, vol.25, no.11, p.854-62 (Nov. 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.138, no.3, p.517-33 (Nov. 1982). [received: Sept. 1983] Expressions are derived for the scattering cross sections and the macroscopic properties of gases and plasmas in a hard-sphere model in which the first two terms are retained in the expansion in the small parameter of the theory. These expressions are analyzed and compared with the results of the Maxwell model and also with numerical calculations for model interaction potentials. (20 refs.)

- 113547 Some remarks on the theory of local interaction in a rarefied gas.** R.N.Moroshin. *Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR)*, no.3, p.51-7 (July 1983). In Russian. A new version of the theory of local interactions is presented. The form functions being determined by means of a recurrent system of differential equations. (15 refs.)

51.20 VISCOSITY AND DIFFUSION: EXPERIMENTAL

113548 Momentum implications for buoyant diffusion flames. B.J.McCaffrey (Center for Fire Res., NBS, Washington, DC, USA). *Combust. & Flame (USA)*, vol.52, no.2, p.149-67 (Sept. 1983). Using assumed Gaussian forms for the transverse variation of mean quantities and well-established centerline variations, the integrated form of the momentum equation is solved for the vertical variation of the radial extent of buoyant diffusion flames. Closure is obtained by assuming that the convective heat flux at the flame tip is equal to the total heat release rate minus the radiative fraction. Solutions are obtained in terms of λ , which is the ratio of the $1/e$ transverse widths of the thermal energy profile to that of the velocity profile, and a local, centerline Froude numberlike parameter, $C_B = U/\sqrt{2gz} \Delta T/T_0$. The parameters differentiate between initial buoyancy-dominated (necking-in) behaviour associated with solid or liquid pool flames versus momentum-dominated gas jet flame behavior. Recent data from porous refractory gas burners at flame conditions near the transition are compared to the simple analysis. Calculated transverse components of velocity compare favourably to Thomas's thistledown tracer experiments and provide the basis for an evaluation of the use of the boundary layer equations in pool fire modeling. Estimates of the effects of turbulence in the upper portion of the flame are presented. (21 refs.)

Vibrational energy relaxation of highly compressed gaseous H₂ and N₂ See Entry 112816

51.30 THERMAL PROPERTIES OF GASES

113549 The PVT properties of nitrogen from -20 to +35°C and 200 to 570 MPa, and some comparisons with argon and the Lennard-Jones (6-12) fluid. E.C.Morris, R.G.Wylie (CSIRO Div. of Appl. Phys., Sydney, Australia). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2982-8 (15 Sept. 1983). The density $\rho(T,p)$ of nitrogen has been measured for $T = -20$ to $+35^\circ\text{C}$ and p in the range 200 to 570 MPa, using a method already described in a paper which included results for argon. An improvement in the accuracy with which the quantities of gas are measured has reduced the overall uncertainty in $\rho(T,p)$ to 0.03% at the 95% confidence level. The results are presented graphically and in the form of a fitted equation, and are compared with those of other workers. A comparison is made with the results of the argon study and a hypothetical Lennard-Jones fluid, in terms of the density, the internal energy and the entropy, and the internal kinetic energy of the molecules as calculated by Schottky's method. (17 refs.)

113550 Low-density isochoric (p, V, T) measurements on (nitrogen+methane). W.M.Haynes, R.D.McCarty (Nat. Engng. Lab., NBS, Boulder, CO, USA). *J. Chem. Thermodyn. (GB)*, vol.15, no.9, p.815-19 (Sept. 1983). Isochoric (p, V, T) measurements have been made on three mixtures of nitrogen and methane (0.29N₂+0.71CH₄), (0.50N₂+0.50CH₄), and (0.68N₂+0.32CH₄) at densities of 1 to 6 mol.dm⁻³. The three isochores for each mixture cover a temperature range from approximately 150 to 320K up to a maximum pressure of 16 MPa. Comparisons with other experimental results and with values calculated from an extended corresponding-states model are discussed. (10 refs.)

113551 Diamond-anvil system for the investigation of phase equilibria in mixtures at high pressures. J.A.Schouten, N.J.Trappeniers, L.C.van den Bergh (Van der Waals Lab., Univ. of Amsterdam, Amsterdam, Netherlands). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1209-12 (Sept. 1983). In order to investigate the phase behavior of mixtures at high pressures the authors have developed a system consisting of a diamond-anvil cell with a high-pressure vessel to match. The diamond cell can be filled at room temperature and pressures up to 10 kbar with a gaseous mixture of known composition. The cell is constructed such that a constant volume method can be used to measure the dew- and bubble-point curves of a mixture. (8 refs.)

113552 Substance compressibility and 'gravitation effect' near the critical point. A.D.Alekhin. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.8, p.1261-3 (Aug. 1983). In Russian. Investigates substance compressibility using two methods simultaneously—light scattering and measuring the refractive index gradient. The substances studied were n-heptane and freon-113, C₂F₃Cl₃. 51.50 ELECTRICAL PHENOMENA IN GASES

(see also 52. Plasma and electric discharges)

113553 The local field inside a dielectric gas. F.Hynne (Chem. Lab. III, H.C. Orsted Inst., Copenhagen, Denmark). *Am. J. Phys. (USA)*, vol.51, no.9, p.837-42 (Sept. 1983). The Clausius-Mossotti relation is systematically in error for molecular gases. The dielectric constant is more adequately described in terms of an effective polarizability, which accounts for the interaction of a molecular dipole with

self through the surrounding molecules. These aspects of the local field problem of dielectric theory are discussed on the basis of a simple macroscopic model due to Onsager and Bottcher. The conclusions drawn from the model have been established by strictly microscopic arguments, however, and the authors briefly discuss the microscopic representations of the concepts used. (13 refs.)

13554 On the computation of ionization levels in rocket exhaust flames. M.Cousins, D.E.Jensen (Propellants, Explosives & Rocket Motor Establ., Min. of Defence, Aylesbury, England).

Combust. & Flame (USA), vol.52, no.2, p.111-25 (Sept. 1983). An up-to-date account of chemical processes determining electron concentrations in rocket exhaust flames is offered. Nonequilibrium charge production/removal reactions play important parts. So do electron attachment processes, formation of Cl^- and of OH^- being particularly significant in exhausts of motors with composite and double-base propellants, respectively. Uncertainties in various rate coefficients are among the sources of substantial possible errors in calculations of noise levels imposed on microwave guidance signals passing through the flames. (29 refs.)

13555 Spectroscopy of laser-induced dielectric breakdown in gas mixtures. A.H.Schwebel, A.M.Ronn (Dept. of Chem., City Univ. of New York, New York, NY, USA).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.178-82 (2 Sept. 1983). Laser-induced dielectric breakdown has been used to initiate fragmentation in molecular gases and gas mixtures. The emission spectra of the atoms, ions, and molecular fragments has been assigned and used to identify specific components of given mixtures. While this study only reports on mixtures of hydrocarbons and halogenated hydrocarbons, the technique is general and does not rely on laser absorption in any component of the mixtures. (9 refs.)

13556 Electrical conductivity of alkali metal vapors in the neighborhood of the critical point. A.A.Likal'ter (Inst. of High Temperatures, Acad. of Sci., USSR).

High Temp. (USA), vol.20, no.6, p.848-52 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1076-80 (Nov.-Dec. 1982). [received: Sept. 1983]

A strongly interacting alkali metal plasma in the neighborhood of the critical point is described in terms of quasiatoms with a continuous excitation spectrum. A phenomenological theory of the conductivity is constructed which agrees well with experimental data. (7 refs.)

13557 Dielectric constant of water at very high temperature and pressure. K.S.Pitzer (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

Proc. Natl. Acad. Sci. USA, vol.80, no.14, p.4575-6 (July 1983). Pertinent statistical mechanical theory is combined with the available measurements of the dielectric constant of water at high temperature and pressure to predict that property at still higher temperature. The dielectric constant is needed in connection with studies of electrolytes such as $\text{NaCl}/\text{H}_2\text{O}$ at very high temperature. (10 refs.)

13558 On the energy losses of slow ions in an interacting degenerate electron gas. Yu.S.Sayasov (Inst. fur Kernphysik II, Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany).

Z. Phys. A (Germany), vol.313, no.1-2, p.9-10 (1983). Energy losses of slow ions with velocities $v \ll v_F$ (v_F is the Fermi velocity) in an interacting degenerate electron gas are calculated on the basis of the dielectric theory of Singwi (1968). It is shown that the local field effects taken into account in this theory lead to an increase of the energy losses as compared with the Lindhard stopping power by a factor which can reach a few tens of percent for some compressed ICF plasmas. Corresponding factors for simple metals are as much as 2-3 and are in agreement with experiment. (10 refs.)

(for liquids, see 78.)

13559 Fire flame radiation. P.Vervisch, A.Coppalle (Lab. de Thermodynamique, Faculte des Sci. et des Tech. de Rouen, Mont-Saint-Aignan, France).

Combust. & Flame (USA), vol.52, no.2, p.127-35 (Sept. 1983). Measurements of intensity and transmittance in the spectral range 0.5-6 μm are reported for polypropylene in flaming or smoldering combustion. The influence of air velocity, radiant heat flux, and O_2 concentration is examined. A comparison between experimental results and band models is present. (10 refs.)

13560 Multilevel description of flow birefringence in binary mixtures of linear molecules with noble gases. W.-K.Liu, F.R.McCourt (Guelph-Waterloo Centre, Univ. of Waterloo, Waterloo, Ontario, Canada).

J. Phys. Chem. (USA), vol.87, no.15, p.2923-8 (21 July 1983). A multilevel description is given of the flow birefringence in a binary mixture of linear molecules and noble gases. The moment method is used in the derivation, and spherical tensors are used throughout. Exact expressions of the effective cross sections determining the flow birefringence coefficients are given explicitly. (31 refs.)

113561 Relativistic corrections for the conventional, classical Nyquist theorem. O.Theimer (Arts & Sci. Res. Center, New Mexico State Univ., Las Cruces, NM, USA), E.H.Dirk.

Nuovo Cimento B (Italy), vol.76B, ser.2, no.1, p.73-86 (11 July 1983). New expressions for the Nyquist theorem are derived under the condition in which the random thermal speed of electrons, in a system of charged and neutral particles, can approach the speed of light. Both the case in which the electrons have not net drift velocity relative to the ions or neutral particles and the case in which drift occurs are investigated. In both instances, the new expressions for the Nyquist theorem are found to contain relativistic correction terms; however, for electron temperatures $T \approx 10^4 \text{ K}$ and drift velocity magnitudes $|w| \approx 0.5 c$, where c is the speed of light, the effects of these correction terms are generally small. The derivation of these relativistic corrections is carried out by means of procedures developed in an earlier work (1982). A relativistic distribution function, which incorporates a constant drift velocity with a random thermal velocity for a given particle species, is developed. (11 refs.)

52.25 PLASMA BASIC PROPERTIES

113562 A far-infrared interferometer for the measurement of electron concentration in flames and plasmas with high spatial resolution. A.K.F.Chan, A.R.Jones (Dept. of Chem. Engng. & Chem. Technol., Imperial Coll. London, London, England).

Combust. & Flame (USA), vol.52, no.2, p.203-10 (Sept. 1983). A far-infrared interferometer employing an HCN laser has been designed which uses only simple, inexpensive optical components. It can operate either as a lateral shearing or Mach-Zehnder-type interferometer. Spatial resolution down to 0.5 mm is the test space was achieved. Good agreement was found with the theoretical resolution limit calculated from diffraction theory. The interferometer was used to measure electron densities in premixed flames with and without cesium seeding. The results confirmed the high electron concentration in the reaction zone of an unseeded methane-air flame. (16 refs.)

113563 Thermodynamic properties of ion clusters and their effect on the mechanism of homogeneous nucleation in an ion plasma. Calculation by the Monte Carlo method in an NpT ensemble. S.V.Shevkinov, P.N.Vorontsov-Vel'yaminov (A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).

High Temp. (USA), vol.20, no.6, p.803-9 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1025-31 (Nov.-Dec. 1982). [received: Sept. 1983]

The Monte Carlo method in an isothermal-isobaric ensemble is used to simulate the equilibrium thermodynamic properties of ion clusters. A region of thermodynamic stability of the ion chainlike nuclei toward folding up into a compact structure is discovered. It is shown that in this region of parameters the mechanism of homogeneous nucleation of the plasma differs qualitatively from the ordinary mechanism of nucleation through a critical nucleus, and the ion plasma cannot be supersaturated in this region. Previously discovered structural changes in a small ion system are discussed and a qualitative picture of the phase diagram is proposed. (23 refs.)

113564 Two-dimensional electron fluid at high temperature. C.Deutsch (Lab. de Phys. des Plasmas, Universite Paris XI, Orsay, France).

J. Stat. Phys. (USA), vol.32, no.1, p.115-22 (July 1983). The two-dimensional and one-component plasma (OCP) model with r^{-1} interactions is investigated in the high-temperature limit, where the thermal wavelength gets larger than the classical distance of closest approach. Non-negligible diffraction effects are rigorously taken care of (up to e^2) through a temperature-dependent effective interaction, Debye thermodynamics, analyzed in terms of a classical plasma parameter Λ , is shown to diverge as $\Lambda \ln \Lambda$, when $\hbar \rightarrow 0$. There is no classical limit. A result at variance with the corresponding one in three dimensions. (7 refs.)

113565 The self-consistent mean spherical approximation for the one-component plasma. D.MacGowan (Dept. of Math., Rutgers Univ., New Brunswick, NJ, USA).

J. Stat. Phys. (USA), vol.32, no.1, p.123-39 (July 1983).

The consequences of choosing the adjustable hard-core diameter in the mean spherical approximation for the one-component plasma so as to achieve thermodynamic consistency between the energy and compressibility equations are investigated. Such a choice is found to be possible only for $\Gamma \geq 8.5$ and, although the resulting correlation functions are discontinuous, the height of the main peak in the static structure factor is remarkably accurate. Two especially noteworthy aspects of the thermodynamic results are that the compressibility equation is much more accurate than in any previous approximation free of input from computer simulations and that the nonstatic part of the internal energy has a $\Gamma^{1/4}$ dependence in the strong coupling limit in agreement with Monte Carlo data. (33 refs.)

113566 Unified kinetic theory in toroidal systems. D.A.Hitchcock, R.D.Hazeltine, S.M.Mahajan (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA).

Phys. Fluids (USA), vol.26, no.9, p.2603-8 (Sept. 1983). A kinetic theory for toroidal systems which includes the effects of collisions as well as instabilities is constructed. This yields a pair of evolution equations; one for the spectrum and one for the distribution function. In addition, this theory yields a toroidal generalization of the usual collision operator which is

shown to have many similar properties, conservation laws, and H theorem, to the usual collision operator. (7 refs.)

113567 Plasma electron density measurements by the laser- and collision-induced fluorescence method. K.Tsuchida, S.Miyake, K.Kadota, J.Fujita (Inst. of Plasma Phys., Nagoya Univ., Chikusa-ku, Nagoya, Japan). *Plasma Phys. (GB)*, vol.25, no.9, p.991-9 (Sept. 1983).

A new method based on the laser-induced fluorescence method has been developed to measure the spatial electron density distribution in plasmas. The local electron density can be determined by observing the intensity ratio of the laser- to the collision-induced fluorescence. A spatial electron density distribution of a helium plasma ($T_e \sim 6$ eV, $n_e \cdot 10^{11-12}$ cm $^{-3}$) has been determined by observing the He($3^1P_{-2}^1S$) laser-induced fluorescence and the He($3^1D_{-2}^1P$) collision-induced fluorescence resulting from the He($3^1P_{-3}^1D$) process due to collisions with electrons. The comparison of the result with that of a conventional method proves this new method is of practical use in the space-resolved measurements of plasma electron density. (12 refs.)

113568 Existence of Debye screening in classical ion-dipole systems. A.L.Rebenko (Inst. of Theoretical Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1024-5 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1350-2 (Dec. 1982). [received: Sept. 1983]

The author generalizes the results of Brydges and Federbush (1980) to the case of ion-dipole systems. It is rigorously proved that if the density of ions is not zero then there is screening not only of the ion-dipole interactions but of the dipole-dipole interactions as well. (12 refs.)

113569 Thermodynamics of a highly compressed plasma in the megabar range. V.K.Gryaznov, I.L.Iosilevskii, V.E.Fortov (Inst. of Chem. Phys., Acad. of Sci., USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.592-3 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1378-81 (Nov. 1982). [received: Sept. 1983]

Works from experiments on the compression and irreversible heating of copper by intense shock waves to draw conclusions regarding the applicability of the ionizational ('gas') model of a plasma under rather unusual conditions for plasma physics: extremely high pressures, in the range of tens of millions of atmospheres, and densities n_e up to 10^{23} cm $^{-3}$. (11 refs.)

113570 Local determination of the ion temperature from the Doppler broadening of hydrogen lines through the use of a fast atomic beam. E.L.Berezovskii, M.M.Berezovskaya, A.B.Izvozhnikov, V.A.Kurpin.

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.594-5 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1382-6 (Nov. 1982). [received: Sept. 1983]

It is worth while to develop methods which can measure the temperature of the bulk of the plasma ions even if the distribution functions of certain groups of ions are non-Maxwellian. One such method is to measure the Doppler broadening of the emission lines of atoms of the working gas, which are excited during charge exchange between an injected beam of fast neutrals and ions of the working gas. The DINA-3 injector has been used as a diagnostic injector in the T-10 tokamak. In these measurements, this injector produced a beam of hydrogen atoms with an energy $E_0 = 20$ keV. For the spectral measurements, an MDR-2 monochromator was combined with a FEU-51 photomultiplier. (4 refs.)

52.25F Transport properties

113571 Nonresonant electron transport on the ELMO bumpy torus (EBT) for multitemperature Maxwellians. D.E.Hastings (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Phys. Fluids (USA), vol.26, no.9, p.2338-41 (Sept. 1983). For the experimental conditions in the ELMO Bumpy Torus (EBT), it appears that the electron distribution function may not be a single-temperature Maxwellian. Neoclassical transport coefficients have been developed for the nonresonant electron species in a bumpy torus with the assumption that the lowest-order distribution function is the sum of l different Maxwellians. These show that there can be significant coupling between the different electron species. For comparison the diffusion coefficients are contrasted to single-temperature diffusion coefficients. (6 refs.)

113572 Effect of collisionless detrapping on nonaxisymmetric transport in a stellarator with radial electric field. H.E.Mynick (Torsatron/Stellarator Lab., Univ. of Wisconsin, Madison, WI, USA).

Phys. Fluids (USA), vol.26, no.9, p.2609-15 (Sept. 1983). A derivation is given for expressions describing transport rates in a stellarator operating at low collisionality ν , in the presence of a radial electric field. It is shown that collisionless detrapping (and retrapping) of particles in superbanana orbits can substantially modify this transport. The detrapping provides a collisionless lower bound on the width of the collisional boundary layer which, in previous work, gave rise to transport coefficients scaling as $\nu^{1/2}$. With this lower bound, these coefficients will instead scale as ν , implying more favorable confinement than indicated by the $\nu^{1/2}$ result commonly employed. (7 refs.)

113573 Measurements of fluctuations in the flux of runaway electrons to the PLT Tokamak limiter. C.W.Barnes, J.D.Strachan (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).

Phys. Fluids (USA), vol.26, no.9, p.2668-75 (Sept. 1983). Fluctuations in the flux of runaway electrons to the limiter are measured during many PLT (Princeton Large torus) discharges. Oscillations at 60, 120 and 720 Hz are driven by variations in the vertical magnetic field which moves the plasma major radius. Fluctuations are seen with frequencies in the range of 2-20 kHz because of magnetohydrodynamic (MHD) magnetic islands which extend to the plasma surface. A continuous spectrum of fluctuations is observed up to 200 kHz which correlates with drift-wave turbulence. The magnitude of the driven fluctuations can be used to measure transport properties of the runaway electrons. The amplitude of electron motion due to the MHD and drift-wave oscillations, and hence a measure of the radial size of the instability, can be determined as a function of frequency. The slope of the frequency power spectrum of the drift-wave-induced fluctuations steepens with increasing runaway-electron drift orbit displacement during the current drop at the end of the discharge, and as the power in the MHD oscillations increases. A magnetic probe is used to confirm the presence of oscillating magnetic fields capable of perturbing the electron orbits. (18 refs.)

113574 Transport properties of drift waves. A.Rogister, G.Hasselberg, F.Waelbroeck.

Report JUL-1829, Kernforschungsanlage, Jülich, Germany (Feb. 1983), 10 pp.

The authors present the results and discuss the prospects of a study of plasma transport which is based on a recent theory of drift wave turbulence. The specific questions addressed are the turbulence spectrum, the electron heat conduction, the impurity transport, the evacuation of the power released during sawtooth relaxations, the cleaning action of these sawteeth, the cause of the high density limit and of the gross plasma disruptions. (9 refs.)

113575 Anomalous impurity transport in plasmas. A.Rogister, G.Hasselberg.

Report JUL-1846, Kernforschungsanlage, Jülich, Germany (March 1983), 30 pp.

The transport of high Z impurities resulting from Compton and induced scattering by drift waves is found to be comparable in magnitude with base ion and electron transport when the fluctuation spectrum is obtained from a recent theory of drift turbulence. The anomalous frictional flux is marginally subdominant whilst the diffusion flux is enhanced over the neoclassical value by a numerical factor which (i) agrees quantitatively with the results of impurity injection experiments, (ii) decreases with increasing base ion atomic mass, and (iii) is independent from the impurity charge to mass ratio. The theory further predicts a dramatic increase of the anomaly, also in agreement with experimental results, when the growth rate is enhanced within the heat pulse released by the sawtooth relaxations of the core. 2.25P Emission, absorption, and scattering of radiation

- 13576 Forward CW CO₂-laser scattering on a high density plasma column. J.L.Lachambre, R.Decoste, A.Robert, P.Noel (Inst. de Recherche Hydro-Quebec, Varennes, Quebec, Canada). *Appl. Phys. (USA)*, vol.54, no.9, p.4722-8 (Sept. 1983). Wave-number and frequency spectra $S(k, \omega)$ associated with spontaneous electrostatic fluctuations in a high-density ($5 \times 10^{21} \text{ m}^{-3}$) current-driven plasma are measured using forward CO₂-laser scattering with homodyne detection. Scattering measurements during the quiescent plateau phase of the discharge show fluctuation levels several orders of magnitude above the thermal level with k^{-4} and ω^{-2} spectral amplitude dependences. The fluctuations are found to be isotropic in a plane transverse to the magnetic axis with $\langle k_{\perp} \rangle \propto S(k_{\perp}, \omega)$. The scattering apparatus is also shown to be a valuable diagnostic tool for basic studies of plasma current transport across magnetic field lines. In fact, a clear correlation is observed between the appearance of strong fluctuations and the rapid current penetration during fast plasma current reversal experiments. Finally, CW scattering results are used to find a set of experimental conditions suitable for the measurement of the ion temperature using a CO₂ pulsed scattering system. (28 refs.)

52.30 PLASMA FLOW; MAGNETOHYDRODYNAMICS

(see also 47.65 Fluid dynamics)

- 13577 On the geometry of vortex lines in magnetofluid flows. S.N.Singh, R.Babu (Dept. of Maths., Banaras Hindu Univ., Varanasi, India). *Nuovo Cimento B (Italy)*, vol.76B, ser.2, no.1, p.47-53 (11 July 1983). By employing the anholonomic description of basic equations governing MFD flows, certain geometrical results of physical importance are obtained. By assuming Beltrami flow, the conditions are derived for which the Maxwellian surfaces can be developed. The variation of the total energy along the vortex lines is also discussed. (7 refs.)
- 13578 A comparison of the full and reduced sets of magnetohydrodynamic equations for resistive tearing modes in cylindrical geometry. J.A.Holmes, B.A.Carreras, T.C.Hender, H.R.Hicks, V.E.Lynch, B.F.Masden (Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2569-77 (Sept. 1983). The results of numerical calculations using a full set of resistive magnetohydrodynamic equations are compared with the results of similar calculations using a reduced set of equations derived for Tokamaks in the limits of low beta and large aspect ratio ($\beta \sim \epsilon \ll 1$). The calculations, which are carried out in three-dimensional cylindrical geometry using initial value techniques, allow the comparison of linear stability properties as well as detailed nonlinear studies. The results of these calculations (including linear growth rates and eigenfunctions, the nonlinear evolution of single-helicity magnetic islands, and the nonlinear evolution of multihelicity cases) confirm the validity of the reduced set of equations at low beta in cylindrical geometry. (18 refs.)
- 13579 Axisymmetric toroidal equilibria with plasma flow. C.Copenhaver (Dept. de Recherches sur la Fusion Controlée, Centre d'Etudes Nucleaires, Fontenay-aux-Roses, France). *Phys. Fluids (USA)*, vol.26, no.9, p.2635-41 (Sept. 1983). A general equilibrium equation for an axisymmetric toroidal plasma having both toroidal and poloidal components of the magnetic field and plasma flow is derived. The possibility of a numerical treatment is discussed and polynomial solutions are obtained for several limiting cases. These solutions show that with flow rotation, the pressure and magnetic surfaces are no longer concentric, and that there is a significant displacement between these surfaces. A new result of hydrodynamic interest is the equilibrium equation for a compressible fluid. (19 refs.)
- 13580 Comment on 'Steady-state planar ablative flow' [Phys. Fluids 25, 1644 (1982)] [and reply]. J.R.Sanmartin, J.L.Montanes (Escuela Tecnica Superior de Ingenieros Aeronauticos, Univ. Politecnica de Madrid, Madrid, Spain), A.Barrero, W.Manheimer, D.G.Colombant, J.H.Gardner. *Phys. Fluids (USA)*, vol.26, no.9, p.2754-6 (Sept. 1983). For original paper see W. Manheimer et al., *ibid.*, vol.25, p.1644 (1982). Manheimer et al. used a steady-state model to calculate planar ablative flow under both uniform and nonuniform illumination. The model assumed an underdense isothermal rarefaction linking up to a steady-state overdense plasma. Sanmartin et al. comment that the underdense plasma cannot be in steady state if the rarefaction is isothermal. They calculate similarity solutions for the case where the absorbed irradiance increases linearly in time. Manheimer et al. reply to these comments. (6 refs.)

52.35 WAVES, OSCILLATIONS, AND INSTABILITIES IN PLASMA

- 113581 Solenoidal excitation of eigenmodes in cylindrical magnetized plasma with two ion species. T.D.Kieu, W.N.-C.Sy (Dept. of Theoretical Phys., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia). *Aust. J. Phys. (Australia)*, vol.36, no.4, p.491-9 (1983). The conditions for the experimental observation of new types of eigenmodes in a typical laboratory magnetized plasma with two ion species are discussed. It is shown that the most favourable condition occurs during the current carrying phase of the discharge, with an appropriately chosen mixture of ions. (13 refs.)
- 113582 The gravitational instability of a rotating plasma in the presence of finite Larmor radius, Hall currents and suspended particles. K.C.Sharma (Dept. of Math., Himachal Pradesh Univ., Simla, India). *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.419-24 (Aug. 1983). The gravitational instability of an infinite homogeneous self-gravitating and finitely conducting, rotating gas-particle medium, in the presence of finite Larmor radius, Hall currents and suspended particles effects is considered. Particular cases of the effects of rotation, finite conductivity, finite Larmor radius, Hall currents, and suspended particles on waves propagating along and perpendicular to magnetic fields are discussed. It is found that the Jeans's criterion remains unchanged in the presence of rotation, finite conductivity, finite Larmor radius, Hall currents, and suspended particles. (9 refs.)
- 113583 To a nonlinear theory of interaction of radiation with plasma surface vibrations. I.H.Peneva, G.I.Zaginailov, A.N.Kondratenko, V.M.Kuklin. *Bulg. J. Phys. (Bulgaria)*, vol.10, no.3, p.3531-67 (1983). In Russian. The nonlinear mechanism of saturation and the consequences of instability development under the action of external radiation with the plasma surface is considered in this work in the case of excitation of surface vibrations. The phase shift and amplitude of the surface vibrations as well as the condition for the instability development have been found. Nonlinear damping of the surface vibration, defined by the process of scattering of the external radiation has been determined as a function of the surface wave amplitude. (13 refs.)
- 113584 Two-dimensional problem of the formation of a disturbed zone in the vicinity of a plate when a supersonic rarefied plasma flows over it. V.A.Semenov. *Cosmic Res. (USA)*, vol.20, no.6, p.597-606 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.848-58 (Nov.-Dec. 1982). [received: Sept. 1983]. The planar problem of the formation of a disturbed zone in the vicinity of a long strip moving with a high supersonic velocity in a Maxwellian collisionless plasma is analyzed allowing for the effect of electric fields on the structure of the disturbed zone. A statement of the problem is given and a critical analysis is made of the existing approaches to its investigation. (7 refs.)
- 113585 Hydromagnetic stability of a self-gravitating rotating viscous plasma in the presence of gyroviscosity. V.D.Sankhla, J.L.Bansal (Dept. of Maths., Univ. of Jodhpur, Jodhpur, India). *Indian J. Phys. Part B*, vol.57B, no.3, p.246-54 (June 1983). The hydromagnetic stability of a self-gravitating, incompressible, infinitely conducting, rotating viscous plasma of variable density is studied to include the effects of finiteness of the ion Larmor radius (FLR). The ambient magnetic field is assumed to be uniform and horizontal. The FLR effects have been included through stress tensor. Making use of existence of the variational principle which is shown to characterize the problem, proper solutions have been obtained for a semi-infinite plasma having density stratification along the vertical direction, according to the exponential law of density. The dispersion relation has been solved numerically for different values of the parameters involved. It is found that effect of FLR is destabilizing whereas character of viscosity and that of coriolis forces is stabilizing. (10 refs.)
- 113586 Nonlinear electron oscillation driven by an external wave in a plasma. M.Mengoli, V.G.Molinari (Lab. di Ingegneria Nucleare di Montecucolino, Univ. di Bologna, Bologna, Italy), F.Pizzio. *Nuovo Cimento B (Italy)*, vol.76B, ser.2, no.2, p.130-8 (11 Aug. 1983). The authors deal with electron oscillations in the field of a monochromatic wave having large phase velocity. The aim of this work is to extend to the hot-plasma case, by taking into account also the collision effects, the results obtained in the framework of the cold-plasma approximation. The expressions of the electron densities, as functions of space and time, are given for the two cases of a progressive and a stationary excited longitudinal wave. (4 refs.)
- 113587 Stochastic behavior in presence of an electrostatic wave due to the crossing of multiple cyclotron resonances in an inhomogeneous magnetic field. N.A.Ryabova, D.R.Shklyar. *Phys. Lett. A (Netherlands)*, vol.97A, no.5, p.194-8 (29 Aug. 1983). The criterion for the occurrence of stochastic behavior of particle trajectories in the field of an electrostatic wave is obtained taking into account the longitudinal inhomogeneity of the ambient magnetic field. The origin of the stochasticity is explained. The optimum conditions for particle heating are obtained at a wave amplitude below the threshold of stochasticity in a homogeneous plasma. (5 refs.)

- 113588 Nonlinear evolution of an obliquely propagating Langmuir wave: boundary-value problem.** C.R.Menyuk (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2482-7 (Sept. 1983). The nonlinear evolution of an obliquely propagating Langmuir wave is explored given boundary-value conditions, with emphasis on determining the effect of a transition between regular and stochastic electron motion. It is shown that when the angle of propagation is increased, the usual amplitude oscillations disappear because of destructive interference between the different, isolated resonances. It is also shown that the final ($z \rightarrow \infty$) wave amplitude decreases when there is a parameter transition from the trapping to the stochastic regime because electrons become free to travel large distances in velocity space, taking large amounts of energy from the wave. (16 refs.)
- 113589 Stabilization of the lower-hybrid drift instability by resonant electrons.** Yu-Juan Chen (Electronics Res. Lab., Univ. of California, Berkeley, CA, USA), W.M.Nevins, C.K.Birdsall. *Phys. Fluids (USA)*, vol.26, no.9, p.2501-8 (Sept. 1983). The lower-hybrid drift instability is studied with a two-dimensional electrostatic simulation code. Simulations show good agreement of the measured local growth rates and frequencies with the results of local theory during the early stage of wave growth. At later times nonlocal effects become important, and a coherent mode structure develops. This normal mode is observed to propagate up the density gradient. At zero plasma beta and zero electron temperature, it is found that the lower-hybrid drift instability is stabilized by the local current relaxation due to both ion quasilinear diffusion and electron $\mathbf{E} \times \mathbf{B}$ trapping which causes electron heating to occur. (10 refs.)
- 113590 Stabilization of the tearing mode in high-temperature plasma.** J.F.Drake, T.M.Antonsen, Jr., A.B.Hassam, N.T.Gladd (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2509-28 (Sept. 1983). An analytical and numerical study of the stability of tearing modes is carried out using the Braginskii fluid equations. An electron temperature gradient coupled with finite (nonzero) parallel thermal conductivity causes large parallel currents to flow in the vicinity of the singular layer (where $\mathbf{k} \cdot \mathbf{B} = 0$). The pressure-driven currents are stabilizing and in the limit $\beta L_e^2 / L_n^2 > 1$, where β is the ratio of the thermal to magnetic pressure and L_e and L_n are the magnetic shear and density scale lengths, the linear tearing mode no longer exists. In this high- β limit, the magnetic perturbation of the tearing mode is completely shielded from the singular layer so that no reconnection of the magnetic field can take place. The relationship between the tearing mode and previously investigated temperature-gradient-driven modes and the implications of the results for resistive modes in present and future Tokamak discharges is discussed. (28 refs.)
- 113591 Filamentation instability in magneto plasmas.** S.P.Kuo (Polytech. Inst. of New York, Farmingdale, NY, USA), G.Schmidt. *Phys. Fluids (USA)*, vol.26, no.9, p.2529-36 (Sept. 1983). It is shown that the filamentation of ordinary-mode pumps propagating at an arbitrary angle with respect to the magnetic field has to be magnetic field-aligned, but not for extraordinary-mode pumps. A general dispersion relation is derived including the effects of magnetic field and collisions, and the nonlinear effects of ponderomotive force, thermal focusing force, and the beating currents. Threshold field and growth rates are obtained and compared to the results of the unmagnetized and collisionless case. Applications of these results to ionospheric modifications are discussed. (14 refs.)
- 113592 Scattering of lower-hybrid waves by drift-wave density fluctuations: solutions of the radiative transfer equation.** P.L.Andrews, F.W.Perkins (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2537-45 (Sept. 1983). The investigation of the scattering of lower-hybrid waves by density fluctuations arising from drift waves in Tokamaks is distinguished by the presence in the wave equation of a large, random, derivative-coupling term. The propagation of the lower-hybrid waves is well represented by a radiative transfer equation when the scale size of the density fluctuations is small compared to the overall plasma size. The radiative transfer equation is solved in two limits: first, the forward scattering limit, where the scale size of density fluctuations is large compared to the lower-hybrid perpendicular wavelength, and second, the large-angle scattering limit, where this inequality is reversed. The most important features of these solutions are well represented by analytical formulas derived by simple arguments. Based on conventional estimates for density fluctuations arising from drift waves and a parabolic density profile, the optical depth τ for scattering through a significant angle, is given by $\tau \approx 2(N_e / n_e) (\omega_{pe} / \omega)^2 (m_e c^2 / 2T_i)^{1/2} [c / \alpha (R_i \Omega_e)^{1/2}]$, where ω_{pe} is the central ion plasma frequency and T_i denotes the ion temperature near the edge of the plasma. Most of the scattering occurs near the surface. The transmission through the scattering region scales as τ^{-1} and the emerging intensity has an angular spectrum proportional to $\cos \theta$, where $\sin \theta = \mathbf{k}_\perp \cdot \mathbf{B}_p / (k_\perp B_p)$, and \mathbf{B}_p is the poloidal field. (21 refs.)
- 113593 Spectral broadening of lower-hybrid waves by time-dependent density fluctuations.** P.L.Andrews, F.W.Perkins (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2546-57 (Sept. 1983). Lower-hybrid waves injected into Tokamaks are scattered by turbulent time-dependent drift-wave density fluctuations. This scattering process gives rise to frequency shifts as well as angular deviations. In Tokamaks, most of the frequency spreading occurs in a regime where the angular scattering results from multiple scattering events, each event having a small mean-square scattering angle. A radiative transport equation governing diffusion in both angle and frequency is derived. The solution is obtained in slab geometry via separation of variables and leads to a Mathieu equation. In the limit where the slab thickness l exceeds the typical distance for diffusion through a large angle l_0 , an explicit generalization of the diffusion solution to the radiative transfer equation is formed. This solution gives the combined angular and frequency spectrum in the scattering layer. In the thick slab limit, the RMS frequency width of lower-hybrid waves emerging from the layer is given by $\Delta\omega = (\omega_{pe} / \omega) N_e (M_i / m_e) \beta_i^{1/2} (1/l_0)$, where ω_{pe} and β_i^{-1} are the characteristic angular frequency correlation length of the drift-wave turbulence. (20 refs.)
- 113594 Spectrum of compressional Alfvén waves.** S.M.Mahajan, D.W.Ross (Fusion Res. Center, Univ. of Texas, Austin, TX, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2561-4 (Sept. 1983). The spectrum of compressional Alfvén eigenmodes localized in the potential well created by a combination of the variation in plasma density and the wavenumber $k_\perp = m/r$ is obtained, and its importance for radio frequency current drive is discussed. It is found that modes with small parallel wavenumbers and frequencies below the ion cyclotron frequency are attractive for current drive. (11 refs.)
- 113595 On tearing modes in a resistive medium.** P.Rosenau (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2578-89 (Sept. 1983). The theory of tearing modes in cylindrical symmetry is reexamined. The resistive medium is characterized by the simplest Ohm's law. By considering β , the ratio of thermal to magnetic pressure, as a parameter with respect to which the sought-after eigenvalues were scaled, a very simple description was obtained. Many of the classical results were obtained in a more simple way. Among the new results are: (1) the possibility of the existence of a tearing mode on a resistive time scale, which is hardly affected by drift effects; and (2) for modes of an almost marginal growth rate inertia does not play an important role, slab and cylindrical modes are fundamentally different, and finite- β effects play a crucial role. (18 refs.)
- 113596 Energetics and the resistive tearing mode: effects of Joule heating and radiation.** R.S.Steinolfson (Dept. of Phys., Univ. of California, Irvine, CA, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2590-602 (Sept. 1983). Hydromagnetic theory is used to investigate the influence of Joule heating and temperature-dependent radiation on the linear development of the incompressible, resistive tearing instability in both force-free and neutral-sheet magnetic fields in a slab geometry. A temperature-dependent resistivity couples the energetics and the dynamics of the instability. Analytical expressions are derived for the growth rates utilizing, in separate analyses, the constant- Ψ and the long-wavelength (nonconstant- Ψ) approximations. The solutions indicate the occurrence of several modes in addition to the usual tearing mode. A number of the modes have relatively slow, complex growth rates. However, at large values of the magnetic Reynolds number S ($S \geq 10^7$), the actual value depending on the relevant parametric values, there are at least two modes with purely exponential growth (real, positive growth rates) when the radiative loss decreases with increasing temperature. One is the resistive tearing mode, and the other is a more rapidly growing mode with a growth rate resembling that of a thermal instability. If the radiation is neglected, the Joule heating alone also results in two modes with real, positive growth at large S . One mode is again the tearing mode, but, in this case, the second mode is a more slowly growing Joule-heating mode. Another point of departure from previous theoretical results is that, below a particular value of S ($S \leq 10^6$, the value once again being determined by the parameters), all the modes are generally stabilized. (31 refs.)
- 113597 Ballooning mode calculations in stellarators.** H.L.Berk, M.N.Rosenbluth (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA), J.L.Shohet. *Phys. Fluids (USA)*, vol.26, no.9, p.2616-20 (Sept. 1983). A magnetohydrodynamic (MHD) ballooning mode formalism and calculation is used to show how a field-line-following code can be used to study MHD stability. The asymptotic analysis of the ballooning equation yields the Mercier condition. It is shown that first-order equilibrium effects on the vacuum fields from finite pressure cancel the intrinsically destabilizing term of the Mercier condition. A ballooning unstable solution is found in a Helic configuration that has a magnetic well at zero beta and a rotational transform that increases radially outward. (12 refs.)
- 113598 Asymptotic theory of the internal kink mode in current-carrying toroidal plasmas.** G.B.Crew, J.J.Ramos (MIT, Cambridge, MA, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2621-34 (Sept. 1983). An asymptotic approach to the linear stability of the ideal magnetohydrodynamic internal kink mode in large-aspect-ratio Tokamak plasmas is presented. This analysis spans arbitrary values of the plasma pressure gradient, and in particular demonstrates the stabilization of the mode at sufficiently high beta. (17 refs.)
- 113599 Anisotropy effects on curvature-driven flute instabilities in a hot-electron plasma.** D.A.Spong (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), H.L.Berk, J.W.Van Dam, M.N.Rosenbluth. *Phys. Fluids (USA)*, vol.26, no.9, p.2652-6 (Sept. 1983). The effects of finite parallel temperature are investigated for a hot-electron plasma with sufficiently large beta that the magnetic field scale length (Δ_B) is small compared with the vacuum field radius of curvature (R). Numerical and analytical estimates of stability boundaries are obtained for the four possible modes that can be treated in this limit: the conventional hot-electron interchange, the high-frequency hot-electron interchange ($\omega > \omega_{ce}$), the compressional Alfvén mode, and the interacting pressure-driven interchange. (9 refs.)
- 113600 Backscattering cascade of beam modes off ambient density fluctuations.** D.A.Russell, M.V.Goldman (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2717-30 (Sept. 1983). The effects of a given nonthermal low-frequency density-fluctuation spectrum on the amplification of Langmuir waves by a 'bump-on-tail' beam of electrons are studied. The density-fluctuation spectrum is assumed to contain a uniform distribution of wavelengths ranging from much shorter than the beam mode wavelength to of the same order. This permits multiple large-angle (back) scattering to occur. One-dimensional numerical solutions of the kinetic equations are found which yield criteria for linear saturation of the beam instability by a cascade of backscattering to high wavenumber. The relevant time scales and spectral shapes are also determined in both the stable and unstable regions. Linear damping and Cerenkov emission by a possible nonthermal tail of electrons is taken into account. An application is made to the beam modes observed simultaneously with density fluctuations off the Jovian bow shock. It is shown that the observed level of density fluctuations is sufficient to saturate the unstable Langmuir waves, although nonthermal Landau damping may prevent a cascade to very high wavenumbers. (6 refs.)
- 113601 Nonlinear periodic solutions for the isothermal magnetostatic atmosphere.** B.C.Low, A.J.Hundhausen (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA), E.G.Zweibel. *Phys. Fluids (USA)*, vol.26, no.9, p.2731-41 (Sept. 1983). A set of analytical, periodic magnetostatic solutions is presented describing parallel filaments of diffuse, magnetized plasma suspended horizontally in equilibrium in a uniform gravitational field. The magnetic field has no component along the filament, and the temperature is uniform in space. The problem is two dimensional and reduces to solving the magnetostatic equation of Dungey in a nonlinear form. Different field topologies are associated with the same basic plasma structure, depending on the sign and strength of the field far above and below the array of parallel filaments. These equilibria are shown to be locally unstable against ideal magnetohydrodynamic perturbations having large wavenumbers along the plasma filaments. It is suggested that the system may be stabilized if there is a component of the magnetic field parallel to the plasma filaments. (23 refs.)

- 3602 Soliton experiments in plasmas.** K.E.Lonngrén (Dept. of Electrical & Computer Engng., Univ. of Iowa, Iowa City, IA, USA). *Plasma Phys. (GB)*, vol.25, no.9, p.943-82 (Sept. 1983). The experiments on solitons in plasmas performed during the period 1970 to 1982 are reviewed. Suggestions for future experiments are presented. (309 refs.)
- 3603 Effect of nonlinear Landau damping on long time behaviour of modulational instability of Langmuir wave.** J.C.Bhaktia (Dept. of Appl. Math., Calcutta Univ., Calcutta, India), D.Majumder, M.R.Gupta. *Plasma Phys. (GB)*, vol.25, no.9, p.983-90 (Sept. 1983). The effect of nonlinear Landau damping on the long term behaviour of the modulational instability of a monochromatic Langmuir wave has been investigated. The growth or decay of the perturbation amplitude is oscillatory in character. Most of the time the amplitude changes approximately linearly with time. Growth occurs for negative nonlinear frequency shift while it decays when the frequency shift is positive. (8 refs.)
- 3604 Selective destabilization of ion cyclotron modes.** M.J.Alpert, J.Barrett, M.A.Behrens (Plasma Phys. Res. Inst., Univ. of Natal, Durban, S Africa). *Plasma Phys. (GB)*, vol.25, no.9, p.1059-64 (Sept. 1983). Observations of the current-driven electrostatic ion cyclotron instability, both $T_e/T_i=1$ and $T_e/T_i \gg 1$, show that as the normalized wave number, $k_{\perp}\rho_i$ is varied, different modes ($m=1, 2, 3, \dots$) become successively the most unstable mode. The calculated values of $k_{\perp}\rho_i$ at which the cross-over from one mode to the next occurs are in reasonable agreement with the observed values provided that the local density gradient is taken into account. (18 refs.)
- 3605 Recurrence of electron cyclotron harmonic wave instability in a beam-plasma system.** V.K.Jain, P.J.Christiansen (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England). *Plasma Phys. (GB)*, vol.25, no.10, p.1169-72 (Oct. 1983). The recurrence phenomenon characterised by spatial amplitude modulation is observed on the first harmonic of electron cyclotron harmonic wave instability excited in a beam-plasma system. It is found that it results from an interference between a forced and a natural mode of oscillation at the harmonic frequency. (11 refs.)
- 3606 Surface ionic-sonic oscillations in inhomogeneous plasma.** M.Vorob'ev, A.N.Kondratenko, V.M.Kuklin. *Radio Eng. & Electron. Phys. (USA)*, vol.27, no.11, p.124-6 (Nov. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.11, p.2203-6 (Nov. 1982). [received: Sept. 1983] Dispersion characteristics of surface ionic-sonic waves are obtained and the effectiveness of exciting them by charged particle streams is discussed. It is shown that inhomogeneity in the density of plasma, with a subsequent frequency of the wave, leads to a qualitative change in the nature of its dispersion. The increments in the excitation of these waves by streams of charged particles depend weakly on the degree of plasma density inhomogeneity. (6 refs.)
- 3607 Formation of electrodynamic boundary layers during the propagation of sound in a confined low-temperature plasma.** I.M.Rutkevich (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1035-6 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.837-40 (Dec. 1982). [received: Sept. 1983] The problems of sound propagation in a low-temperature plasma occupy an important place in research on wave processes and instabilities in magnetogas-dynamic flows and gas discharges. The one-dimensional description of short-wave disturbances has been applied not only to an unbounded plasma but also to the investigation of the longitudinal propagation of disturbances in channels. In this connection the author focuses attention on the formation of a distinctly multidimensional structure of electric-current disturbances in a sound wave propagating in a magnetic field along a channel of finite width. (8 refs.)
- 3608 Dissipative trapped ion instability in PLT and INTOR.** A.Wakamatsu, K.Shimizu, M.Ogasawara. *Report IPPJ-635*, Nagoya Univ., Japan (June 1983), 20 pp. The generation conditions of the dissipative trapped ion instability (DTII) are investigated for the parameters of PLT and INTOR. The finite banana width effect is taken into account in the dispersion relation. The conditions are greatly influenced by the impurities. Though the plasmas are well in the banana regime in both PLT and INTOR, DTII is not excited for $Z_{\text{eff}}=3.5$, and excited but it has negative growth rate for $Z_{\text{eff}}=1.5$, where Z_{eff} is the effective charge number. Only for the pure case ($Z_{\text{eff}}=1.0$), the growth rate has small positive value in INTOR. (6 refs.)

52.35R Plasma turbulence

- 113609 Magnetically induced plasma rotation and the dense plasma focus.** E.A.Witalis (Nat. Defence Res. Inst., Stockholm, Sweden). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.949-58 (Sept. 1983). Fusion for fission fuel breeding and other incentives for unconventional magnetic fusion research are introductorily mentioned. The design, operation and peculiar characteristics of dense plasma foci are briefly described with attention to their remarkable ion acceleration and plasma heating capabilities. Attempts for interpretations are reviewed, and a brief account is given for an explanation based on the concept of magnetically induced plasma rotation, recently derived in detail in this journal. Basically an ion acceleration mechanism of betatron character, it describes (in combination with a dynamic, generalized Bennett relation focus plasma) characteristics like the polarity dependence, the current channel disruption, the axial ion beam formation and the pre-requisites for the ensuing turbulent plasma dissipative stage. Fundamental differences with respect to mainline fusion research are emphasized, and some conjectures and proposals are presented as to the further development of plasma focus nuclear fusion or fission energy production. (46 refs.)
- 113610 Observation of self-binding turbulent fluctuations in simulation plasma and their relevance to plasma kinetic theories.** R.H.Berman, D.J.Tetreault, T.H.Dupree (MIT, Cambridge, MA, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2437-59 (Sept. 1983). Non-wave-like fluctuations of the phase-space density are observed in simulations of turbulent plasma. During decay from an initial state, the mean square fluctuation level decays at a much slower rate than that of an individual fluctuation. The distribution function of the fluctuation amplitudes becomes non-Gaussian (skewed) in favor of negative fluctuations. An enhancement in the aggregate fluctuation lifetime is also observed when the turbulence is driven by an external source. A model based on a collection of self-binding negative fluctuations, called phase-space density holes, can explain the observations. Collisions between holes produce hole fragments and lead to fluctuation decay. However, the hole fragments are self-binding and tend to recombine into new holes. The implications of these results for kinetic theories of plasma turbulence are discussed. In particular, it is shown that the theory of clumps, when suitably modified to include fluctuation self-binding, can explain many features of the nonlinear instability recently observed in computer simulations. (14 refs.)
- 113611 Growth of phase-space density holes.** T.H.Dupree (MIT, Cambridge, MA, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2460-81 (Sept. 1983). Phase-space density holes are shown to grow in a plasma for any nonzero electron-ion drift velocity. As a hole grows, its depth, velocity width, and electrostatic potential increase. For a hole with velocity u , the growth rate is of order $-v_{Te}^2 f_{0e}(u) v_{Te}^2 f_{0e}(u)$ times the bounce frequency of a particle trapped in the hole. The theoretical predictions agree reasonably well with a recent computer simulation. The results call into question the role of linear stability theory. Energy and momentum conservation are analyzed in detail, and the relationship to the clump instability is discussed. (8 refs.)
- 113612 A new interpretation of the alpha effect.** R.K.Keinigs (Los Alamos Nat. Lab., Los Alamos, NM, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2558-60 (Sept. 1983). In a magnetized plasma the alpha effect represents a turbulently generated EMF directed along the mean magnetic field. This EMF is central to the understanding of turbulent generation of large-scale magnetic fields. The alpha effect is reevaluated in terms of ensemble-averaged properties of the magnetic fluctuation spectrum. The results indicate that it is current helicity as opposed to kinetic helicity that is required to produce an alpha effect. (9 refs.)
- 113613 Centrifugal isotope separation in zirconium plasmas.** M.Krishnan (Appl. Phys. Section, Yale Univ., New Haven, CT, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2676-82 (Sept. 1983). Centrifugal isotopic enrichment in a zirconium vacuum arc centrifuge is described. Peak, single-pass enrichments up to 1700% for $^{96}\text{Zr}^{2+}$, 330% for $^{94}\text{Zr}^{2+}$, 280% for $^{92}\text{Zr}^{2+}$, and 50% for $^{91}\text{Zr}^{2+}$ were measured, for a discharge current of 3.7 kA and magnetic field strength of 0.17 T. Such high enrichments are compared with predictions of a simple, two-fluid centrifuge model. (23 refs.)

52.35T Shock waves

113614 Structure of perpendicular shocks in collisionless plasma. M.M.Leroy (Univ. of Maryland, College Park, MD, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2742-53 (Sept. 1983). The macrostructure of perpendicular shocks in the supercritical regime is investigated theoretically. The coupling between the shock precursor (foot region) associated with reflected ions and the magnetic ramp associated with electron Ohmic heating is analyzed using a model in which the ions are treated as a multifluid and the electrons as a massless fluid. The results are found to be in good agreement with a number of features exhibited by recent numerical simulations of perpendicular shocks, including the morphology of the reflected-gyrating ion stream, the presence of potential and magnetic field overshoots, and the Mach number dependence of the shock structure. (36 refs.)

113615 Potential double layer formed by a laminar shock wave in a collisionless plasma. S.Yagura, H.Fujita (Dept. of Electrical Engng., Saga Univ., Saga, Japan). *Plasma Phys. (GB)*, vol.25, no.10, p.1087-95 (Oct. 1983). A potential double layer is formed by exciting a laminar shock wave with a step injection of ion beam in a triple plasma device. A potential jump of the double layer moving with a velocity of laminar shock wave is $(1-1.4)kT_e/e$ and the density fluctuation is 15-40%. Time resolved measurements of energy distribution function of both ions and electrons reveal that electrons are trapped and ions are reflected due to the formation of the potential double layer. (20 refs.)

52.40 PLASMA INTERACTIONS

52.40D Electromagnetic wave propagation in plasma

113616 Localization of circularly polarized intense electromagnetic waves in relativistic plasmas. N.Nagesha Rao, R.K.Varma (Phys. Res. Lab., Navrangpura, Ahmedabad, India), P.K.Shukla, M.Y.Yu. *Phys. Fluids (USA)*, vol.26, no.9, p.2488-500 (Sept. 1983).

Localization of a circularly polarized, high-intensity electromagnetic field in a relativistic, unmagnetized plasma is considered. A new class of double-hump electromagnetic soliton solutions having nonzero high-frequency field intensity at the center is found for subsonic as well as supersonic velocities. For subsonic velocities, these solitons are found to be accompanied by density dips whereas supersonic solitons are associated with density humps. Parameter regions for the existence of different types of electromagnetic solitons are obtained explicitly. A few limiting cases of the general solutions obtained in the present theory are also discussed. (20 refs.)

113617 Nonlinearly induced radiation from an overdense plasma region. O.M.Gradov (Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR), L.Stenflo. *Plasma Phys. (GB)*, vol.25, no.9, p.1051-8 (Sept. 1983). A new mechanism for the nonlinear transparency of a bounded plasma is considered. The incident electromagnetic wave is supposed to decay into quasi-static eigenmodes which can propagate around the overdense region. Most of the transformed energy can be reradiated in specific directions from the particular plasma surface regions where the plasma parameters have proper values. The stationary state, that is established when the power of the induced radiation is equal to that of the incident, is also studied. (4 refs.)

113618 CO₂ collective laser scattering on moving density perturbations in a plasma. D.C.Schram, H.W.H.van Andel, G.le Clair, P.Brøderup (Dept. de Phys., Univ. de Montreal, Montreal, Quebec, Canada). *Plasma Phys. (GB)*, vol.25, no.10, p.1133-48 (Oct. 1983). CO₂ laser scattering from plasma density perturbations which are not wave-like in nature moving through the beam is calculated for various geometries and scale-lengths. Exact expressions are found for the heterodyne detector currents as a function of time, and for the corresponding frequency spectra. In particular, the cases of small-scale rotating density perturbations in cylindrical plasmas and off-axis rotation of the entire plasma column are analyzed in detail. By way of illustration, the theoretical results are compared with some measured scattering spectra from a magnetized arc. (16 refs.)

113619 Reflection, transmission and absorption of electromagnetic waves by an inhomogeneous random plasma slab. S.Yamaguchi, K.Mori, T.Hosono (Coll. of Sci. & Technol., Nihon Univ., Tokyo, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan)*, vol.166B, no.6, p.751-8 (June 1983). In Japanese.

The authors analyze interactions of electromagnetic waves with an inhomogeneous random plasma slab. Reflection phenomena of the electromagnetic waves in the case of oblique incidence are analyzed numerically. It is concluded that the obliquely incident TM wave is collisionlessly absorbed if plasma density becomes critical at some places, and then the usual homogeneous multilayer method is no longer applicable. Improvement of the physical model for random plasma and application of a modified homogeneous multilayer method are proposed to allow correct analysis under the previously mentioned conditions. (10 refs.)

113620 On the theory of induced electromagnetic wave scattering in heterogeneous plasma. V.N.Radzievskii. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.8, p.1259-61 (Aug. 1983). In Russian. Investigates the induced Raman backscattering of one of the pumping waves by a high-frequency component of plasma waves (superposed Langmuir and ion-acoustic waves). (2 refs.) V.G.P.

113621 Self-focusing in laser produced spark. J.S.Bakos, I.B.Foldes. *Report KFKI-1983-50*, Hungarian Acad. Sci., Budapest (1983), 14 pp. The self-focusing effect appearing in different phases of development of the laser produced breakdown plasma in air is investigated. Self-focusing during the ionization process is demonstrated. Thermal self-focusing was observed in the later stage of the plasma development at moderate light intensities. Plasma development was investigated by forward and side scattering of the laser light in the plasma. A crossed beam experiment gave evidence of the thermal mechanism of self-focusing. (17 refs.)

113622 Wall material characteristics in reacting plasma modelling. T.Kawamura, K.Akaiishi, A.Miyahara. *Report IPPJ-592*, Nagoya Univ., Japan (June 1982), 15 pp. Using the one-dimensional diffusion equation for impurities and energy balance equation for ions and electrons in the steady state Tokamak plasma, the self-consistent solutions of the impurity density profile and the temperature profile for a reacting DT plasma are analyzed, by taking into account of the plasma-surface interaction. On the basis of these results the influences of the impurities originated from the wall on the central plasma conditions and the Q-value of a reacting plasma are discussed. (8 refs.)

113623 Generation of higher harmonics of an intense laser beam in a plasma. M.B.Isichenko, V.V.Yan'kov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR). *JETP Lett. (USA)*, vol.37, no.7, p.351-3 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.297-8 (5 April 1983). [received: Oct. 1983]

The generation of higher harmonics of a pump beam by a mechanism involving a breaking of an electron wave is analyzed. The emission intensity is found to depend on the harmonic index in a power-law fashion, in agreement with experiment. (8 refs.)

113624 Ion heating due to explosive instability in an ion beam-plasma system. R.Sugaya (Dept. of Phys., Ehime Univ., Matsuyama, Japan). *Phys. Fluids (USA)*, vol.26, no.9, p.2698-703 (Sept. 1983).

Ion heating by the explosive instability in an ion beam-plasma system is studied theoretically. Two electrostatic waves with negative and positive energies become simultaneously unstable by nonlinear wave-particle interaction (nonlinear Landau damping) with plasma ions accompanying ion heating. The relaxation of the ion beam makes the explosion time of the waves much larger and causes saturation of the ion heating. It is shown quantitatively that the decrement of beam energy is transferred into thermal energies of plasma and beam ions by this explosive instability. (22 refs.)

113625 Effects of ion-acoustic instability on light ion beam transport in deuterium channels. D.G.Colombant, W.M.Manheimer (Plasma Phys. Div., Naval Res. Lab., Washington, DC, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2704-6 (Sept. 1983).

Moderate density deuterium channels can be ion-acoustic unstable when bunched high-intensity light ion beams are propagated into them. The magnetohydrodynamic response of these channels is investigated under these conditions. Anomalous effects like enhanced energy deposition, anomalous electron and ion heating, and anomalous resistivity are included in the model. Only at low channel densities does the instability cause an additional slowing down of the beam. However, the hydrodynamic motion of the channel remains unaffected. (5 refs.)

113626 Electromagnetic two-stream and filamentation instabilities for a relativistic beam-plasma system. Huan Lee, L.E.Thode (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2707-16 (Sept. 1983).

Previous investigations on the two-stream and filamentation instabilities are based on either the electrostatic or the ordinary-mode approximation. A general relativistic dispersion formulation is presented to study these two instabilities for a scattered electron beam propagating a collisional, bi-Maxwellian plasma. New analytical results that apply to a general beam distribution are obtained for the stability boundary of the filamentation instability. The general dispersion relation uncovers the inadequacy in applying the ordinary-mode approximation in a frame other than the rest frame of the plasma. Analytical expressions for the growth rates of the filamentation modes in various parameter regimes are obtained. Finally, numerical comparisons are made between the general dispersion results and the earlier results based on the electrostatic and ordinary-mode approximations. (17 refs.)

113627 Nonlinear interaction of high-current H⁺ and H⁻ ion beams. P.N.Ostroumov, O.V.Serdyuk (Inst. of Nuclear Res., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.143-5 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.230-4 (Feb. 1983). [received: Sept. 1983]

Results of a numerical simulation of nonlinear interaction of two high-current H⁺ and H⁻ beams are reported. A qualitative explanation is given for the interaction processes which occur when the relaxation time to the steady-state distribution is $\sim 20 T_0$, where T_0 is the period of the plasma oscillations. (4 refs.)

113628 Numerical simulations for intense light-ion beam propagation in channel under influence of plasma inertia. S.Kawata, K.Niu. *Report IPPJ-627*, Nagoya Univ., Japan (March 1983), 12 pp.

The intense light-ion beam (LIB) propagation through a plasma channel is numerically investigated by using a two-dimensional simulation code. Analyses are given for the LIB propagation which couples with the motion of channel plasma. Although the electron back current neutralizes the LIB current under a typical beam and channel plasma condition, the Lorentz force by the electron back current expands the LIB radially. The expansion of the LIB depends strongly on the density of the channel plasma. A strong current of the order of 1 MA is shown to propagate stably in the argon plasma channel. (11 refs.)

52.50 PLASMA PRODUCTION AND HEATING

- 3629 Motional impedance and heating of perfectly diamagnetic plasmas. B.N.Marihal, B.G.Jyoti (Dept. of Studies in Phys., Karnatak Univ., Dharwad, India). *Indian J. Phys. Part B*, vol.57B, no.3, p.255-61 (June 1983).
- Acceleration of solid diamagnetic spheres by a uniformly varying magnetic field is considered. Motional impedance which absorbs considerable amounts of energy even when its ohmic resistance becomes negligible is obtained for a perfectly diamagnetic plasma. Using equations of motion and circuit, the energy of the system is shown to be conserved. It is also shown that the mutual impact of two diamagnetic spheres gives rise to a temperature thermodynamic interest. Physical significance of the results is discussed with typical examples. A few important applications have also been discussed. (7 refs.)
- 3630 Measurements of electron and ion heating by Alfvén waves in the TCA Tokamak. A.De Chambrier, A.Heym, F.Hofmann, B.Joye, R.Keller, L.Lietti, J.B.Lister, P.D.Morgan (Centre de Recherches en Phys. des Plasmas, Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland), J.I.Peacock, A.Pochelon, M.F.Stamp. *Plasma Phys. (GB)*, vol.25, no.9, p.1021-35 (Sept. 1983).
- Alfvén wave heating experiments have been carried out in the TCA Tokamak. RF power up to 75% of the value of the ohmic heating power has been delivered to the plasma. Increases in axial electron temperature of up to 80% ($T_e \sim 400$ eV) and in axial ion temperature of up to 50% ($\Delta T_i \sim 75$ eV) have been measured. The RF pulse is accompanied by an increase in the radiated power loss, which becomes peaked on axis, and which is due to line emission from impurities predominantly iron. (36 refs.)
- 3631 Energy deposition profile of shear Alfvén wave heating. K.Itoh, Div. of Thermonuclear Fusion Res., JAERI, Tokai Ibaraki, Japan), S.-I.Itoh. *Plasma Phys. (GB)*, vol.25, no.9, p.1037-49 (Sept. 1983).
- The energy deposition profile of the shear Alfvén wave in a cylindrical tokamak is obtained. The radial propagation and the absorption are solved by use of the kinetic equations for collisionless inhomogeneous plasmas. The absorption is mainly by the resonance Landau damping, and occurs not only at the resonance surface, $k_{\parallel}(r)v_A(r) = \omega$, but also in the propagation region, $k_{\parallel}(r)|V_A(r)| \geq \omega \leq k_{\parallel}(r)|v_e(r)|$ (V_A : Alfvén velocity, v_e : electron thermal velocity, k_{\parallel} : parallel wave number and ω : frequency). The parameter dependence is studied and the magnetic shear and plasma profiles have important roles for the deposition profile. Efficient heating is possible if the condition $k_{\parallel}V_A \approx \omega$ is widely satisfied in the propagation region. The bulk heating does not always correspond to good antenna coupling, which often causes an unfavourable edge heating. For some typical parameters the energy input $W \sim 1$ W cm $^{-3}$ is expected when the wave amplitude B_{\parallel} is several gauss. (12 refs.)
- 3632 Multiple filament plug-in module for use on the Tara neutral beam source. J.W.Coleman, R.S.Post, R.P.Torti, J.E.Tracey (Plasma Fusion Center, MIT, Cambridge, MA, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1100-3 (Sept. 1983).
- A plug-in module bearing 14-20 tungsten filament emitters has been developed for use with the field-free neutral beam sources to be employed in the Tara tandem mirror experiments. Eight such modules constitute the total distributed cathode for one source. Each module has its own plug-in power connector, and may be removed from the source assembly as a unit, independently of the outer modules. The plug-in approach to construction results in a reduction both in the cost to build the source and in the time required for routine servicing and filament replacement. Plasma profiles are the same as in conventionally engineered sources of the same geometry. (4 refs.)
- 3633 Dynamic methods in plasma physics. V.E.Fortov (Inst. of Chem. Phys., Acad. of Sci. USSR). *Sov. Phys.-Usp. (USA)*, vol.25, no.11, p.781-809 (Nov. 1982). Translation of: *Sov. Fiz. Nauk (USSR)*, vol.138, no.3, p.361-412 (Nov. 1982). [received: Sept. 1983]
- Hydrodynamic methods of generating and diagnosing dense plasmas with strong interparticle interaction are reviewed. Experiments in shock and isentropic compression of matter to produce Boltzmann and degenerate plasma with maximum pressures in the tens of megabars are discussed. A method for isentropic expansion of metals that have been compressed by strong shock waves, which makes it possible to investigate a broad range of the phase diagram, including the high-temperature boiling curve and the neighborhood of the critical point, is described. The experimental schemes and designs of compressed-air and explosion-type nonideal-plasma generators and the diagnostic tools used are discussed. The results of experiments with nonideal plasmas are reported, and the influence of the interparticle interaction on the thermodynamic, electrophysical and optical properties of the strongly compressed plasma is analyzed on the basis of theoretical models. The properties of ultrahigh-pressure plasmas and prospects for laser electrodynamic and electroexplosive methods of generating strong shock waves in condensed media are discussed. (240 refs.)
- 3634 Simple method of sheet plasma production in lower pressure. U.Uramoto. *Report IPPJ-628*, Nagoya Univ., Japan (March 1983), 12 pp.
- A method of sheet plasma production in a lower pressure ($\sim 2 \times 10^{-4}$ Torr of H_2) is described. A primary sheet plasma produced between a discharge anode and cathode by the previous method due to two rectangular permanent magnets, diffuses into the low pressure region through a rectangular slit of the anode while electrons are reflected along magnetic field by a floating metal plate at the end of the plasma. 52.50J Plasma production and heating by laser beams

- 113635 Shock wave pressure enhancement using short wavelength (0.35 μ m) laser irradiation. R.J.Trainor, N.C.Holmes, R.A.Anderson, E.M.Campbell, W.C.Mead, R.J.Olness, R.E.Turner, F.Ze (Univ. of California, Lawrence Livermore Nat. Lab., Livermore, CA, USA). *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.542-4 (15 Sept. 1983).
- Shock velocities in planar aluminum targets irradiated at 0.35- and 1.06- μ m laser wavelengths have been measured. Absorbed intensities of $\sim 1.0 \times 10^{14}$ W/cm 2 , produced by 700-ps full width at half-maximum Gaussian pulses, generated shock pressures of 1.0 ± 0.2 and 0.6 ± 0.2 TPa, respectively, demonstrating an enhancement of shock pressure at decreased laser wavelength. (10 refs.)
- 113636 X-ray images and collapse time of gas-filled glass microspheres with an aspect ratio of 100-200 at a specific energy deposition 0.2 J/ng. V.V.Volenko, A.F.Ivanov, L.A.Myalitsin, L.A.Osadchuk, A.I.Saukov. *JETP Lett. (USA)*, vol.37, no.7, p.389-92 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.328-31 (5 April 1983). [received: Oct. 1983]
- Experiments on the laser bombardment of gas-filled glass microspheres with an aspect ratio $R/\Delta R = 100-200$ are reported. The SOKOL laser installation was used. The laser power density at the target was $q \approx (2-4) \times 10^{14}$ W/cm 2 ; the laser pulse length was $\tau_p \approx 1.0$ ns or $\tau_p \approx 0.3$ ns; and the specific energy deposition was $C_0 \approx 0.2$ J/ng. (9 refs.)

(Netherlands)*, vol.47, no.2, p.127-30 (15 Aug. 1983).
- The results of investigations of a plasma generated by irradiation of glass microspheres with high power laser pulses, and carried out with optical and X-ray diagnostics, are presented. Plasma jets appearing in the expanding laser plasma region were observed and hypotheses concerning their interpretation are suggested. Presented results were obtained in the course of experimental investigations within the range of laser microfusion carried out at the IPPLM. (10 refs.)
- 113638 Properties of the corona generated by the incidence of intense CO $_2$ laser pulses on spherical targets. R.Gratton, A.R.Piriz (Univ. Nacional del Centro de la Provincia de Buenos Aires, Tandil, Argentina). *Plasma Phys. (GB)*, vol.25, no.9, p.1009-20 (Sept. 1983).
- An analytic steady state model is described for the corona generated when a microsphere is isotropically irradiated by an intense CO $_2$ laser pulse. The main hypothesis of the model is that the energy transport from the absorption region to the pellet surface is due to a cloud of relatively high energy electrons (suprathermal electrons) whose mean free path is large with respect to the dimension of the corona, except in a thin layer close to the pellet surface. - 113639 Status of the US effort in atomic physics research relevant to the magnetically confined fusion program. C.F.Barnett (Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.1, p.1-7 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).
- The status of atomic physics research in the United States relevant to magnetically confined fusion plasmas is briefly reviewed. Program support is concentrated on performing benchmark experiments to confirm theory which will be used for a large fraction of the required data base. Recent advances and present needs in electron-ion collisions, ion-atom collisions, low energy collisions in ion sources, and atomic structure are emphasized. (31 refs.)
- 113640 Control of plasma in Tokamak equipment. V.F.Gubarev, M.M.Dargeiko, Yu.G.Krivosos, Yu.I.Samoilenko. *Cybernetics (USA)*, vol.18, no.5, p.687-93 (Sept.-Oct. 1982). Translation of: *Kibernetika (USSR)*, vol.18, no.5, p.127-31 (Sept.-Oct. 1982).
- Great attention has been and is being given to plasma research from which results of practical importance have been obtained. Most of these relate to Tokamak equipment that is currently regarded as the most promising solution for the problem of controlled thermonuclear fusion. The authors describe how at the Cybernetics Institute, Academy of Sciences of the Ukrainian SSR, there have been proposed and developed for such equipments certain fast-acting automatic magnetic-field regulators having spatially distributed members that interact with the plasma. Their operation is based on an essentially new impedance principle of regulation. This, first of all, has made it possible to create an automatic-control system for the position of a plasma column on the axis of the vacuum chamber with an effectiveness that was demonstrated for the first time in world practice on the type TO-1 equipment at the I.V.

Kurchatov Institute of Atomic Energy. The importance of this result can be judged by the fact that there are practically no modern Tokamak designs without an automatic control for the plasma column. (10 refs.)

113641 Measurement of sloshing-ion spatial profiles in end cell of tandem mirror experiment-upgrade (TMX-U). T.J.Orzechowski, S.L.Allen, J.H.Foote, R.K.Goodman, A.W.Molvik, T.C.Simonen (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2335-8 (Sept. 1983). Neutral-beam injection is used to establish an energetic sloshing-ion distribution in the end cells of the Tandem Mirror Experiment-Upgrade (TMX-U). The angular and radial distributions of these ions are measured with arrays of secondary-emission detectors. Unfolding the angular distribution gives the axial extent of the sloshing ions. Sloshing-ion density measurements from the charge-exchange flux indicate a high-density ($n_{\text{e}} \approx 3$ to $6 \times 10^{12} \text{ cm}^{-3}$) but narrow (FWHM $\sim 16 \text{ cm}$) sloshing-ion plasma. (15 refs.)

113642 Growth rate reduction of the curvature-driven flute instability by plasma blanket line tying. D.Segal (Dept. of Phys., Univ. of California, Irvine, CA, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2565-8 (Sept. 1983). The effect of an annular, line-tied blanket, on the curvature-driven flute in a magnetic mirror is considered. The blanket is assumed to be line tied to a thermoionically emitting annular end plate. Reduction of the flute growth rate is computed as function of Larmor radius, blanket radius and axial plasma conductance through either an external plasma or mirror sheath. It is found that significant reduction in growth rate can be achieved. (16 refs.)

113643 Finite Larmor radius stability theory of ELMO Bumpy Torus plasmas. H.L.Berk, C.Z.Cheng, M.N.Rosenbluth, J.W.Van Dam (Inst. for Fusion Studies, Univ. of Texas, Austin, TX, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2642-51 (Sept. 1983). An eikonal ballooning mode formalism is developed to describe curvature-driven modes of hot electron plasmas in bumpy tori. The formalism treats frequencies comparable to the ion cyclotron frequency, as well as arbitrary finite Larmor radius and field polarization, although the detailed analysis is restricted to $E_{\parallel}=0$. Moderate hot electron finite Larmor radius effects are found to lower the background beta core limit, whereas strong finite Larmor radius effects produce stabilization. The critical finite Larmor radius parameter with weak curvature is $FR = k_{\perp}^2 \rho_{\text{h}}^2 R / \Delta_{\text{b}} (1 + P_{\perp} / P_{\parallel})$ where k_{\perp} is the perpendicular wavenumber, ρ_{h} the hot electron Larmor radius, R the magnetic field radius of curvature at the hot-electron layer, Δ_{b} the magnetic field scale length in the diamagnetic well, and $P_{\perp, \parallel}$ are the parallel and perpendicular pressure gradients. The interchange instability arises if $1 > FR > -\beta_{\text{e}} R / [2\Delta (1 + P_{\perp} / P_{\parallel})]$, whereas all modes are stable if $FR > 1$, where β_{e} is the core plasma beta and Δ is the core plasma pressure gradient length. (19 refs.)

113644 Rotational stability of tandem mirrors. J.P.Freidberg, D.A.D'Ippolito (Plasma Res. Inst., Sci. Applications Inc., Boulder, CO, USA). *Phys. Fluids (USA)*, vol.26, no.9, p.2657-67 (Sept. 1983). The general stability equation for low- m rotational-ballooning instabilities in axisymmetric mirror geometry is derived for an isotropic pressure plasma, including a boundary term which represents the stabilizing effect of an unspecified anchor. The corresponding variational principle, together with a particular quadrupole anchor model, is used to compute the low- β rotational-interchange marginal stability condition for a conventional tandem mirror. The stability criterion is applied to show that low- m rotational modes are stable in the TMX experiment. Also, a mechanism for enhanced stabilization of curvature-driven modes when $E_{\parallel} < 0$ is discussed. (16 refs.)

113645 Quadrupole stabilization of the $n=2$ rotational instability of a field-reversed theta-pinch plasma. S.Ohi, T.Minato, Y.Kawakami, M.Tanjo, S.Okada, Y.Ito, M.Kako, S.Goto, T.Ishimura, H.Ito (Plasma Phys. Lab., Osaka Univ., Osaka, Japan). *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1042-5 (19 Sept. 1983). The $n=2$ rotational instability is the most dangerous gross instability in a field-reversed theta pinch. It is demonstrated for the first time that the instability is completely suppressed by superposing a quadrupole field which is much smaller than the axial confinement field at the separatrix. The experimental threshold intensity of the field for stabilization is about 2.5 times less than that predicted by theoretical stability analysis. (16 refs.)

113646 Confinement in a double-cusp electromagnetic trap. P.Couture, B.L.Stansfield (INRS-Energie, Univ. du Quebec, Varennes, Quebec, Canada). *Plasma Phys. (GB)*, vol.25, no.9, p.1001-8 (Sept. 1983). Measurements in an electrostatically stoppered double-cusp machine have verified the formation of an ion-confining potential well. However, a significant ion-confining barrier is not formed in the electrode region, and ions penetrate freely out to the grounded, interior electrode. It is only in the space between the interior electrode and the outer, negatively-biased, electrode that a large current drop is found to occur. (18 refs.)

113647 Numerical studies of toroidal coupling on low- m resistive modes. G.Kurita, M.Azumi, T.Tsunematsu, T.Takeda (JAERI, Ibaraki, Japan). *Plasma Phys. (GB)*, vol.25, no.10, p.1097-112 (Oct. 1983). Effects of the toroidicity and finite pressure on low- m ideal and resistive modes are studied numerically on the basis of the reduced set of the MHD equations. Both the linear and nonlinear analyses show that the $m=2$ mode is strongly destabilized by the above effects. The destabilization of the $m=2$ mode, however, is not directly related to the major disruptions. It is conjectured that the destabilized $m=2$ mode may change the equilibrium to the one unstable against the major disruption. (14 refs.)

113648 A comparison between laser induced fluorescence at Balmer-alpha and at Lyman-alpha for the measurement of neutral hydrogen densities in magnetically contained fusion plasmas. P.Gohil, D.D.Burgess (Blackett Lab., Imperial Coll. of Sci. & Technol., London, England). *Plasma Phys. (GB)*, vol.25, no.10, p.1149-67 (Oct. 1983). The authors examine the relative merits of laser induced fluorescence scattering at the Lyman-alpha and Balmer-alpha wavelengths for the measurement of both the spatial distribution and absolute magnitude of neutral hydrogen densities in fusion plasmas. The enhancements of the fluorescence signals for present and for saturation laser intensities are determined and signal to noise ratios are presented for a range of fusion plasma conditions. Details of the interpretation of the fluorescence signals, and the limitations, at the two wavelengths are discussed. In the hotter regions of the plasma, Balmer-alpha fluorescence scattering allows the measurement of neutral densities as low as 10^7 cm^{-3} , whereas present intensities from Lyman-alpha sources permit fluorescence measurements only for neutral hydrogen densities approaching 10^{10} cm^{-3} . Also presented is a technique for the spatial measurement of the electron number density based upon fluorescence scattering on the Balmer transitions, this process not being possible at Lyman-alpha for the range of electron densities in magnetically contained fusion plasmas. This may have applica-

tions in regions of the plasma otherwise difficult to diagnose, for example, near divertors and limiters. (42 refs.)

113649 Waves and turbulence in a Tokamak fusion plasma. C.M.Surko (Semiconductor & Chem. Phys. Res. Dept., Bell Labs., Murray Hill, NJ, USA), R.E.Slusher. *Science (USA)*, vol.221, no.4613, p.817-22 (26 Aug. 1983). The Tokamak is a prototype fusion device in which a toroidal magnetic field is used to confine a hot plasma. Coherent waves, excited near the plasma edge, can be used to transport energy into the plasma in order to heat it to the temperatures required for thermonuclear fusion. In addition, Tokamak plasmas are known to exhibit high levels of turbulent density fluctuations, which can transport particles and energy out of the plasma. Recently, experiments have been conducted to elucidate the nature of both the coherent waves and the turbulence. The experiments provide insight into a broad range of interesting linear and nonlinear plasma phenomena and into many of the processes that determine such practical things as plasma heating and confinement. (42 refs.)

113650 Feedback control experiment for plasma equilibrium in ASPERA-TOR-TM. S.Kitajima (Dept. of Nuclear Engng., Tohoku Univ., Sendai, Japan), Y.Funato, H.Watanabe. *Technol. Rep. Tohoku Univ. (Japan)*, vol.48, no.1, p.93-106 (1983). A simple method for a feedback control of the position of the plasma column in a small Tokamak discharge is presented. The analysis of this control system by means of the simple model is described. Applying this system to the shell-less small Tokamak, the authors clarify experimentally this system useful for the positional control. (11 refs.)

113651 Plasma equilibrium and field diffusion during current rise phase of STP-2 screw pinch tokamak. A.Nagata. *Report IPPJ-594*, Nagoya Univ., Japan (June 1982), 33 pp. Plasma equilibrium and field diffusion during the current rise phase of the discharge have been investigated in STP-2 screw pinch tokamak. The plasma with maximum poloidal beta value β_{p} of 3.0 has been obtained by compression and joule heating. However the maximum β_{p} value without strong wall contacts was about 1.3. The authors observed that force-free current is formed in the periphery of the plasma and the penetration rate of the poloidal magnetic field is much faster than the penetration rate calculated from the classical resistivity. To understand the high-beta plasma equilibrium and the mechanism of fast penetration rate observed in STP-2 plasmas the authors have performed a numerical simulation using a 2-D MHD pinch code 'TOPICS'. 70 PLASMA DIAGNOSTIC TECHNIQUES AND INSTRUMENTATION

- 652 Simultaneous measurement of magnetic field direction and ion temperature in a plasma by collective scattering with a CO_2 laser. W.Kasperek, H. J. Phys. (Bulgaria), vol.10, no.3, p.268-9 (1983).
- Approximations of the inverse functions $(-\alpha^2)$ and $(-\beta^2)$ suitable for computer treatment have been found from the two-thirds law for the vacuum diode. The accuracy of approximation and the region of validity satisfy completely the requirements of the probe diagnostics. (5 refs.)
- 653 A photoelectron spectrometer for measurement of electron plasma temperature. Yu.V.Gott, A.N.Silaev, R.R.Chistyakov, V.A.Shurygin (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
- J. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.463-7 (Sept. 1983).
- Results of work on a photoelectron spectrometer intended for the measurement of plasma electron temperature are described. The principle of its operation is based on the fact that the energy of a photoelectron knocked out of a target by an X-ray quantum unambiguously depends on the energy of this quantum. Thus, if one measures the energy spectrum of photoelectrons, one can find the energy distribution in a flux of radiation from a plasma. Resolution of the spectrometer and the efficiency of registration dependent on the radiation energy, thickness and material of the target are given. It is shown that the energy resolution varies from 15% to 45% with a change in the Ge target-thickness from 100 Å to 5100 Å. The calculated radiation registration efficiency with an energy of 8 keV for a Ge target 5100 Å thick is 1.3×10^{-4} electrons/quantum. Plasma electron temperature measurement with a photoelectron spectrometer has been simulated on a computer. (6 refs.)
- 655 Very high speed cinematography in the X-ray spectra applied to experiments of laser-matter interaction. C.Cavailler, N.Fleurot, M.Rostaing, Sauneuf (Centre d'Etudes de Limeil, CEA, Villeneuve-Saint-Georges, France).
- Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.93-100 (1983). In French. 1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
- The interpretation of experiments in pulsed laser-matter interaction requires the dynamic recording of phenomena involved in the plasma created by the high energy density concentrated in the target. For a number of years observations and measurements in the X spectral region, and particularly in the 1-10 keV range, have gained importance both in studies of the radiation emitted by the plasmas and in plasma diagnostics an external X-ray source. With these applications in view the authors have developed space and time resolved X-ray detectors with time resolution in the picosecond range. The authors present a survey of the design and operation of streak cameras their performance measured in terms of spatial and temporal resolution (3 to 10 ps at 15 lmm⁻¹). A large family of image tubes and cameras are described which have been studied and made in collaboration with Thomson-CSF and Laboratoire d'Electronique et de Physique Appliquées (LEP). The authors also present the range of cameras which are now under development at Limeil, with a spectral response in the soft X-ray region (2 to 20 V). Finally the authors present the results of two dimensional (framing) image studies with the 300 ps planar shutter tube from LEP. (7 refs.)
- 656 Imagery of laser imploded targets in the X-ray domain. J.Launach, C.Bayer, D.Billon, M.Decroisette, D.Juraszek, D.Maynial (Centre d'Etudes de Limeil, CEA, Villeneuve-Saint-Georges, France).
- Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.101-9 (1983). In French. 1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
- The authors present detail of an experimental device currently used at Limeil and outline the main phenomena and mechanisms involved in the implosion of a spherical target by intense lasers. With some results obtained in typical experiments the authors discuss the different possibilities for imagery in the X-ray domain. Namely: imagery by target emission and radiography of the target with an external X-ray source obtained using a laser beam (backlighting). A device is described which combines these two possibilities used simultaneously in the same experiment. Imagery by self-emission or backlighting with time resolution. Some results are given which are in agreement with numerical models. (8 refs.)
- 657 Two-frame flash X-radiography system for the study of particle beam fusion target implosions. J.Chang, D.L.Fehl (Sandia Nat. Labs., Albuquerque, NM, USA).
- Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.110-15 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
- A two-frame flash X-radiographic system has been developed for studying the plasma hydrodynamics of particle beam driven inertial confinement fusion targets. This system consists of two micro-point flash X-ray (FXR) sources, a micro-channel plate (MCP) X-ray sensitive cameras, and a space frame. The sources and cameras are arranged in pairs on the space frame to secure registration of the sources with the cameras and to provide ease of alignment with the target. The micro-point FXR sources have an output spectrum characteristic of a tungsten bremsstrahlung source with an end point energy of 600 keV, a source intensity of 8 mRad at 46 cm, and a spot size of approximately 100 μ m. A direct 4X magnification of a 3 mm gold target was

achieved by using this source in a backlighting arrangement with an overall system resolution of 4 lp/mm. This system has been used successfully to observe relativistic electron beam driven ablative pusher target implosions. (6 refs.)

- 113658 X-ray backlighting sources of 4 to 10 keV for laser fusion targets. V.C.Rupert, D.L.Matthews, L.N.Koppel (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
- Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.116-22 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
- High-density, short-duration X-ray pulses are necessary to diagnose the compression of laser fusion targets. Present target designs are such that backlighting sources range from a few thousand electron volts to 100 keV will be necessary. The desired source durations range from a few tens of picoseconds for flash radiography to several nanoseconds for streak irradiation laser pulse. For the latter reason, a laser-induced X-ray pulse is preferred. An initial study of the K lines of Ti, Ni and Zn as possible backlighting sources was conducted. The conversion efficiency of laser light into line radiation was obtained as a function of laser intensity, pulse length, and wavelength. A threshold laser intensity for X-ray line production was identified. Information was obtained on the size and duration of the X-ray emission source, in relation to laser parameters. The experimental results, and their impact on backlighting capability for high-density laser fusion targets, are discussed. (12 refs.)
- 113659 Ray tracing of a concave-curved-crystal spectrometer and its detailed characteristics for X-ray spectroscopic diagnostics of high-temperature plasmas. S.Morita (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan).
- Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1030-40 (June 1983).
- A method of ray tracing is presented for a spectrometer with a concave-curved crystal to be used for X-ray spectroscopic diagnostics of high-temperature plasmas. Calculations have been carried out for a LiF(200) crystal with a Rowland circle of radius 50 cm and a Gaussian rocking curve. With a linear X-ray source, the most suitable parameters of the spectrometer were accurately determined by use of the ray tracing, and the characteristics were investigated in detail. The ray tracing was also applied to a point source of X-rays, and the best conditions for geometric relations between the point source and the spectrometer were found. The spectral distortion is also described here analytically. The calculated line profile including the natural broadening of the X-ray source is compared with the experimental result of $FeK\alpha$. Good agreement is obtained. (15 refs.)
- 113660 Experimental investigation of absorption coefficient of cesium resonance doublets in a plasma of combustion products. I.A.Vasil'eva, L.V.Deputatova, A.P.Nefedov (Inst. of High Temperatures, Acad. of Sci., USSR).
- High Temp. (USA), vol.20, no.6, p.809-14 (Nov-Dec. 1982). Translation of: Teplofiz. Vys. Temp. (USSR), vol.20, no.6, p.1032-7 (Nov-Dec. 1982). [received: Sept. 1983]
- The authors give the results of an experimental investigation of the relation between the absorption coefficient and the emission frequency $\kappa(\Delta\nu)$ for the cesium resonance doublets 4555/4593 Å and 8521/8943 Å in a plasma of combustion products ($p=1$ atm, $T=2050$ K) with an alkali seed. The relative variation of the absorption coefficient at distances of 5-400 cm⁻¹ from the line centers is obtained. Individual regions of $\kappa(\Delta\nu)$ are approximated by an expression of the form $\kappa(\Delta\nu) \sim (\Delta\nu)^{-x}$. Near the line centers (up to 10-30 cm⁻¹) $x=2$, and on the line wings $x=1.2-0.7$. (11 refs.)

- Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.32-7 (1983). Translation of: Vestn. Mosk. Univ. Ser. 3 (USSR), vol.38, no.1, p.29-33 (1983).
- A method of determining the plasma potential is proposed, on the basis of the ionic part of the volt-ampere characteristics of an electric probe. (5 refs.)
- 113663 Converging shock on laser plasma: density profiles by holographic interferometry. A.Giulietti, D.Giulietti, M.Lucchesi, M.Vaselli (Istituto di Fisica Atomica e Molecolare, CNR, Pisa, Italy).
- Opt. Commun. (Netherlands), vol.47, no.2, p.131-6 (15 Aug. 1983).
- A double pulse ruby laser was used to obtain interference patterns from a laser produced plasma in helium. From patterns obtained at different times the electron density evolution was inferred by Abel inversion, with suitable approximations. There was a net evidence for electron density increase due to the action of a converging shock wave produced by reflection. (7 refs.)
- 113664 Applications of the Fraunhofer-diffraction method for plasma-wave measurements. Y.Sonoda, Y.Suetsugu, K.Muraoka, M.Akazaki (Dept. of Energy Conversion, Interdisciplinary Graduate School of Engng. Sci., Kyushu Univ., Fukuoka, Japan).
- Plasma Phys. (GB), vol.25, no.10, p.1113-32 (Oct. 1983).
- The improved theoretical analysis of Fraunhofer-diffraction method as a new means to measure the frequency, wavenumber, intensity and even spatial position and propagating direction of plasma waves is presented. It is further, experimentally verified and the measuring accuracies are ascertained by measurements in a microwave region, of ion-acoustic waves in a DC discharge. Successes of introducing the practically important conditions into theoretical analysis have made it possible to establish this method as a standard and powerful diagnostic technique for measurements of plasma waves and turbulences in various plasmas such as in Tokamaks. (17 refs.)
- 113665 Ten-channel grating chormator for electron cyclotron emission plasma diagnostics. J.Fischer, D.A.Boyd, J.Cavallo, J.Benson (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA).
- Rev. Sci. Instrum. (USA), vol.54, no.9, p.1085-90 (Sept. 1983).
- A grating polychromator for electron cyclotron temperature diagnostic experiments is described. Two aluminum gratings are used to allow the instrument to operate for Tokamak magnetic fields between 16-25 kG, i.e. for second harmonic electron cyclotron emission frequencies ranging between 90-140 GHz. The instrument utilizes an array of ten cryogenically cooled InSb hot electron bolometers to collect radiation at the focal surface of the spectrometer covering a fractional plasma radial distance of $\Delta R/R_0 \sim 0.3-0.4$, where R_0 is the major radius of the plasma. The resolving power of the

spectrometer has been measured to be $R = \nu/\delta\nu \approx 50$. This instrument thus provides high spatial (3 cm) and temporal resolution ($\sim 1 \mu\text{s}$) and large spatial coverage. The detector cryostat has measured cryogen hold times of $\geq 24 \text{ h}$ (liquid nitrogen) and $\approx 9 \text{ days}$ (liquid helium) providing ease of operation during long plasma runs. (14 refs.)

113666 Electron temperature monitor for laser-produced plasmas. A.Ng, K.Fong, A.J.Barnard, J.Kwan, D.Pasini (Phys. Dept., Univ. of British Columbia, Vancouver, British Columbia, Canada). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1091-4 (Sept. 1983).

The authors have developed a multichannel X-ray analyzer for monitoring electron temperatures in plasmas. The device consists of a step-wedge X-ray filter and a Reticon sensor array. By measuring the X-ray continuum emission from a laser-produced plasma with the device, the electron temperature can be determined to within 10%. (10 refs.)

113667 Holographic plasma interferometry in the infrared spectrum. II. Using nonlinear effects to increase the sensitivity. I.I.Komissarova, G.V.Ostrovskaya, V.N.Filippov, E.N.Shedova (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.156-9 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.251-7 (Feb. 1983). [received: Sept. 1983]

Experiments are described in which wave interference patterns reconstructed in high diffraction orders from holograms recorded in CO_2 laser light are exploited to increase the sensitivity of the interference/holographic technique. The factors determining the fringe quality in the interference patterns and the accuracy in measuring the shifts are examined, methods are given for eliminating fringe distortion, and optimal conditions are found for recording interference patterns. An accuracy of $\sim 2 \times 10^{14} \text{ cm}^{-2}$ in measuring $N_e l$ has been achieved, where N_e is the electron density and l is the transverse diameter of the probed plasma region. It is thus demonstrated that the interference/holographic method can be used to study plasma in Tokamaks. (4 refs.)

113668 Calculation of spectrum line emission from plasmas. H.Gordon, H.P.Summers, J.A.Tully.

Report CLM-R 229, UKAEA, Culham, Abingdon, Oxon., England (1982), 42 pp.

Available from HMSO, London, England.

The authors describe a number of Fortran computer programs and their associated data sets which will predict spectrum line emission from important species in fusion plasmas. The present work is concerned with the emission of line radiation by low lying excited states of ions. Three sets of plasma conditions are investigated, namely, the ionisation equilibrium plasma, the plasma developing in time and the plasma in a spatially inhomogeneous state. (24 refs.)

113669 Cathode spots and erosion of metal electrodes in channel of an open-cycle MHD generator. V.I.Zalkind, V.V.Kirillov, A.I.Markina.

High Temp. (USA), vol.20, no.6, p.941-6 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1182-7 (Nov.-Dec. 1982). [received: Sept. 1983]

Correlation of the experimental data obtained on several MHD devices reveals the main features of the behaviour of cathode spots in open-cycle MHD channels. The parameters of the cathode spots in MHD channels operating in different conditions were measured. The characteristics of the discharge and erosion of the electrodes were greatly affected by the film of seed compounds deposited on the electrode surface by the plasma stream in the channel of an open-cycle MHD generator. Data were obtained for the erosion of electrodes of different materials. (9 refs.)

113670 Transport models of particle and energy balance in Tokamak devices. D.P.Kostomarov.

Moscow Univ. Comput. Math. & Cybern. (USA), no.4, p.1-9 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 15 (USSR)*, no.4, p.6-12 (1982). [received: Sept. 1983]

A brief characterisation of the part played by mathematical modelling in research into plasma physics and controlled thermonuclear synthesis is provided. Transport models of particle and energy balance in Tokamak devices are described. Issues related to the incorporation of neutral residual-gas

particles into the transport model are considered. The use of the neutral-particle model for solving direct and inverse problems of corpuscular plasma diagnostics is described. (8 refs.)

113671 Construction of a high density plasma device for microwave-plasma interaction experiment. H.Mori, I.Iwamoto, E.Sagawa, T.Suiz, S.Yoshikado.

Rev. Radio Res. Lab. (Japan), vol.28, no.147, p.607-14 (Sept. 1982). In Japanese. [received: Sept. 1983]

A multi-dipole type plasma device was constructed for simulation experiments concerning the propagation of electromagnetic waves in the ionosphere. The device has the shape of a rectangular parallelepiped, the size of which is 60 cm in height, 60 cm in width, and 120 cm in length. In its early experiments, it was confirmed that very homogeneous and quiescent plasmas could be generated. A typical value of the electron density of the plasma is $3 \times 10^{10} \text{ cm}^{-3}$ under the condition that the emission current from the tungsten filaments is 2 A and the argon gas pressure is $4 \times 10^{-2} \text{ Pa}$. As a next step, the authors are going to construct a powerful microwave beam transmitter and receiving system to observe the interaction between the microwave beam and the high density plasma. (1 ref.)

113672 Relativistic plasma microwave generator. M.V.Kuzelev, F.Kh.Mukhametzyanov, M.S.Rabinovich, A.A.Rukhadze, P.S.Strelkov, A.G.Shkvarunets (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1030-2 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.829-32 (Dec. 1982). [received: Sept. 1983]

The possibility of generating electromagnetic waves in a plasma was essentially predicted when the beam-plasma instability was discovered. However, it became possible to build a plasma microwave generator only after theoretical and experimental studies had been made of the beam-plasma instability in finite magnetized plasmas using relativistic electron beams and after a general theory of plasma microwave generators had been developed. The authors describe an experimental realization of a relativistic plasma microwave generator and give a theoretical analysis of the experimental results. The excitation mechanism and basic parameters of this plasma generator are described well by the general theory of these devices. (8 refs.)

113673 Resonant helical magnetic limiter. G.Fuchs, A.Nicolai, G.H.Wolf, B.Steffen.

Report JUL-1820, Kernforschungsanlage, Jülich, Germany (Dec. 1982), 54 pp.

The physical goals and principles of helical magnetic limiters are described. They are used to develop design criteria for modular structures of helical conductors, which are then applied to a special case (TEXTOR). A 1-dimensional transport code is used to predict the plasma-parameters for the helical magnetic limiter case. These calculations show a substantial reduction (as compared to a normal limiter case) of the temperatures in the plasma boundary, while the plasma density stays high. (31 refs.)

(see also 51.50 Electrical phenomena in gases)

113674 Light emission of spark discharges in liquids. R.Germer (Inst. Tech. Akustik, Tech. Univ. Berlin, Berlin, Germany).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.123-8 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

When a condensor is discharged between two electrodes in a thin layer of liquid, a light flash is produced. The light emission is detected with a fast silicon detector filtered for red, green and blue light. The spark discharge and the shock waves in the liquid layer are photographed with X-ray flashes. The energy transfer to the gas plasma is much higher for a second or third discharge which follows the first discharge after some microseconds, if it is a discharge into the spark induced gas plasma and not in the liquid. The expansion of the gas plasma has therefore been studied in detail. A simple arrangement of two condensers and a coil makes it possible to produce flash sequences. The spark was produced in different organic liquids and H_2O . (6 refs.)

113675 Residual gas adsorption on electrode surfaces in vacuum. K.Tsuruta, M.Yano (Dept. of Electrical Engng., Ibaraki Univ., Hitachi, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1017-19 (June 1983).

The pre-breakdown currents of a vacuum gap both just after spark conditioning of the electrodes and after exposure to a vacuum were measured in a vacuum of $3 \times 10^{-5} \text{ Pa}$ using a switching impulse voltage. It was found that the exposure reduced the field emission current and that this reduction became greater with the exposure time. The reduction in the field emission current is considered to be the result of an increase in the work function due to adsorption of residual gases on the electrode surfaces. Current pulses were also observed to appear on the pre-breakdown currents measured after exposures of longer than 5 minutes. (5 refs.)

113676 Electron temperature in HF discharge plasma columns. G.Cicconi (Istituto di Elettrotecnica, Univ. of Genoa, Genoa, Italy).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1063-5 (June 1983).

Assuming the validity of Schottky's theory for the positive column, the electron temperature of plasma columns in HF stationary discharges is estimated by measuring their length. The discharges are produced in narrow quartz tubes. At particularly low pressure for a quasi capillary column, the estimation is made by a microwave reflectometric diagnostic using various equilibrium models to describe the column. (16 refs.)

113677 Measurement of electron temperature in a glow discharge with a double probe method. Dock-Chool Lee, Young-Il Kim, Dong-Ha Kim, Sang-Hyun Park.

Trans. Korean Inst. Electr. Eng., vol.32, no.4, p.128-35 (1983). In Korean.

As preliminary experiments for the formation of thin polymer films, electron temperature T_e in glow discharge of various gases has been studied with a double probe method. In a glow discharge at pure gases (Ar , N_2 , O_2), electron temperature decreases as gas flow rate, gas pressure in reactor and discharge power (Input) increase. The value of T_e in O_2 gas is greater than those of Ar , N_2 gases and T_e of Ar gas is almost the same as the value of T_e in N_2 gas. Electron temperature of glow discharge in gas mixtures ($\text{Ar}+\text{N}_2$, $\text{Ar}+\text{O}_2$, and $\text{Ar}+\text{H}_2$) indicates the same tendency as those in the pure gases but generally, the value of T_e is lower than those of pure gases. The value of

Te in case of $\text{Ar}+\text{O}_2$ is especially when lower compared with *Te* of other gases, i.e. Ar , O_2 , $\text{Ar}+\text{H}_2$ or $\text{Ar}+\text{N}_2$. (10 refs.)

113678 On trajectories of positive pulse charge streamers. A.V.Ivanov, V.P.Larionov.

Elektrichestvo (USSR), no.5, p.64-6 (May 1982). In Russian.

Studies the effect of electric field configuration on trajectories of streamer development. Reports on experiments with gaps of type bar-plane and bar-plane with a cylindrical projection. It is found that the trajectory of development of a positive discharge streamer zone can be influenced by very weak disturbances of the field of the order 1 kV/cm. An external field and the space-charge field have about equally the same influence on discharge development. (6 refs.)

113679 Endurance of electrically stressed epoxy resins determination by internal partial discharge amplitude distribution analysis. C.Mangiavacchi, G.Rabach (Istituto di Elettrotecnica e di Elettronica, Univ. di Trieste, Trieste, Italy).

Energ. Elett. (Italy), vol.60, no.6, p.211-20 (June 1983). In Italian.

An experimental study concerning epoxy resin endurance to partial discharge activity by means of partial discharge amplitude distribution (PDAD) analysis is presented. After discussing the preliminary choice of the samples to test and the possibility of fitting the experimental results with suitable multimodal distributions, some experimental histograms obtained during the test are analyzed. The possibility of detecting the beginning of new degradation processes during the test, by which, in a relatively short time, sample breakdown occurs is pointed out. (13 refs.)

113680 Electrical characteristics of a high-voltage electropulse discharge in a small enclosed volume of fluid. V.S.Goldaev.

Elektron. Obrab. Mater. (USSR), no.3, p.43-6 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*

A method is given of calculating the electrical efficiency of a pulse discharge in a small volume of fluid with the use of pulse-voltage and pulse-current generators, with a combined switching device and oscillograms of current and voltage. (5 refs.) *A.J.B.*

113681 Effect of water vapor on an externally maintained gas discharge.

Y.Yu.Baranov, R.K.Bevo, F.I.Vyskailo, A.P.Napartovich, S.V.Khomenko.

High Temp. (USA), vol.20, no.6, p.815-19 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1038-43 (Nov.-Dec. 1982). [received: Sept. 1983]

An investigation of the characteristics of an externally maintained discharge and the decay of its plasma in an electric field when the electron beam was cut off led to the measurement of a number of constants characterizing attachment and recombination in the discharge. In particular, the constant for three-body attachment of an electron to oxygen in air in the presence of water molecules is $K=3.5\cdot10^{-30}\text{ cm}^6\text{ sec}^{-1}$ for $E/N=1.5\cdot10^{-16}\text{ V cm}^{-1}$ and $K=3\cdot10^{-30}\text{ cm}^6\text{ sec}^{-1}$ for $E/N=3\cdot10^{-16}\text{ V cm}^{-1}$. The dependences of the effective recombination constant in nitrogen, air, and air-helium mixtures on the water vapor concentration, reduced electric field E/N , and energy input to the discharge were investigated. (11 refs.)

113682 Integral characteristics of electrode layers in capacitive medium-pressure HF discharge. N.A.Yatsenko (Inst. of Problems of Mech., Acad. of Sci., USSR).

High Temp. (USA), vol.20, no.6, p.820-6 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1044-51 (Nov.-Dec. 1982). [received: Sept. 1983]

The integral characteristics of the electrode layers of a spatial discharge and the discharge current density were experimentally investigated in relation to pressure up to tens of kilopascals in the unconstricted type of capacitive HF discharge burning steadily in air, helium, or CO_2 in normal current density conditions between plane cooled electrodes and the distant walls of the discharge chamber. The parameters of the spatially homogeneous plasma of the positive column of this type of discharge depend very strongly on the structure of the electrode regions, which may be qualitatively different. The role of a dielectric coating on the electrodes in a capacitive HF discharge is analysed. (20 refs.)

113683 Anode-plasma parameters of a high-voltage glow discharge ≈ 150 kV. L.N.Pustynskii, S.R.Kholev, G.V.Yakushin.

High Temp. (USA), vol.20, no.6, p.831-7 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1057-63 (Nov.-Dec. 1982). [received: Sept. 1983]

A single Langmuir probe has been used to examine the spatial distribution of the electron concentration in the anode plasma of a high-voltage glow discharge in deuterium at a maximum voltage of 150 kV. The electron temperature and the plasma potential have been determined. It is found that the length of the cathode-potential region is independent of the voltage but is determined by the pressure in the discharge tube. The pressure dependence of this length at the axis of the discharge $d_{\sim}p^{-1.4}$. The plasma propagates along the glass wall of the discharge tube, which causes curvature of the plasma boundary. The plasma-density relaxation time is not less than 10 μsec . (22 refs.)

113684 Gas breakdown in a dielectric cell with external electrodes.

Yu.I.Chutov, O.V.Korolyuk (Shevchenko Univ., Kiev, Ukrainian SSR).

High Temp. (USA), vol.20, no.6, p.837-44 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1064-71 (Nov.-Dec. 1982). [received: Sept. 1983]

A numerical solution has been obtained to the equations describing ionization in a dielectric cell with external electrodes filled with neon at $p_d=0.2\text{--}24\text{ mm Hg cm}$. The two-liquid hydrodynamic approximation is used with a self-consistent electric field and a Townsend ionization model. Allowance is made for the effects of the charges deposited on the inner walls of the cell. The distributions of the electrons and ions in space and time are derived along with the electric field strength, the ionization intensity, and the current pulses in the external circuit. Three phases in the ionization are observed, which differ in the mode of variation in the field in the gap. (17 refs.)

113685 Excitation of striations in the positive column of a glow discharge. D.Sengupta, S.N.Sengupta (Saha Inst. of Nuclear Phys., Calcutta, India).

J. Appl. Phys. (USA), vol.54, no.9, p.5451-2 (Sept. 1983).

A new method of exciting striations in the positive column of a glow discharge, by introducing a stream of electrons in the Faraday dark space, is presented. The method is capable of exciting striations at the natural frequencies of self-excited striations under similar discharge conditions. (5 refs.)

113686 Vibrational kinetics in liquid nitrogen cooled 5% CO-He radio-frequency discharges. S.De Benedictis, M.Capitelli, F.Cramarossa, R.d'Agostino, C.Gorse (Dipartimento di Chimica, Univ. di Bari, Bari, Italy), P.Brechignac.

Opt. Commun. (Netherlands), vol.47, no.2, p.107-10 (15 Aug. 1983).

5% CO-He radiofrequency discharges have been theoretically and experimentally studied in a liquid N_2 -cooled reactor operated at 6 torr as a function of

the residence time. The discharges are characterized by CO dissociation rates higher than those observed in uncooled discharges and by time-dependent non-Boltzmann vibrational distributions. A purely vibrational mechanism can reasonably be considered the main CO dissociation channel. The importance of O atoms as the main deactivating species, when CO_2 and C are at low density because they are trapped by the cooled walls, is stressed. (6 refs.)

113687 Relationship of the laser-induced population perturbation of excited levels with the dynamical optogalvanic signal in a discharge plasma. T.Fujimoto, Y.Uetani, Y.Sato, C.Goto, K.Fukuda (Dept. of Engng. Sci., Kyoto Univ., Kyoto, Japan).

Opt. Commun. (Netherlands), vol.47, no.2, p.111-16 (15 Aug. 1983).

For a pulsed-laser excitation of various neon transitions ($1s_2\text{--}2p_6$) in a glow discharge the population perturbations in the upper and lower levels are measured by emission and absorption spectroscopy, and the dynamical optogalvanic signals are observed. It is proposed that the population perturbation in the lower levels ($1s_2\text{--}1s_5$) as a whole is responsible for the optogalvanic signal, and that metastable-level populations determine its decay characteristics. The sign reversal of the optogalvanic signal that depends on the excitation condition is interpreted in this context. (6 refs.)

113688 Brillouin scattering of multiline laser light in a flowing plasma corona. R.W.Short, E.A.Williams (Lab. for Laser Energetics, Univ. of Rochester, Rochester, NY, USA).

Phys. Fluids (USA), vol.26, no.9, p.2342-4 (Sept. 1983).

Multiline lasers have been suggested as a means of reducing stimulated Brillouin scattering (SBS) from laser fusion target plasmas. It is shown that because of interaction between incident and reflected laser lines, Brillouin scattering may still occur even if each line individually is below SBS threshold. The resultant scattering tends to be beneficial, however, as it is primarily the outgoing light which is scattered back into the plasma by the interaction. (4 refs.)

113689 The behaviour of impurities out of coronal equilibrium.

P.G.Carolan (UKAEA, Culham Lab., Abingdon, England), V.A.Piotrowicz.

Plasma Phys. (GB), vol.25, no.10, p.1065-86 (Oct. 1983).

The behaviour of a range of impurities, in the presence of neutral thermal hydrogen atoms, is examined analytically for non-equilibrium coronal conditions. The time, τ_{eq} , required for an impurity species to establish equilibrium is found to be sensitively dependent on the plasma electron temperature and is strongly correlated with the ionisation state distribution at equilibrium. Peak values of $n_{\text{eq}}\tau_{\text{eq}}\approx 2\times 10^{18}\text{ m}^{-3}\text{ s}$ are found. The temporal and ensemble averaged calculations of the impurity charge states and radiation power which are presented here allow for the treatment of impurities without recourse to lengthy computation. The impurities (carbon, oxygen, iron and molybdenum) are considered in terms of the electron temperature, the fractional neutral hydrogen concentration, and the time spent by the impurities in the plasma. (18 refs.)

113690 Nonlinear theory of standing striations in a high-frequency gaseous discharge. B.S.Kerner, V.V.Osipov.

Radio Eng. & Electron. Phys. (USA), vol.27, no.12, p.122-32 (Dec. 1982).

Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.12, p.2415-25 (Dec. 1982). [received: Sept. 1983]

The hydrodynamic theory of high-amplitude standing striations in a high-frequency discharge is developed: the shape and stability of striations as well as their evolution with changes of current are investigated. It is shown that the shape of striations is determined by the form of the dependence of ionization rate ν_i on electron concentration n and the effective temperature of the electrons T as well as on the ratio $\epsilon=|L|/L$ (L , L are lengths of bipolar diffusion and of cooling of hot electrons). The distributions $n(x)$ and $T(x)$ in striations for $\epsilon\ll 1$ are close to quasi-harmonic distributions. For $\epsilon\ll 1$ the distribution $n(x)$ represents a contrast pattern, i.e. in some regions of size $\sim l$ (in walls of striations) electron concentration sharply changes and in other regions it changes smoothly; $T(x)$ changes everywhere smoothly with length of about L that characterizes the period of striations. In addition to periodic striations, by external excitation for $\epsilon\ll 1$ one can excite more complex distributions including a distribution in the form of one striation in the region of stability of the uniform state. It was established from analysis of stability that for a given current several stable states are realized. (21 refs.)

113691 Streamer discharges in semiconductors in the temperature range 4.2-530K.

V.V.Zubritskii, G.P.Yablonskii, V.P.Gribkovskii (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.250-3 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.402-8 (March 1983). [received: Sept. 1983]

Streamer discharges were excited and investigated in cadmium sulfide and zinc selenide single crystals at temperatures 4.2-530K. It was established that on increase in temperature the streamer orientation became more definite and there was a change in the preferred crystallographic directions of discharge propagation. Surface streamers were observed in layers less than 5 μ thick. The streamer and photoluminescence spectra were determined at temperatures 4.2, 12, 300, 373, and 473K. It was found that the main mechanism of radiative transitions was recombination in an electron-hole plasma in the discharge channel. (13 refs.)

113692 Formation of an anode spot in a vacuum arc. V.A.Nemchinskii (All-Union Sci. & Tech. Res. Inst. for Current Source Design & Engng., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.146-9 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.235-40 (Feb. 1983). [received: Sept. 1983]

Processes preceding anode spot formation in a high-current vacuum arc are examined. It is shown that at currents above a threshold value I_{cr} the magnetic field induced by the current in the arc affects the arc current and the plasma flow and results in pinching of the plasma column and a region of critical plasma flow near the anode. The critical current I_{cr} agrees closely with the experimentally observed current at which the voltage across the arc rises abruptly and anode spot formation commences. This agreement is observed for copper electrodes and for electrodes consisting of other metals. The sequence of events leading to anode spot formation is discussed. (17 refs.)

113693 Causes of cathode spot motion in a vacuum arc and an estimate of retrograde velocity in a magnetic field. V.A.Nemchinskii (All-Union Sci. Res. Inst. of Current Source Design & Engng., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.150-5 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.241-50 (Feb. 1983). [received: Sept. 1983]

Cathode spots in a vacuum arc mode randomly—a spot remains stationary during its 'lifetime', after which it jumps a distance $\sim R$, where R is the spot radius, in a random direction. It is suggested that the factor responsible for spot movement is the additional voltage drop across the plasma which is required for current transmission from the eroded crater, which becomes steadily deeper while the spot remains fixed. When the voltage inside the

crater exceeds a certain value, it becomes more 'advantageous' for the arc to move onto the cooler rim of the crater. Spot jumping occurs when the arc voltage is maximal. The amplitude of the voltage oscillations ΔV_c caused by spot jumping is estimated in terms of R and τ and it is found that V_c is a few volts, in agreement with experimental findings. Retrograde spot motion in a magnetic field is analyzed and attributed to the Hall field E_H in the plasma near the cathode, which makes the cathode voltage drop symmetric. On the boundary toward which the Lorentz force $\mathbf{I} \times \mathbf{B}$ is directed, the cathode drop is $\delta V_c \approx 2E_H R$ less than on the opposite boundary. The character of the spot motion (jumps over distances $\sim R$) remains the same, but the field now gives rise to a preferred direction and the spots move backward at a velocity determined by the ratio $\delta V_c / \Delta V_c$. Experimental data on the amplitude and frequency of the arc voltage fluctuations (or else values determined from R and τ) are used to estimate the retrograde velocity in a weak field, B_{sat} (the magnetic field at which the velocity 'saturates'), and the absolute value v_{sat} of the saturated velocity. The findings are compared with experimental data for arcs with copper, molybdenum, or stainless steel electrodes, and a satisfactory agreement is obtained. (36 refs.)

113694 Observation of a significant density of negative ions in a currentless discharge in air; the possibility of an attachment instability. A.S.Zarin, V.N.Kulikov, V.E.Mitsuk (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.590 (Nov. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1373-4 (Nov. 1982). [received: Sept. 1983]

Reports direct measurements of the electron density n_e , the negative-ion density n_n , and the ratio $\eta = n_n/n_e$ for pressures in the range 10^{-2} -20 torr in an RF discharge in air. (8 refs.)

113695 Observations of the development processes of the discharges in the air gaps with insulating barrier arrangements. T.Hirano (Dept. of Electrical Engng., Nat. Defense Acad., Yokosuka, Japan). *Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan)*, vol.20, no.2, p.125-44 (June 1982). In Japanese. [received: Aug. 1983]

The development processes of discharges in air gaps between rod-to-rod and rod-to-plane electrodes with acrylic insulating plate barriers arranged at right angles to the rod electrode have been observed using a still camera and a lightning impulse voltage-chopping method. The development of the positive streamers and leaders is suppressed with the positive electric charges accumulated on the surface of one barrier of 400 mm in width. A solid angle of the positive discharges at the tip of the rod electrode with the barrier is larger than that without any barrier. The flashover paths with the barrier have gas discharge and surface discharge types. In the case of two barriers joined (probably with a small crack), it is found that the streamer and leader strokes can easily pass through the crack. (13 refs.)

113696 Stereographic representation of three-dimensional density distributions. M.Van Heel (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany). *Ultramicroscopy (Netherlands)*, vol.11, no.4, p.307-13 (1983). The representation of three-dimensional density data in a manner that is transparent to the human observer is a problem that has a number of solutions. All solutions rely on the definition of one or more 'surfaces' ('contours') in the 3D data set which are presented to the observer in one way or another. The algorithm promoted by the author allows the calculation of 'photographs of the model' without building a model. The technique allows rapid visual evaluation of results of 3D reconstructions at various density levels. Apart from being time-saving, this procedure has the advantage that the models need not be buildable, that is, the object may consist of subunits that do not touch each other at all; connectivity is not needed as nothing has to be glued together. (10 refs.)

(see also 61.80 Radiation damage and other irradiation effects; for specific determinations, see 61.55 to 61.80)

61.10D Theories of diffraction and scattering

113697 Remarks on the nature of the X-ray diffraction line profiles due to small crystallite size. G.B.Mitra, P.S.Mukherjee (Dept. of Phys., Indian Inst. of Technol., Kharagpur, India).

Indian J. Phys. Part A, vol.57A, no.3, p.143-54 (May 1983). Gaussian and Cauchy approximation for X-ray diffraction line profiles due to small crystallite size have been critically discussed. The effects of these approximations on the profile parameters, viz. integral width, Fourier coefficients, variance and fourth moment have been discussed. Expression for variance and fourth moment of X-ray diffraction line profile derived for the general case by Wilson (1963) and Mitra (1964) have been examined. It has been found that a Cauchy approximation is more realistic than Gaussian approximation for a X-ray diffraction line profile due to small crystallite size. (20 refs.)

113698 Dynamic diffraction of X-rays in a harmonic superlattice. Yu.P.Khapachev, G.F.Kuznetsov (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.12-14 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.27-31 (Jan.-Feb. 1983). [received: Sept. 1983] The authors discuss the dynamic diffraction of X-rays in a harmonic superlattice. They show that in general the widths of the satellites are unequal to one another and to the width of the main diffraction maximum. They give experimental results which support the theory. (4 refs.)

113699 A completely probabilistic approach to the determination of centrosymmetric structures. A.N.Chekhlov (Inst. of Physiologically Active Substances, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.19-21 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.42-6 (Jan.-Feb. 1983). [received: Sept. 1983] For centrosymmetric crystals, new probabilistic expressions are derived, permitting iterative calculation not only of the signs of the reflections but also of their probabilities, making the multivariant procedure of solving the phase problem more reliable and objective. This completely probabilistic approach is realized in the crystallographic program complex LUCH-77, compiled by the author, and is used to determine several fairly complex structure. (6 refs.)

113700 The difference interatomic function $D(u)$. I. Definition and characteristics of peaks. E.V.Slavyanov, V.N.Biyushkin (Inst. of Appl. Phys., Acad. of Sci., Moldavian SSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.22-4 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.47-50 (Jan.-Feb. 1983). [received: Sept. 1983] The function $D(u)$ is defined as the difference between the modified and ordinary Patterson functions, reduced to a definite relative scale. The function enables the authors to distinguish or eliminate the interatomic vectors corresponding to a given species of atoms. The peak weightings of the function depend on the relative scales or the functions in the subtraction and may be either positive, zero, or negative. (3 refs.)

Symmetry of phase space and direct methods of X-ray structural analysis of crystals See Entry 113703

(inc. apparatus, techniques and calculation methods for analyzing experimental results; see also 07.85 X-ray, gamma-ray instruments and techniques)

113701 A note on the reproducibility of experimental radial distribution functions. G.Hermes, M.Derno, H.Steil (Sektion Phys., Wilhelm-Pieck-Univ. Rostock, Rostock, Germany).

Chem. Scr. (Sweden), vol.22, no.3, p.155-6 (1983). An example is given showing the good reproducibility in modern X-ray diffraction studies on amorphous materials even if specimens of different form (powder and bulk materials) are used. (9 refs.)

113702 On the evaluations of Fourier coefficients in X-ray line profile analysis of crystalline materials. E.Chatterjee, S.P.Sen Gupta (Dept. of General Phys. & X-rays, Indian Assoc. for the Cultivation of Sci., Calcutta, India).

Indian J. Phys. Part A, vol.57A, no.3, p.200-4 (May 1983). X-ray diffraction line profile analysis (XRDLPA) using Warren-Averbach's Fourier method (1969) is well known for its wide application in the evaluations of microstructural parameters in polycrystalline materials in terms of lattice imperfections, namely small coherently diffracting domains or crystallites, root-mean-square strains in these crystallites, stacking fault concentrations, etc. In this analysis, the true diffraction profile originating from imperfections in the materials is unfolded from the experimentally recorded profile of the sample and the instrumental profile of the standard through Stokes' method of deconvolution (1948). (3 refs.)

113703 Symmetry of phase space and direct methods of X-ray structural analysis of crystals. V.A.Koptsik, E.N.Ovchinnikova, A.Yu.Papaev (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.14-19 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.32-41 (Jan.-Feb. 1983). [received: Sept. 1983] The authors discuss the problem of mapping the symmetry of physical space into the space of structure amplitudes (Fourier space). The symmetry of phase space, for which the geometrical basis is the reciprocal lattice consisting of points (hkl) while the weightings are the assigned structure amplitudes $a(hkl)$, is a positional $G^{(w)}$ color symmetry. The authors derive the 156 point groups of $G^{(w)}$ symmetry into which tetragonal, hexagonal, and cubic Fedorov groups Φ are mapped. It is shown that reciprocal space also has translational color symmetry, so that the Fedorov groups Φ can be mapped into the spatial color groups $\Phi|_{\alpha}^{w(F),w(\alpha)}$. (24 refs.)

113704 Programs for indexing powder patterns. V.A.Zabolotnyi, V.E.Ovchinnikov, L.P.Solov'eva, B.M.Shchedrin (Inst. of Tectonics & Geophys. of the Far-Eastern Sci. Center, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.24-6 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.51-5 (Jan.-Feb. 1983). [received: Sept. 1983]

An algorithm is developed for finding lattice parameters from powder data; it is suitable for realization on small and medium-sized computers. The algorithm is based on representing the indexing problem as a problem of minimization of the sum of the discrepancies of the ratios of the interplanar distances. (10 refs.)

113705 Two approaches to the interpretation of X-ray investigations of liquids. T.V.Gorbulova, G.I.Batalin (State Univ., Kiev, Ukrainian SSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.27-30 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.56-61 (Jan.-Feb. 1983). [received: Sept. 1983]

The authors discuss two approaches to the interpretation of X-ray diffraction experiments on liquids: calculation of theoretical intensity curves, and of atomic radial distribution curves (RDC) for short-range order models. They show that comparison between the experimental and theoretical RDC in the region of short-range order enables the authors to select the most probable model for the structure of the ordered regions. Comparison of the intensity (structure factor) curves is less suitable for this purpose, because it is not possible to distinguish the contributions made to these curves by the individual interatomic distances. (4 refs.)

113706 A new method for calculating the intensity of the diffuse X-ray scattering by point defects in cubic crystals. W.Kienle, A.Seiger, W.Frank (Max-Planck-Inst. für Metall., Stuttgart, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.228-31

Homogeneously distributed point defects in a cubic crystal give rise to diffuse X-ray scattering with cubic symmetry in k space. This allows one to expand the single-defect approximation of the diffuse X-ray intensity in an alternating series of cubic harmonics. In contrast to the usual approximations valid in the regimes of small-angle and Huang scattering, this series is a good approximation in the entire k space. The method is illustrated for monovacancies in a face-centred cubic crystal. (7 refs.)

113707 The importance of beam alignment and crystal tilt in high resolution electron microscopy. D.J.Smith, W.O.Saxton, M.A.O'Keefe, G.J.Wood, W.M.Stobbs (High Resolution Electron Microscope, Univ. of Cambridge, Cambridge, England).

Ultramicroscopy (Netherlands), vol.11, no.4, p.263-81 (1983).

The relative influences of crystal tilt and beam alignment on high-resolution electron-microscopic imaging have been investigated. With the use of contrast transfer theory in generalised dimensionless form, the major effect of slight beam misalignment has been shown to be the introduction of an antisymmetric phase shift in the diffracted beams so that the presence of any such misalignment cannot be detected by the standard diagnostic tool of high-resolution electron microscopy, namely the optical diffractogram. Specific image simulations, at 100 and 500 keV, for materials of both small and large unit cells (SnO_2 and $Ti_2Nb_{10}O_{29}$ respectively) show, however, that even slight beam tilt can have a marked effect on the images of crystalline materials, causing considerable spurious detail and a loss of expected symmetry. The various options for ensuring accurate beam and crystal alignment are briefly reviewed, and some aspects of the alignment problems are demonstrated using some recent experimental images recorded at 500 kV. (30 refs.)

113708 Real space image simulation in high resolution electron microscopy. R.Kilaas, R.Gronsky (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Ultramicroscopy (Netherlands), vol.11, no.4, p.289-98 (1983).

The validity of a new method for simulating high resolution electron microscope images has been critically examined. This method, which has been termed the real space method since the entire calculation is performed without any Fourier transforms, offers a considerable reduction in computing time over the conventional multislice approach when identical sampling conditions are employed. However, for the same level of accuracy the real space method requires more sampling points and more computing time than the conventional multislice method. These characteristics are illustrated with calculated results using both methods to identify practical limitations. (9 refs.)

113709 Microstructure and topography [laser annealing of semiconductors]. A.G.Cullis (Royal Signals & Radar Establ., Great Malvern, England). In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.147-201. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

A wide variety of physical analytical techniques have been employed in the study of annealed layer structures, and perhaps the most widely used method is Rutherford backscattering and channeling of megaelectron volt ions. However, this does not give direct information about individual crystallographic defects that may be present, and, for this purpose, electron microscopy is unrivalled. The author reviews mainly the results of transmission electron microscope (TEM) investigations in revealing the microstructural properties of annealed layers. In many cases conventional plan view specimens have been adequate to show details of interest. However, the layers often exhibit a defect depth stratification that can be revealed satisfactorily only by use of cross-sectional specimens. Such work has the additional advantage that the final micrographs can be compared directly with the results of ion-backscattering studies. (126 refs.)

113710 The use of ^{29}Si Fourier transform nuclear magnetic resonance spectroscopy for the characterisation of polymers and paints. G.L.Marshall (Materials Quality Assurance Directorate, London, England). *Br. Polym. J. (GB)*, vol.14, no.1, p.19-22 (March 1982).

A range of commercial paint binders and two-pack elastomers containing silicone materials have been investigated by ^{29}Si Fourier transform nuclear magnetic resonance spectroscopy at 17.76 MHz. In order to obtain good quality spectra within a minimum of time period, a relaxation agent was used to suppress nuclear Overhauser effects, and to improve the relaxation times of the silicon nuclei. (12 refs.)

61.20 CLASSICAL, SEMICLASSICAL, AND QUANTUM THEORIES OF LIQUID STRUCTURE

(for kinetic and transport theory, see 51.10; for electronic states, see 71.; for liquid helium, see 67.)

113711 Lattice theory of binary fluid mixtures: phase diagrams with upper and lower critical solution points from a renormalization-group calculation. J.S.Walker (Dept. of Phys., MIT, Cambridge, MA, USA), C.A.Vause. *J. Chem. Phys. (USA)*, vol.79, no.6, p.2660-76 (15 Sept. 1983).

A generalized lattice model representing the interaction between two molecular species in a binary liquid mixture is introduced. The model interaction potential consists of a highly directionally dependent orientational part, due to hydrogen bonding, coupled to the configurational van der Waals interaction. Closed-loop temperature vs. concentration solubility phase diagrams are produced in good agreement with experimental systems. These diagrams are obtained using renormalization-group methods. The possible types of phase diagrams predicted by the phenomenological Landau theory are also discussed. (39 refs.)

113712 The density profile of a fluid bounded by a soft wall. J.K.Percus (Phys. Dept., New York Univ., New York, NY, USA), G.O.Williams. *J. Chem. Phys. (USA)*, vol.79, no.6, p.3009-17 (15 Sept. 1983).

An approximate relationship is developed between the density profile of a simple classical fluid bounded by a soft wall and that bounded by an idealized hard wall. This relationship is exact for a class of one-dimensional fluids, and also constitutes a simplification of the 'shielding approximation'. It accurately reproduces several Monte Carlo calculations. (16 refs.)

113713 Equilibrium properties of the Gaussian overlap fluid. Monte Carlo simulation and thermodynamic perturbation theory. P.A.Monson, K.E.Gubbins (School of Chem. Engng., Cornell Univ., Ithaca, NY, USA). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2852-8 (21 July 1983).

The structure and thermodynamic properties of fluids of molecules interacting with a Gaussian overlap potential are calculated by Monte Carlo (MC) simulation and thermodynamic perturbation theory. Both prolate and oblate molecules are considered. The perturbation theory is based on an extension of the Weeks-Chandler-Andersen (WCA) theory to orientation-dependent potentials and uses a Mayer-function expansion about a spherically averaged reference potential to compute the structure of the hard-core reference system. The theory predicts the structural features of the fluid quite accurately except for the most anisotropic system at high density. The thermodynamic properties are given quite accurately by the theory for mildly anisotropic molecules, but the agreement is only qualitative for the most anisotropic case. The molecular shape dependence of the orientational correlation parameter G_2 has been studied for the hard-core Gaussian overlap potential, using the computer simulation results. Large positive values of G_2 are reported for an oblate system at high density. (23 refs.)

61.25 STUDIES OF SPECIFIC LIQUID STRUCTURES

(see also 61.40 Amorphous and polymeric materials)

113714 Evidence of compatibility in the melt for poly(ethylene oxide)/poly(methyl methacrylate) blends by ^{13}C n.m.r. investigations. E.Martuscelli, G.Demma (Istituto di Ricerche su Tecnologia dei Polimeri e Reologia, Napoli, Italy), E.Rossi, A.L.Segre. *Polym. Commun. (GB)*, vol.24, no.9, p.266-7 (Sept. 1983).

Evidence of compatibility in the melt for poly(ethylene oxide) PEO and poly(methyl methacrylate) PMMA was obtained in Martuscelli et al. (1980) while studying the crystallization and thermal behaviour and the wide- and small-angle X-ray scattering of corresponding binary blends. The present authors report preliminary results concerning a ^{13}C n.m.r. study of PEO/PMMA blends in the melt state with particular attention to the dynamic parameters. In the case of mixability, the ^{13}C dynamic parameters are composition dependent due to molecular entangling effects and to variations of chain mobility. In fact, both in the melt (90°C) and in the supercooled melt (60°C), T_g is strongly composition dependent, i.e. 840 to 240 ms at 90°C and 283 to 168 ms at 60°C, going from pure PEO to the 1:1 blend. This result is interpreted as being due to complete mixability in the melt of PEO and PMMA. (7 refs.)

113715 Inherent structure in water. F.H.Stillinger, T.A.Weber (Bell Labs., Murray Hill, NJ, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2833-40 (21 July 1983). The statistical thermodynamics of water has been recast in a form which distinguishes two basic contributions, one of purely structural origin, and one due to anharmonic vibrations. The former involves the collection of potential energy minima ('inherent structures') while the latter concerns thermal motions away from these minima. Information about the inherent structures has been adduced from crystallography and from molecular dynamics simulation for a 250-molecule cluster with free surfaces. The authors concluded that near 0°C the mean molar volume of relevant inherent structures contributing to the liquid phase increases as temperature decreases, and that this increase probably has a singularity at the supercooling limit due to cooperative aggregation of hydrogen-bond polyhedra. Approximately 85-90% of the latent heat of melting ice can be attributed to upward shift in potential energy of the inherent structures across the transition, the remainder to changing anharmonicity. (35 refs.)

113716 The role of attractive force on the behavior of a polymer chain in solution. Seung Ho Jeon, In Joon Oh, Talkyue Ree (Dept. of Chem., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).

J. Phys. Chem. (USA), vol.87, no.15, p.2890-4 (21 July 1983). The authors investigated the behavior of a polymer chain in solution by the molecular dynamics (MD) technique. For this purpose, the polymer was represented by a semirigid chain having a fixed bond length and bond angle with allowance for a hindered internal rotation. The interaction potentials for solvent-solvent (SS), chain-solvent (CS), and chain-chain (CC) particles were chosen to be an exp-6 potential form, with a provision that the CC potential acts only between nonnearest-neighbor particle pairs. The effect of the attractive interactions on the physical properties of the polymer was investigated by comparing the results based on the exp-6 potentials with those based on a 'shifted' exp-6 potential which includes only the repulsive part of the exp-6 potential. The present work includes the calculations on the equilibrium quantities such as the SS, CS, and CC pair correlation functions, the mean square end-to-end distance, the mean square radius of gyration, and the eigenvalues of the moment of inertia tensor as well as the dynamic properties such as the autocorrelation functions for the mean square end-to-end distance and the mean square radius of gyration. The calculations show that the polymer configuration depends sensitively not only on the repulsive interaction but also on the attractive interaction. Namely, omitting the attractive term makes the polymer more compact, making the gauche conformations more favorable than trans conformations. The attractive interaction also produces autocorrelation functions which decay slower than those for the pure repulsive potential. (29 refs.)

113717 Raman scattering from molten alkali iodides. C.Raptis, R.A.J.Bunten, E.W.J.Mitchell (Clarendon Lab., Univ. of Oxford, Oxford, England).

J. Phys. C (GB), vol.16, no.27, p.5351-62 (30 Sept. 1983). Polarised and depolarised light scattering spectra of molten Na, K, Rb and Cs iodides have been measured at about 35° above the melting point in the range of frequency shifts (ν) of 4-350 cm^{-1} (0.5-45 meV). All polarised spectra show a broad shoulder centred about the mid-point of each frequency spectrum, a feature that is not observed in the depolarised spectra. The resulting depolarisation ratio (ρ_d) spectra show values of ρ_d increasing in the sequence NaI, KI, RbI to CsI, while the frequencies at peak positions in the reduced-intensity spectra decrease in the same sequence and are in close agreement with the Debye temperatures of the solids. Comparisons of the results are made with those from alkali chlorides and bromides reported previously. (19 refs.)

113718 X-ray diffraction investigation of the structure of liquid and supercritical water at high temperatures and pressures. I. Molecular functions of structurally sensitive scattering components at a pressure of 1000 bars and temperatures from 298 to 773K. Yu.E.Gorbatyi, Yu.N.Dem'yanets (Inst. of Experimental Mineralogy, Acad. of Sci., Chernogolovka, USSR).

J. Struct. Chem. (USA), vol.23, no.6, p.882-94 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.73-85 (Nov.-Dec. 1982). [received: Sept. 1983] Using an experimental technique based on energy-dispersive X-ray diffraction, the authors have determined the molecular functions for structurally-sensitive components of the scattering of X-ray beams in liquid and supercritical phases of water at a constant pressure of 1000 bars and temperatures from 298 to 773K. The authors describe the experimental technique and the basic procedures for treatment of the experimental data. The final results are given in the form of tables which may be used to calculate correlation functions. (16 refs.)

113719 Studies on dilute solutions of rodlike macroions. I. Light scattering, densitometry, and cryoscopy. C.C.Lee, S.-G.Chu, G.C.Berry (Dept. of Chem., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1573-97 (Sept. 1983). Total integrated and photon correlation light scattering have been used to study two samples of poly(1,4-phenylene-2,6-benzobisthiazole) (PBT) representing two methods of precipitation to recover the polymer from the polymerization solvent. Some details of the light-scattering instrument are given. It is found that the PBT sample is rodlike, with persistence length of at least 50 nm, but that the postpolymerization processing method influences the state of interchain aggregation. The data are augmented by measurements of freezing-point depression to estimate the degree of protonation of PBT in

sulfuric acid, and by measurements of partial specific volume to provide an estimate for the geometric diameter of the chain in solution. The results show a degree of protonation of 2-4 protons per repeating unit, and partial specific volumes that are appreciably smaller than the specific volume determined for the polymers. Similar data and results are reported for poly(1,4-phenylene-2,6-benzobisoxazole) and poly(1,4-phenylene terephthalamide). (25 refs.)

113720 The application of neutron scattering methods to aqueous electrolyte solutions. G.W.Neilson (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).

Physica B & C (Netherlands), vol.120B+C, no.1-3, p.325-34 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

The author reviews recent developments in the application of neutron diffraction and quasi-elastic neutron scattering (QNS) to aqueous electrolyte solutions. The diffraction studies are based on the method isotopic differences which facilitates the extraction of detailed information regarding ionic hydration and ion-ion correlations respectively. The QNS results are derived from data obtained from the IN10 back scattering spectrometer of the ILL. IN10 provides a range of energy and momentum transfer ideal for studies of aqueous systems. The structural and dynamical information obtained from these investigations provide a series of crucial tests of liquid state theories and theoretical models currently used in solution science. Two models are discussed: the Frank-Wen dynamical model of ionic solution and the primitive model of ion-ion structure. (29 refs.)

113721 Many-body effects in the structure of water. P.A.Egelstaff (Tohoku Univ., Sendai, Japan).

Physica B & C (Netherlands), vol.120B+C, no.1-3, p.335-41 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

Non-additive forces are believed to be important in the case of water because they are involved in the formation of 'hydrogen bonds'. The influence this has on the microscopic structure of the liquid is shown to lead to unusual effects in the isochoric temperature derivative of the neutron and X-ray structure factors. A new method of measuring these derivatives is described and recent published work using this method will be interpreted in terms of non-additive many-body effects. (11 refs.)

113722 Melt flow of polymer blends. L.A.Utracki (Nat. Res. Council of Canada, Industrial Materials Res. Inst., Montreal, Quebec, Canada).

Polym. Eng. & Sci. (USA), vol.23, no.11, p.602-9 (mid-Aug. 1983).

The results published during the last five years are reviewed. The data for polymer blends are compared with those obtained for simpler model systems: liquid mixtures, emulsions, and polymer blends. From the rheological point of view, the blends are divided into three groups: those where viscosity shows positive deviation from the log-additivity rule, PDB, those where the opposite effect is observed, NDB, and the remaining mixed-behavior systems, PNDB. To PDB belong the miscible blends and those with strong inter-domain interactions. To NDB belong those where the interactions are weak. To PNDB belong the blends in which there is a concentration-dependent transition of structure. The shear dependent properties of blends are also discussed. (87 refs.)

113723 A phenomenological master curve for viscosity-structure data for two phase polymer systems in simple shear flow. J.Lyngaae-Jorgensen (Inst. for Kemindustri, Tech. Univ. of Denmark, Lyngby, Denmark).

Polym. Eng. & Sci. (USA), vol.23, no.11, p.610-13 (mid-Aug. 1983).

A master curve hypothesis is established based on a mass balance and an assumption of continuous stress through interfaces for well dispersed two phase systems with 'defined' zero shear viscosity. The master curve, which is in reasonable accordance with experimental data is represented in a double logarithmic plot. M_c is the molecular weight between entanglements, $H = M_w/M_n$, ρ is the density, c is the polymer concentration, all defined for the continuous phase. η_r and $G_{H,0}$ are the viscosity and zero shear viscosity of the blend, $\dot{\gamma}_r$ is the apparent shear rate, R is the gas constant, and T is the absolute temperature. (18 refs.)

113724 Competitive equilibria in miscible polymer blends and low molecular weight analogues: a Fourier transform infrared study. A.Garton (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Canada).

Polym. Eng. & Sci. (USA), vol.23, no.12, p.663-8 (Aug. 1983).

The relative magnitudes of specific interactions are compared by setting up competitive equilibria in mixed solvent systems. The positions of the equilibria are determined spectroscopically by resolving the overlapping absorptions of the two solvation states. This technique is applied to the study of interactions between polyesters (or model compounds) and a variety of solvents which mimic possible interacting centers in halogenated polymers. Using the same technique of resolving overlapping bands, it is also demonstrated that in a miscible blend of polycaprolactone and Phenoxy (a polyhydroxyether of bisphenol A) only a relatively small proportion of carbonyl groups of polycaprolactone are involved in specific interactions with the Phenoxy. (15 refs.)

113725 Fourier transform infrared studies of poly(vinyl chloride) blends with ethylene co- and terpolymers. M.Iskandar, C.Tran, L.M.Robeson, J.E.McGrath (Dept. of Chem. & Polymer Materials & Interfaces Lab., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

Polym. Eng. & Sci. (USA), vol.23, no.12, p.682-8 (Aug. 1983).

The miscibility of poly(vinyl chloride) (PVC) with various ethylene copolymers and terpolymers were investigated using FT-IR spectroscopy. All blends reported were 50/50 by weight. In blends of PVC with ethylene/dimethyl acrylamide copolymer (E/DMA), frequency shifts were observed in the amide carbonyl (proton acceptor) and the α -hydrogen of PVC (proton donor) characteristic bands. In blends of PVC with ethylene/ethyl acrylate/carbon monoxide terpolymer (E/EA/CO), both the ester carbonyl and the ketone carbonyl characteristic frequencies showed mutual shifts and appeared as if they merged together. Small frequency shifts were also observed in the α -hydrogen of PVC characteristic bands. In blends of PVC with ethylene/vinyl acetate/carbon monoxide terpolymer (E/VA/CO), the ester carbonyl frequency showed a shift while that of the ketone carbonyl was essentially unchanged. On the other hand, in PVC blends with ethylene/vinyl acetate copolymer (E/VA), the ester CO frequency did not show any shift, which is consistent with their observed immiscibility. Thus, it is clear that incorporating a ketone -C=O in ethylene/ester copolymers to form the corresponding terpolymers enhances their miscibility with PVC as earlier proposed on the basis of dynamic mechanical studies. Similar results were shown for blends of PVC with ethylene/2 ethyl hexyl acrylate/carbon monoxide terpolymer (E/2EHA/CO). Frequency shifts imply specific interactions which suggest polymer-polymer miscibility on a molecular scale. (15 refs.)

113726 Fluorescence study of polymer chain interpenetration and of the rate of phase separation in incompatible polymer blends. H.Morawetz (Polymer Res. Inst., Polytech. Inst. of New York, New York, NY, USA).

Polym. Eng. & Sci. (USA), vol.23, no.12, p.689-92 (Aug. 1983).

The application of fluorescence techniques has been demonstrated for the study of four polymer problems: (a) If two different polymers are labeled

with donor and acceptor fluorophores, respectively, which exhibit nonradiative energy transfer, the emission spectrum of their blends will depend on whether the two polymeric species are miscible or segregated into separate phases. Thus, the emission spectrum may be used as a measure of polymer compatibility. (b) Since rapid freeze-drying preserves the extent of chain interpenetration which existed in solution, the energy transfer between labeled polymers may be used to study the extent of such interpenetration on solution concentration. (c) Phase separation when heating blends of poly(methyl methacrylate) and poly(benzyl methacrylate) may be followed by the change in the emission spectrum of the latter. (d) The interdiffusion of separated poly(ethyl methacrylate) molecules labeled with donor and acceptor fluorophores may be monitored by the increase in the nonradiative energy transfer. (16 refs.)

113727 Domain stability during capillary flow of well dispersed two phase polymer blends. Polystyrene/polymethylmethacrylate blends. J.Lyngaae-Jorgensen, F.E.Andersen, N.Alle (Inst. for Kemiindustri, Tech. Univ. of Denmark, Lyngby, Denmark).

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.105-47

A hypothesis for domain stability, i.e. the conditions where each domain of a dispersed phase remains as a coherent domain during capillary flow, is tested with data for polystyrene-polymethylmethacrylate melts. It is found that stable domains exist when the ratio between the (Trouton) zero shear viscosity of the discrete phase to the continuous phase is larger than approximately one. Blends of two thermodynamically incompatible polymers, polystyrene (PS) and poly(methylmethacrylate) (PMMA), were melt blended in a Brabender Plasticorder over the compositions: 100% PS, 75%, 50%, 25% and 0% PS. Viscous and die swell behaviour of pure polymers and the blends at different temperature were obtained using an Instron capillary rheometer and the microstructure of the melt blends was studied by transmission electron-microscopy. (47 refs.)

113728 Shape control of non-metallic inclusions in Al-deoxidized steel by calcium treatment. K.S.Kim, J.D.Shim (Korean Advanced Inst. of Sci. Technol., Seoul, Korea), W.J.Lee, J.K.Yoon.

J. Korean Inst. Met., vol.21, no.6, p.548-57 (June 1983). In Korean.

In order to clarify the shape control mechanism of nonmetallic inclusions in molten steel, the morphology changes of oxide and sulfide inclusions were investigated by Ca treatment in Al-deoxidized steel at 1600°C. The Ca addition of a suitable amount into Al-deoxidized steel considerably improved the degree of steel cleanliness because the alumina cluster formed after Al-deoxidization changed to liquid phase calcium-aluminates which float out rapidly from steel bath. Also, when the total oxygen content in molten steel was less than about 20 ppm, MnS sulfide and Al_2O_3 oxide were modified to C type inclusions such as $(\text{Ca},\text{Al},\text{Mn})\text{O}-(\text{Ca},\text{Mn})\text{S}$ or $\text{CaO}-\text{Al}_2\text{O}_3-\text{CaS}$. (12 refs.)

113729 Modeling the radial distribution function of liquid gallium based on the quasicrystalline model. N.N.Medvedev, Yu.I.Naberukhin, I.Yu.Semenova (Inst. of Chem. Kinetics & Combustion, Acad. of Sci., USSR).

J. Struct. Chem. (USA), vol.23, no.6, p.876-82 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.66-72 (Nov.-Dec. 1982). [received: Sept. 1983]

The authors attempt to describe the radial distribution function of liquid gallium within the framework of the quasicrystalline model. They show that the structures of the α and β crystalline forms of gallium do not describe the radial distribution function of the liquid. A better description of the function over the entire available experimental range of separations (beyond the first peak) is obtained if the model is based on a modified bcc lattice in which the central atom is displaced along the diagonal. The authors conclude that the structure of liquid gallium involves irregular close packing in which separate pairs of atoms are closer than the average separation between particles. (25 refs.)

61.30 LIQUID CRYSTALS

(see also 64.70M Transitions in liquid crystals)

113730 New liquid crystalline tetrazine derivatives for guest-host displays. A.Isenberg, B.Krucke, G.Pelzl, H.Zaschke, D.Demus (Sektion Chem., Martin-Luther-Univ., Halle-Wittenberg, Germany).

Cry. Res. & Technol. (Germany), vol.18, no.8, p.1059-68 (1983). A number of new liquid crystalline tetrazine derivatives was synthesized. The electro-optical studies showed that the 3-n-alkyl-6-[4-(4-n-alkyl-cyclohexanoyloxy)phenyl]-1,2,4,5-tetrazines are excellent dyes for guest-host displays with positive colour contrast. (17 refs.)

113731 Cause of coherent oscillation of domains of nematic liquid crystals in DC electric field. S.Hirata, T.Tako (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1073-9 (July 1983). The domains of nematic liquid crystals begin to oscillate coherently at a certain threshold voltage in a DC electric field. The structures of the hydrodynamic motion and the molecular alignment of this oscillation are investi-

gated and its mechanism is explained. The oscillation is attributed to the time-dependent competition between the hydrodynamic instability and the elastic stability in a nonequilibrium system. Some features of the oscillation are discussed on the basis of this mechanism. (10 refs.)

113732 Ferroelectric liquid crystals and their applications. L.K.Vistin', I.I.Sakharova, S.S.Yakovenko (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Inorg. Mater. (USA), vol.18, no.10, p.1420-5 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1656-61 (Oct. 1982). [received: Sept. 1983]

The problem of ferroelectricity in liquid crystals is briefly analyzed. Electrostructural transitions in chiral smectics and electrooptical effects accompanying these transitions are studied. It was shown that the electrooptical effects can be used to modulate light over a wide range of frequencies. (14 refs.)

113733 Submillisecond grating diffractions in nematic liquid crystal films. I.C.Khoo, S.Shepard (Dept. of Phys. & Astron., Wayne State Univ., Detroit, MI, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5491-3 (Sept. 1983).

The authors have quantitatively observed a large fast component in the laser induced thermal grating in nematic liquid crystal films. This effect can be successfully utilized in submillisecond and high spatial frequency four wave mixing processes with low power lasers. (10 refs.)

113734 Liquid-crystalline copolyesters based on poly(p-oxybenzoate) and poly(p,p-biphenylene terephthalate). W.Volksen, J.R.Lyerla, Jr., J.Economy, B.Dawson (IBM Res., San Jose, CA, USA).

J. Polym. Sci. Polym. Chem. Ed. (USA), vol.21, no.8, p.2249-59 (Aug. 1983).

Two copolymers composed of p-hydroxybenzoate (PHB) and biphenylene terephthalate (BPT) with PHB/BPT ratios of 1/2 and 2/1 were characterized with respect to their tendency to exhibit liquid-crystalline behaviour in the melt phase. The BPT-rich copolyester, PHB/BPT=1/2, displayed a birefringent melt phase of very high viscosity and no tendency to crystallize on cooling. The resulting fused material exhibited what appeared to be a second-order transition at 170°C. The PHB-rich composition, PHB/BPT=2/1, also exhibited a highly birefringent melt phase of high viscosity which was quite shear sensitive. This polymer melt has little tendency to crystallize on cooling; however, on reheating no apparent second-order transition could be detected. The observed phase changes were characterized by differential scanning calorimetry, hot-stage microscopy, and wide-angle X-ray diffraction techniques. Additional data, pertaining to the compositional nature and apparent sequence distribution, were obtained by ^{13}C -NMR spectroscopy of the solid materials through magic-angle spinning, dipolar decoupling, and cross-polarization techniques. (15 refs.)

113735 Thermotropic homopolymers. III. Preparation and properties of polymers based on 4'-hydroxyphenyl-4-hydroxycinnamate. W.R.Krigbaum, T.Ishikawa, J.Watanabe, H.Toriumi, K.Kubota (Gross Chem. Lab., Duke Univ., Durham, NC, USA), J.Preston.

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1851-72 (Sept. 1983).

Low-molecular-weight 4'-acetoxyphenyl-4-acetoxycinnamate, as well as several polyesters synthesized from this monomer and aliphatic dibasic acids, exhibit thermotropic nematic phases. DSC heating curves for all the polymers exhibit multiple transitions. The amount of crystallinity of the polymers at room temperature is small and the degree of order along the chain axis in the crystalline phase is poor. For the lower homologues the nematic phase exists over a broad temperature range of approximately 100°C. The polyester from chiral (+)-3-methyl adipate forms a thermotropic cholesteric phase. Both the diacetoxy monomer and azelate polymers of low molecular weight adopt the homeotropic texture on glass slides, but with increasing molecular weight the planar texture becomes preferred. Investigation of the effects of electric fields in the conduction regime upon the nematic phase of the diacetoxy monomer revealed that Williams domains are formed only with difficulty. In most cases, a stationary pattern appeared instead. At higher voltage the dynamic mode (DSM) was obtained, and above this a field-induced transition to the isotropic phase. (19 refs.)

113736 Microscopy and deuterium NMR studies on induced cholesteric lyotropic mesophases of potassium laurate. M.R.Alcantara, M.V.M.C.De Melo, V.R.Paoli, J.A.Vanin (Inst. de Quimica, Univ. de Sao Paulo, Sao Paulo, Brazil).

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.299-307 (1983).

Induced cholesteric lyotropic mesophases can be formed by the addition of cholesterol to 'nematic' phases of potassium laurate/n-decanol/water and electrolyte. The resulting mesophases are oriented by magnetic fields, the helical axes being collinear with the field (type II) or perpendicular to it (type I). The associated patterns depended on the mesophase type and on the applied field direction. The usual chevron and focal-conic textures were seen in type II cholesteric mesophases. More complex disclinations were exhibited by type I cholesteric phases. The comparison between the relative order profiles for type I and type II mesophases, nematic and cholesteric, obtained by deuterium NMR, shows that great distortions are not present in the micelles of the cholesteric systems. The overall picture suggests that mainly electrostatic interactions are responsible for the cholesteric properties in induced mesophases. (35 refs.)

113737 Dependence of the tilt angle on external forces for smectic-C and chiral smectic-C liquid crystals—measurement of the heat capacity of DOBAMBC. T.Carlssohn (Inst. of Theoretical Phys., Chalmers Univ. of Technol., Goteborg, Sweden), I.Dahl.

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.373-400 (1983).

A measurement of the specific heat of DOBAMBC is presented, and it is shown that a Landau expansion of the free-energy density with a sixth-order term is adequate to describe the measurement. The coefficients in the Landau expansion are estimated from this measurement. The dependence of the tilt angle on applied electric and magnetic fields is discussed for both smectic-C and chiral (ferroelectric) smectic-C liquid crystals. Numerical estimates of the Landau coefficients are used to show that the effect of external forces on the tilt angle is negligible except when being less than approximately 0.2K from the transition to the smectic-A-phase. The effect on the smectic-C-smectic-A phase-transition temperature is also discussed. Boundary effects can also affect the tilt angle, and an expression for the penetration depth of a boundary-induced disturbance is calculated. For thin, planar samples, a coupling between the two boundaries can induce a transition to the smectic-A phase. It is demonstrated that this transition is analogous to the ordinary Freederickz transition in nematic liquid crystals. (20 refs.)

61.40 AMORPHOUS AND POLYMERIC MATERIALS

(see also 64.70P Glass transitions 81.20P to 81.20T, and 81.60 Materials science)

- 113738 Non-crystalline semiconductors.** H.Fritzsche (Dept. of Phys., Univ. of Chicago, Chicago, IL, USA). *Acta Polytech. Scand. Electr. Eng. Ser. (Finland)*, no.EL50, p.3-46 (1983). (Proceedings of Helsinki International Summer School on Semiconductors 1982, Espoo, Finland, 14-18 June 1982). Discusses some important concepts which clarify the fundamental difference between the two main classes of noncrystalline semiconductors, the glasses and the amorphous films. A glass is considered to be a material, which can be quenched from the supercooled melt and usually exhibits a glass transition. The term amorphous is restricted to noncrystalline materials which can normally be prepared only in the form of thin films by deposition on substrates which are kept sufficiently cool to prevent crystallization. A simple band model for non-crystalline semiconductors are described. Finally, the author deals with the understanding of electronic transport, the determination of the density of electronic states, and the relation of gap states with certain bonding or structural defects in the materials. (59 refs.)
- 113739 Electron-diffraction investigation of amorphous titanium dioxide films.** S.S.Olevskii, M.S.Sergeev, A.L.Tolstikhina, A.V.Koshchenko, B.S.Khavin, I.G.Tonoyan. *Inorg. Mater. (USA)*, vol.18, no.9, p.1313-16 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1534-7 (Sept. 1982). [received: Sept. 1983] A new algorithm for the machine calculation of the short-range atomic order, which provides for complete automation of the determination of the electron-density radial distribution function, has been described. The method has been used to study the structure of amorphous TiO_2 films obtained by pyrolysis. It has been found that the short-range order characteristic of crystalline modifications of TiO_2 is maintained in these films. (8 refs.)
- 113740 Surface undulations in explosive crystallization: a thermal instability.** W.van Saarloos, J.D.Weeks (Bell Labs., Murray Hill, NJ, USA). *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1046-9 (19 Sept. 1983). It is argued that surface undulations observed after self-sustained rapid crystallization of amorphous films result from a thermal instability that induces a periodically varying crystallization rate. Its physical origin is discussed for a simple nonlinear heat-conduction model which yields good agreement with experimental observations. A numerical analysis of the nonlinear oscillations shows that these may, in turn, bifurcate via a series of period-doubling bifurcations. (17 refs.)
- 113741 Study of crystallisation on non-crystalline V_2O_5 by electrical resistivity measurements.** J.C.Rifflet, A.M.Anthony (Centre de Recherches sur la Phys. des Hautes Températures, CNRS, Orleans, France). *Rev. Int. Hautes Temp. & Refract. (France)*, vol.20, no.1, p.37-44 (1983). In French. Electrical resistivity of non-crystalline vanadium pentoxide obtained by rapid quenching has been studied. The current-voltage characteristics show that the behavior of the conductivity cell is not ohmic and that the current is limited by space charge effects. Important instabilities in measurements appear in the vicinity of 190°C while water is eliminated before crystallisation. The activation energy of the process is high and the electrical conductivity varies according to the sample. Many factors seem to contribute to the mechanism of conducting, including microstructure, water content, surface conduction, and quenching rate. (20 refs.)
- 113742 Defects in amorphous silicon.** D.K.Biegelsen (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.75-86 It is argued that amorphous silicon can be treated as a relaxed continuous random network. The optical and electronic properties are controlled by localized gap states which arise from characteristic features of a disordered tetrahedrally-bonded covalent network. Experimental results are reviewed which indicate that the dominant (perhaps only) electrically-active defect in hydrogenated amorphous silicon is the topologically distinct, silicon dangling bond. Finally, the author suggests that the same, disorder-related characteristics might also typify the electronic properties of some macroscopic crystalline silicon defects. (36 refs.)

61.40D Glasses

- 113743 On the crystallization of $\text{Fe}_{67}\text{Co}_{18}\text{Si}_{14}$ metallic glass.** F.L.Cumbrera, C.F.Conde, M.Millan, A.Conde, R.Marquez (Dept. de Optica, Facultad de Fisica, Univ. de Sevilla, Sevilla, Spain). *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.499-502 (Sept. 1983). The authors present a short report about microstructural changes during crystallization of $\text{Fe}_{67}\text{Co}_{18}\text{Si}_{14}$ alloy from transmission electron microscopy studies. (14 refs.)
- 113744 Molecular dynamics studies on the structure of binary metallic glasses based on Lennard-Jones (12-6) potentials.** I. $\text{Ni}_{81}\text{B}_{19}$ and $\text{Cu}_{57}\text{Zr}_{43}$. O.Beyer, C.Hoheisel (Lehrstuhl für Theoretische Chem., Ruhr-Univ. Bochum, Bochum, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.859-65 (Aug. 1983). For the metallic glass $\text{Ni}_{81}\text{B}_{19}$ the partial pair-distribution functions are determined up to 14 \AA by a molecular dynamics simulation using effective Lennard-Jones potentials. The obtained pair-distribution functions are in good agreement with the measured ones. As the simulation was carried out at the thermodynamic conditions for a liquid, the authors conclude that the characteristic features of the structure of the metallic glass are essentially not different from those of the fluid system $\text{Ni}_{81}\text{B}_{19}$ at high temperature and pressure. both the high reduced density of the system and the large differences in the atomic radii of the two species dominantly determine the form of the partial structure factors of the glass. These findings have been confirmed by the molecular dynamics simulation of a further metallic glass, the $\text{Cu}_{57}\text{Zr}_{43}$ system. (33 refs.)
- 113745 Interaction of transition metals with metalloids and thermodynamic stability of amorphous alloys.** A.Ya.Belen'kii (Inst. of Metall. & Phys. of Metals, Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.290-7 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* A new concept of the thermodynamic stability of amorphous alloys between transition metals and metalloids is proposed. It is based on the hypothesis that the amorphous structure minimizes the heat of solution of the metalloid impurity. The experimental data on solid solutions and interstitial phases, and also on chemisorption heats are analysed and presented in a systematic manner. The results account for the observed tendency for the formation of glasses by alloys of transition metals characterized by almost filled d bands with metalloids of sufficiently large atomic size. (22 refs.) A.T.
- 113746 Microscopic inhomogeneities in silicate glass.** N.P.Novikov, L.Ya.Denisova, N.N.Novikova (S. Ordzhonikidze Moscow Geological Prospecting Inst., Moscow, USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1368-9 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1592-4 (Sept. 1982). [received: Sept. 1983] The authors propose a new method for revealing silicon dioxide crystal inclusions. This method for observing silicon dioxide crystals is based on their local heating under the influence of high intensity monochromatic radiation. The most common crystallization form for silicon dioxide is cristobalite, therefore the work was directed at detection of cristobalite crystals in samples of K-8 glass. (5 refs.)
- 113747 Effect of CaO and MgO on crystallization in lead borosilicate glasses.** S.Sachdev, R.C.Buchanan (Dept. of Ceramic Engng., Univ. of Illinois, Urbana, IL, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.9, p.1884-8 (Sept. 1983). The effects of crystallization of CaO and MgO additions to high lead borosilicate glasses were investigated. Both oxides were found to promote crystallization when added in amounts $> 10 \text{ mol.}\%$ (m/o), with CaO being the more effective additive. Crystal phases $4\text{PbO} \cdot 3\text{CaO} \cdot \text{SiO}_2$ and $8\text{PbO} \cdot \text{MgO} \cdot 6\text{SiO}_2$ were identified in the crystallized CaO and MgO containing glasses, respectively. Morphology of the crystals was hexagonal. (11 refs.)
- 113748 Transition metal ions in glasses: network modifiers or quasi-molecular complexes?.** C.Nelson (Sandia Nat. Labs., Albuquerque, NM, USA), T.Furukawa, W.B.White. *Mater. Res. Bull. (USA)*, vol.18, no.8, p.959-66 (Aug. 1983). Transition metal ions dissolve in silicate, phosphate, and borate glasses as molecular units, quasi-molecular complexes, and occupants of large, framework structure-controlled sites depending on size and ionic charge. Raman spectra and optical absorption spectra support this hypothesis and offer a new interpretation for the assignment of certain transition metal ions to tetrahedral sites in the glass structure. (19 refs.)
- 113749 The local environment around hydrogen atoms in hydrogenated NiTi_2 alloy glass.** K.Kai (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan), S.Ikeda, T.Fukunaga, N.Watanabe, K.Suzuki. *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.342-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). The local environments around H and D atoms absorbed into NiTi_2 alloy glass have been studied by neutron inelastic and total scattering using the KENS spallation neutron source. The local hydrogen atom vibration spectrum of NiTi_2 glass shows much broader peaks, the positions of which are nearly identical with those of the corresponding crystal. Higher harmonics of the local hydrogen atom vibration are clearly observed up to the fourth order for $\text{NiTi}_2\text{H}_{1.5}$ glass. The frequency shifts relative to the harmonic value indicate an anharmonic potential of hydrogen atoms in the glass hydride. The RDFs for $\text{Ni}_{0.33}\text{Ti}_{0.67}\text{D}_x$ ($x=0, 0.08, 0.26$ and 0.60) have a negative peak at 1.95 \AA originating mostly from D-Ti pairs in the glass hydrides. The greater fraction of D atoms occupies the tetrahedral site mainly consisting of Ti atoms even in the glass hydrides. From the D-D correlations in the RDF and a low energy shoulder in the hydrogen atom vibration spectrum, a small part of the hydrogen atoms is found to be trapped in the octahedral site surrounded by six metal atoms. (11 refs.)
- 113750 On the change in coordination of Ge atoms in $\text{Na}_2\text{O-GeO}_2$ glasses.** M.Ueno, M.Misawa, K.Suzuki (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.347-51 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). High resolution observations of the short-range structure in $\text{Na}_2\text{O-GeO}_2$ glasses were carried out by TOF pulsed neutron total scattering using an

electron LINAC neutron source. With increasing Na_2O content, the average coordination number of O atoms around a Ge atom increases from 4.0 and reaches a maximum of about 4.5 at the composition of 20 mol% Na_2O , beyond which the coordination number decreases to approach 4.0 at the composition of 40 mol% Na_2O . The nearest neighbouring Ge-O correlation in a GeO_6 -octahedron structural unit is evidently separated from that in a GeO_4 -tetrahedron structural unit in the first peak profile of the radial distribution function in the cases of GeO_2 -8, 16 and 21 mol% Na_2O glasses. When one molecule of Na_2O is added to the glasses, one GeO_4 -tetrahedron structural unit is modified into one GeO_6 -octahedron structural unit without forming non-bridging O atoms up to the composition of 20 mol% Na_2O . (19 refs.)

113751 Chemical short-range structure of $\text{Ni}_x\text{Ti}_{1-x}$ ($x=0.26-0.40$) alloy glasses. T.Fukunaga, N.Hayashi, K.Kai, N.Watanabe, K.Suzuki (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.352-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

The Bhatia-Thornton (1970) neutron total structure factors of Ni-Ti alloy glasses containing 74, 67 and 60 at% Ti were measured by a pulsed neutron scattering technique using a spallation neutron source. All the Ni-Ti alloy glasses were prepared by rapid quenching from the molten state and their average coherent neutron scattering lengths were artificially adjusted to zero by ^{60}Ni -isotope substitution. Therefore, experimental Bhatia-Thornton neutron total structure factors of the alloy glasses provide exclusively the concentration-concentration structure factor $S_{CC}(Q)$. The reduced concentration correlation function $G_{CC}(r)$ obtained as the Fourier transform of $S_{CC}(Q)$ shows a sharp and negative minimum at about $r \sim 2.54$ Å. This implies that there are predominantly Ni-Ti unlike atom neighbours at the nearest distance in Ni-Ti alloy glasses. The generalised Warren chemical short-range order parameters calculated from the $G_{CC}(r)$ have negative values in all the Ni-Ti alloy glasses. Based on these experimental observations, the authors conclude that the chemical short-range structure of Ni-Ti alloy glasses over the composition range from 60 to 74 at% Ti is quite close to that found in the crystalline NiTi_2 compound. (11 refs.)

113752 The very-small angle neutron scattering from SiO_2 -PbO glasses. T.Takahashi (Faculty of Engng., Univ. of Tokyo, Tokyo, Japan), H.Tominitsu, Y.Ushigami, S.Kikuta, K.Doi, S.Hoshino. *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.362-6 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

The very-small angle scattering (VSAS) of neutrons, an angular range of a few seconds, has been measured by means of a double-crystal diffractometer of Bonse-Hart type. With a plate of silica glass, no evidence for the VSAS was observed. After it was irradiated with thermal neutrons at a fluence of $3 \times 10^{19}/\text{cm}^2$ at 48°C , a VSAS central peak with a FWHM of 2.2 s was observed. A radius of gyration of 3×10^5 Å was obtained when the effects of multiple scatterings were corrected for. The lead glass $(1-x)\text{SiO}_2 \cdot x\text{PbO}$ was examined by the neutron VSAS. For $x < 60\%$ no VSAS were observed, while at $x = 65\%$ a VSAS central peak with a FWHM of 0.24 s appeared, for which a radius of gyration of 10^5 Å was derived. An argument is advanced to verify that the observed VSASs are really produced by the scattering and not by the refraction of neutrons. (9 refs.)

113753 Polarised neutron scattering from the amorphous ferromagnet, $\text{Fe}_{83}\text{B}_{17}$. R.A.Cowley, D.McK.Paul (Dept. of Phys., Univ. of Edinburgh, Edinburgh, Scotland), W.G.Stirling, N.Cowlam. *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.373-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

A polarised neutron triple axis crystal spectrometer at the Institut Laue Langevin has been used to measure the inelastic nuclear and magnetic scattering from the amorphous ferromagnet, $\text{Fe}_{83}\text{B}_{17}$. The theory of the experiment in which a polarised beam is scattered by the sample and analysed by an unpolarised analyser is developed. The difference in the scattering when the polarisation of the incident beam is reversed is not simply related to the magnetic susceptibility. The experimental results for wavevector transfers close to the peak of the magnetic structure factor show magnetic scattering which is very similar to that which would be expected from a Heisenberg-like powdered ferromagnet, although the specimen is truly amorphous. (6 refs.)

113754 Molecular dynamics simulation of the structure of soda silica. S.K.Mitra, R.W.Hockney (Dept. of Computer Sci., Univ. of Reading, Reading, England). *Philos. Mag. B (GB)*, vol.48, no.2, p.151-67 (Aug. 1983).

In this work five soda silica glasses containing 5, 10, 15, 20 and 33 mole per cent of soda are simulated by using the molecular dynamics method. The calculated structures of these systems are compared with recent neutron diffraction and EXAFS results. As in pure silica glass, a network of silicon-oxygen tetrahedra exists in these systems. The sodium ions are connected to this network through non-bridging oxygen 'bonds'. The ratio of bridging to non-bridging oxygen ions depends on the composition of the system. In low soda containing systems, microclusters rich in soda are formed. From the hole analysis in these systems, it appears that the sodium ions tend to occupy holes in the silica network. (20 refs.)

113755 Vitrification kinetics of ternary silica-alumina-lime glass powders. A.Lerich, P.Pilate, M.R.Anseau, C.Lebud, F.Cambier (Centre de Recherches de l'Industrie Belge de la Ceramique, Mons, Belgium). *Rev. Int. Hautes Temp. & Refract. (France)*, vol.20, no.1, p.25-36 (1983). In French.

Vitrification kinetics of glass powders was first studied by Frenkel (see J. Tech. Phys., vol.9, p.385, 1945) who proposed an idealised model describing the beginning of the phenomenon. Since his work a lot of empirical or phenomenological equations or geometrical models based relations have been proposed in order to describe the vitrification kinetic. The authors have investigated the applicability of these different equations on the sintering of ternary silica-alumina-lime glass powders. (14 refs.)

113756 Influence of preparation techniques on the structure of amorphous metallic alloy $(\text{Mo}_{0.6}\text{Ru}_{0.4})_{25}\text{B}_{18}$. M.Mehra, W.L.Johnson (W.M. Keck Lab. for Engng. Materials, California Inst. of Technol., Pasadena, CA, USA), A.P.Thakoor, S.K.Khanna. *Solid State Commun. (USA)*, vol.47, no.11, p.859-62 (Sept. 1983).

The authors report X-ray diffraction studies and density measurements on liquid quenched foils and sputter deposited films of the amorphous metallic alloy $(\text{Mo}_{0.6}\text{Ru}_{0.4})_{25}\text{B}_{18}$. The crystallization temperature (T_c) for both the films and the foils is $\sim 800 \pm 10^\circ\text{C}$. The density of the as-sputtered films is $\sim 4\%$ less than that of the foils. The annealing of these films at $\sim T_c/2$ increases the density to within $\sim 1.7\%$ of the value for the foils. The X-ray diffraction patterns for both the foils and films are similar and show the amorphous nature of the samples. The reduced radial distribution functions suggest that as-sputtered films have noticeably larger second and third nearest

neighbor distances, probably due to excess residual stresses and voids in them. (11 refs.)

113757 Variation of the glass-forming regions in the B_2O_3 - Li_2O system with cooling rate. R.Ota, N.Soga (Dept. of Industrial Chem., Kyoto Univ., Kyoto, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.6, p.265-71 (1983). In Japanese. By cooling a number of B_2O_3 - Li_2O melts containing 96~20 mol% B_2O_3 from the liquidus to room temperature, glass-forming regions have been determined under various cooling rates; $Q_1 = 1.2 \times 10^{-3}$, $Q_2 = 9.1 \times 10^{-3}$, $Q_3 = 7.9 \times 10^{-2}$, $Q_4 \approx 3 \times 10^{-1}$, $Q_5 \approx 2$, $Q_6 \approx 7$, $Q_7 \approx 50$, $Q_8 \approx 2 \times 10^3$ and $Q_9 \approx 10^5$ K/s. The glass-forming region, which is restricted in a narrow range of high content of $\text{B}_2\text{O}_3 \geq 86$ mol% at Q_1 , extends continuously with increasing rate of cooling, and glass can be obtained in a range of $\text{B}_2\text{O}_3 \geq 25$ mol% at the cooling rate of Q_9 . An examination of the liquid viscosities in and out of the glass-forming regions in the system revealed that (1) increasing rate of cooling Q decreases the critical liquidus viscosity η_L^* of the melt and accordingly (2) the critical cooling rate Q^* for glass formation is dependent on the liquidus viscosity η_L of the melt. In order to understand the slope of the $\log Q^* - \log \eta_L$ or $\log Q - \log \eta_L^*$ diagram in the system, the composition dependence of the fusion entropy ΔS_f was computed from the equation proposed for glass formation. It was found that η_L and $1/Q^*$ change monotonously with composition while E_a/T_L or ΔS_f goes through a maximum or a minimum. (17 refs.)

113758 Self-diffusion of macromolecules in the crystallization of a polymer from solution. A.I.Maklakov, N.K.Dvoyashkin. *Vysokomol. Soedin. Ser. B (USSR)*, vol.25, no.6, p.397-400 (1983). In Russian.

The selfdiffusion of polyethyleneglycol molecules in crystallization from concentrated solution in deuterated benzene, acetone, and chemically pure CCl_4 is studied by a pulsed magnetic field NMR method, using a dimensionless parameter D^* for determining the degree of change in the rate of translational motion of the macromolecules, where D^* is related to the coefficients of selfdiffusion of polyethyleneglycol initially and at a time t_k of phase transformation, and on the assumption that the crystals of polyethyleneglycol formed in solution do not significantly affect the selfdiffusion process. It is noted that the process of selfdiffusion of polyethyleneglycol macromolecules in crystallization of the polymer from solution can be disturbed by the appearance of a concentration gradient close to the surfaces of the crystalline structures formed. However, because of the high viscosity of the solution, the high concentration of nuclei, and the marked localization of the gradient this disturbance is small, so that conventional selfdiffusion laws can be applied. (5 refs.) N.S.

113759 Structural changes in a cross-linked and plasticized amorphous polymer. O.V.Startsev, I.I.Perepechko, L.T.Startseva, G.P.Mashinskaya. *Vysokomol. Soedin. Ser. B (USSR)*, vol.25, no.6, p.457-61 (1983). In Russian.

Previous work on epoxide polymers is discussed in detail and curves are reproduced showing $\log T_c$ is versus plasticizer concentration w , the density of the epoxide polymer as a function of plasticizer concentration, and $\tan \delta$ for the epoxide polymer as a function of temperature, where T_c is the glass transition temperature and δ is the mechanical loss angle. On graphical resolution of the whole of the wide unsymmetrical peak for the mechanical losses into three Gaussian curves it is found that each of these peaks can be assigned to a corresponding level of supermolecular organization of the plasticized polymer. (3 refs.) N.S.

113760 X-ray diffraction study of the drawn poly(aryletherketone) (PEEK). D.R.Rueda, F.Ania, A.Richardson, I.M.Ward (Dept. of Phys., Univ. of Leeds, Leeds, England), F.J.Balta Calleja. *Polym. Commun. (GB)*, vol.24, no.9, p.258-60 (Sept. 1983).

Oriented PEEK rods obtained by die drawing have been analysed by wide-angle X-ray diffraction. Fibre patterns reveal that orientation mainly improves with draw ratio. An orthorhombic unit cell with $a = 7.75 \pm 0.01$, $b = 5.89 \pm 0.01$ and c (fibre axis) $= 9.883 \pm 0.005$ Å has been found. The unit cell parameters for isotropic and oriented PEEK are similar, remaining constant through the investigated die drawing conditions. The fibre periodicity differs from that reported previously for PEEK. The similarity between the structure of PEEK and that reported for poly(p -phenylene oxide) is confirmed. (9 refs.)

113761 Supermolecular structure of liquid crystalline polymer with mesogenic side groups and brominated main chain. V.V.Tsukruk, V.V.Shilov, Yu.S.Lipatov (Inst. of Macromolecular Chem., Acad. of Sci., Kiev, Ukrainian SSR).

Polym. Commun. (GB), vol.24, no.9, p.260-2 (Sept. 1983). Structural studies on the supermolecular organization in a polymer with mesogenic side groups and a brominated main chain have been conducted. A smectic structure is shown to be realized in this polymer. Planar smectic

layers are aggregated into layered packs 20 to 25 nm in size. The number of closely packed layers in such a pack is 4 or 6. (10 refs.)

113762 Effect of moisture on physical properties of nylon. B.L.Deopura, A.K.Sengupta, A.Verma (Fibre Sci. Lab., Indian Inst. of Technol., New Delhi, India).

Polym. Commun. (GB), vol.24, no.9, p.287-8 (Sept. 1983).

The physical properties (glass transition temperature and mechanical behaviour) of nylon are highly sensitive to moisture content in the polymer. Several independent studies by a number of authors have shown that variation in properties with increasing moisture regain is non-linear. Most of the observations can be explained on the basis of the differences in mobility and free volume of the nylon structure due to the different methods of bonding of water molecules within the polyamide chains, at different regains. (12 refs.)

113763 Small-angle X-ray scattering studies of microdomain structure in segmented polyurethane elastomers. J.T.Koberstein (Polymer Materials Program, Dept. of Chem. Engng., Princeton Univ., Princeton, NJ, USA), R.S.Stein.

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1439-72 (Aug. 1983).

The small-angle X-ray scattering (SAXS) technique has been used to characterize the detailed microphase structure of two crosslinked segmented polyurethane elastomers. Both copolymers contain trifunctional polypropylene ether triols in the rubbery elastomeric block, but are synthesized with different hard segments: a symmetric 4,4'-diphenylmethane diisocyanate (MDI) chain extended with butanediol (BD); and an 80/20 mixture of asymmetric 2,4-toluene diisocyanate (TDI) and symmetric 2,6-toluene diisocyanate (TDI) chain extended with ethylene glycol (EG). Calculations of SAXS invariants and determinations of deviations from Porod's law are used to examine the degree of phase segregation of the hard- and soft-segment domains. Results show that the overall degree of phase separation is poorer in the asymmetric TDI/EG-based copolymer than in the symmetric MDI/BD-based copolymer. Determination of diffuse phase boundary thicknesses, however, reveals that the domain boundaries are sharper in the asymmetric TDI/EG system. The contrasting morphologies found in the two systems are interpreted in terms of differences in hard-soft segment compatibility, diisocyanate symmetry, and diisocyanate length. Coupled with conformational considerations, this information is used to construct a new model for polyurethane hard-segment microdomain structure. (47 refs.)

113764 Spectroscopic characterization of solvent-induced crystallization of PET. S.-B.Lin, J.L.Koenig (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1539-58 (Aug. 1983).

Using recently developed quantitative FTIR methods, the gauche and trans conformer compositions have been measured for polyethylene terephthalate (PET) samples exposed to benzene and acetone. The kinetics of the primary and secondary isomerization stages of the solvent-induced crystallization process have been studied and compared with the thermally crystallized system. The Arrhenius activation energies of isomerization in the primary stage in which Fickian diffusion behavior is followed for the benzene- and acetone-induced PET systems are 8.2 ± 0.4 and 7.7 ± 0.4 kcal/mol., respectively. (31 refs.)

113765 Polymer single crystals of poly(4-hydroxybenzoate). I. Morphology. G.Leiser, G.Schwarz, H.R.Kricheldorf (Inst. für Makromolekulare Chem. der Univ., Freiburg, Freiburg, Germany).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1599-609 (Sept. 1983).

Poly(4-hydroxybenzoate) was prepared from 4-acetoxybenzoic acid, 4-pivaloxybenzoic acid, and 4-trimethylsiloxy benzoyl chloride by condensation without the addition of a catalyst. Although various reaction conditions were used the products were always crystalline. The morphology of the as-polymerized crystals has been studied by transmission electron microscopy as a function of molecular weight and end-group type. It was possible to detect morphological features during the course of reaction from oligomers to polymer which enable us to determine the mechanisms that are likely to control chain growth for different regimes of polymerization kinetics. (11 refs.)

113766 Polymer single crystals of poly(4-hydroxybenzoate). II. A contribution to crystal structure and polymorphism. G.Lieser (Inst. für Makromolekulare Chem., Univ. Freiburg, Freiburg, Germany).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1611-33 (Sept. 1983).

For pt.I see *ibid.*, vol.21, no.9, p.1599-609 (1983). Electron diffraction has been used to investigate the structure of a wide range of as-polymerized crystals of poly(4-hydroxybenzoate) [systematic name: poly(1,4-oxycarbonyl)]. The chemical composition and the degree of polymerization (DP) have been varied and some samples have been thermally treated. At room temperature two crystalline modifications with orthorhombic unit cells coexist. The chains adopt a 2_1 helical conformation in both forms, but there are differences for oligomer and polymer crystals. Oligomers of low DP have an extended chain-conformation, whereas in polymers a shortening of the repeat distance along the chain is observed as a function of both the DP and the crystallization conditions. From the most extensive data sets the lattice parameters $a=7.52$, $b=5.70$, and $c=12.49$ Å were derived for polymer crystals of phase I, and the subcell parameters for oligomer crystals of phase II $a=3.77$, $b=11.06$, and $c=12.89$ Å. Both phases contain two chains per unit cell. In addition to modifications I and II several defect structures exist the unit cells of which contain more than two chains. At temperatures which depend on the degree of polymerization, a phase transition to a third modification takes place. (12 refs.)

113767 Small-angle X-ray scattering study of density fluctuation in pressure-densified polystyrene glasses. J.J.Curro, R.J.Roe (Dept. of Materials Sci. & Metallurgical Engng., Univ. of Cincinnati, Cincinnati, OH, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1785-96 (Sept. 1983).

Densified polystyrene glasses, prepared by cooling from the liquid state under elevated pressure, were studied by small-angle X-ray scattering at ambient pressure. The density fluctuation, determined from the X-ray data, showed a decrease with increasing pressure up to about 1.5 kbar, and then leveled off to a fairly constant value. The reduction in the density fluctuation produced by the pressure is much greater than the associated decrease in the specific volume. The observed change in density fluctuation is consistent with the view that the density fluctuation in glassy polymers consists of dynamic and quasistatic components and that the first of these can be correlated with the compressibility of the glass. The present data on the density fluctuation, in conjunction with the available data on volume and enthalpy, can be interpreted to mean that in pressure-densified glasses unfavorable chain configurations are trapped in local energy minima, and the strain energy thus stored can promote segmental motion leading to volume expansion at temperatures far below T_g . (25 refs.)

113768 Characterization of lattice disorder in the low-temperature phase of irradiated PTFE by vibrational spectroscopy. J.F.Rabolt (IBM Res. Lab., San Jose, CA, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1797-805 (Sept. 1983).

In an effort to elucidate the structure of the low-temperature phase of PTFE, a spectroscopic study of the effect of progressive irradiation on the low-frequency infrared spectrum was undertaken. Previous infrared and Raman measurements indicated that irradiation of PTFE decreases its crystalline content, resulting in a lowering of the 19°C phase transition temperature due to the introduction of disorder and defect structures into the lattice by chain scission. Far-infrared studies of virgin and irradiated PTFE at liquid nitrogen temperatures show that the medium to strong bands at 45, 54, 58 and 71 cm^{-1} , attributed to lattice vibrations, decrease in intensity as the crystalline content decreases. These findings support the assignment of these bands to intermolecular vibrations of the crystalline lattice and are an indication of the presence of more than one molecule in the crystallographic unit cell. (24 refs.)

113769 Chain orientation in polystyrene/poly(2,6-dimethyl-1,4-phenylene oxide) blends. L.H.Wang, R.S.Porter (Polymer Sci. & Engng. Dept., Univ. of Massachusetts, Amherst, MA, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1815-23 (Sept. 1983).

The differential orientation of polymer chains has been measured in polystyrene (PS)/poly(2,6-dimethyl-1,4-phenylene oxide) (PPO) compatible blends. Density measurements are reported as a function of primary blend compositions at 23°C. Drawing was performed by solid-state coextrusion. PS/PPO blend compositions of 90/10 and 75/25 were drawn within sandwiches of polyethylene at 145°C and isotactic polypropylene at 155°C, i.e. at ca. 25°C above the glass transition temperatures of the two blends. The change in Fourier-transform infrared dichroisms on drawing these blends was measured at 906 and 1190 cm^{-1} , corresponding to predominantly PS and PPO, respectively. The orientation of PS and PPO was observed as a function of draw ratio λ in the range 1-5; orientations increased with λ for both PS and PPO in both blends but to different degrees. Both polymers decreased in orientation with increasing PPO content. Annealing with fixed ends showed that the PPO chains disorient more slowly than those of PS. All binary systems were found to be amorphous and compatible. (22 refs.)

113770 Polyvinylidene fluoride (PVDF). K.-I.Nakamura, Y.Teramoto, N.Murayama.

Solid State Phys. (Japan), vol.18, no.6, p.344-51 (June 1983). In Japanese.

PVDF is a semicrystalline polymer which may exist in four crystalline forms α , β , γ and polar α -form. Polarized films of PVDF exhibit large piezo and pyro-electricity. (27 refs.)

113771 A critical assessment of the application of FT-IR spectroscopy to the study of crystalline/compatible polymer blends. M.M.Coleman, D.F.Varnell, J.P.Runt (Dept. of Materials Sci. & Engng., Pennsylvania State Univ., Univ. Park, PA, USA).

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.59-70.

The application of Fourier transform infrared spectroscopy to the study of polymer blends is discussed. Its use in determining compatibility of blends and their degree of crystallinity is critically examined. The technique is used to determine the state of order of both components in a crystalline/compatible polymer blend. (15 refs.)

113772 Phase domain size and continuity in sequential IPNs: a review. L.H.Sperling, J.M.Widmaier, J.K.Yeo, J.Michel (Materials Res. Center, Lehigh Univ., Bethlehem, PA, USA).

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.191-218.

Two theories of phase domain size in sequential interpenetrating polymer networks were developed and compared, using results based on poly(n-butylacrylate)/polystyrene. While the earlier theory of Donatelli (1967) yielded good results as far as it went, the newer theory of Yeo is much more comprehensive. Both theories assume the existence of isolated spheres, a major drawback. Scanning electron microscopy and density measurements on decrosslinked and extracted materials indicate that midrange compositions have dual phase continuity. However, assuming equivalent spheres for the domains, both transmission and scanning electron microscopy yield good comparisons with theory. (25 refs.)

(inc. molecular motions in solids; for magnetic structure and spin systems, see 75.25)

113773 A new method of site occupancy analysis in substitutional mixed crystals by means of X-ray crystal structure analysis. I. Pseudo lattice and superposition structure of a substitutional mixed crystal. A.Zedler (Zentralinst. fur Phys. Chem., Akad. der Wissenschaften, Berlin, Germany). *Cryst. Res. & Technol. (Germany)*, vol.18, no.8, p.985-95 (1983).

In pt.I the nature of disorder in mixed crystal structures will be discussed on the basis of a pseudo lattice concept. A mixed crystal pseudo lattice applicable to all atomic positions of these mixed crystal structures will be defined, and the concept of a statistically global-disordered ideal structure will be introduced. The structure factor for mixed crystal structures will be derived in consideration of the statistic disorder of position and sort of the atoms. The interpretation of the mixed crystal structure as a superposition structure requires the replacement of Vegard's rule by a new one having a wider range of validity. (14 refs.)

113774 Hindered rotational energy levels of a tetrahedron in a tetragonal crystalline field. D.Smith (Dept. of Chem., Pennsylvania State Univ., Hazleton, PA, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2989-94 (15 Sept. 1983).

The hindered rotational energy levels of a tetrahedron in a tetragonal crystalline field have been computed. The symmetry group of the Hamiltonian is $T \times D_2$, where T is the tetrahedral group of rotations about body-fixed axes and D_2 represents the tetragonal group of rotations about space-fixed axes. The parameters in the potential function are determined for the tetragonal phases of NH_4Br and NH_4I assuming an electrostatic model. (13 refs.)

113775 Crystallization of quartz from fluoride solutions. G.M.Safronov, V.V.Popov, A.F.Kuznetsov, A.A.Lepkov (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1310-12 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1531-3 (Sept. 1982). [received: Sept. 1983]

The possibility of growing quartz crystals from aqueous solutions of ammonium fluoride has been demonstrated. It has been found that the dependence of the rate of growth of the crystals on the crystallographic orientation of the seed during the growth of quartz from fluoride solutions is the same as in the case of alkaline solutions. The use of fluoride solutions makes it possible to grow quartz crystals at rates more than twice as great as those for crystals grown from alkaline solutions without worsening of their quality. In the quartz crystals grown from fluoride solutions there is practically no sodium impurity, and the content of aluminum and several other impurities is reduced considerably. (6 refs.)

113776 Production and properties of crystals of complex refractory oxides with perovskite structure. B.T.Melek, A.A.Andreev, N.F.Kartenko, A.B.Pevtsov, V.A.Trepakov, Yu.N.Filin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR). *Inorg. Mater. (USA)*, vol.18, no.10, p.1388-92 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1620-4 (Oct. 1982). [received: Sept. 1983]

The authors have studied the characteristic features of direct high-frequency melting and growth of crystals of a number of complex refractory oxides with perovskite structure, and carried out X-ray diffraction studies of the materials obtained. They have studied the spectroscopic properties of crystals of BaZrO_3 , BaHfO_3 , $\text{Pr}_2\text{Ti}_2\text{O}_7$. (17 refs.)

113777 Correlation between growth hillocks and dislocations on the {110} faces of flux grown yttrium aluminium garnet. K.J.Roberts (Inst. fur Kristallographie, RWTH, Aachen, Aachen, Germany), D.Elwell. *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.449-57 (Aug. 1983).

A direct correlation between the growth hillocks observed on the {110} habit faces of flux grown yttrium aluminium garnet and dislocations in the crystal bulk is demonstrated. The dislocations were analyzed by X-ray topography using diffraction contrast experiments and by utilizing theoretical deductions of the preferred dislocation line directions. The dislocations were found to be of mixed character with a substantial screw component along the growth normal. Possible crystal growth mechanisms are discussed. (30 refs.)

113778 Growth of $\text{Cd}_2\text{Hg}_{1-x}\text{Te}$: comparison of some properties with the predictions of two melt growth models. P.Capper, C.L.Jones, E.J.Pearce, M.J.T.Quelch (Mullard Ltd., Millbrook Industrial Estate, Southampton, England). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.487-97 (Aug. 1983).

The theoretical predictions of the two normal freeze growth models involving no convective mixing and complete mixing are described. Crystals have been grown using a range of growth speeds and initial compositions in two temperature profiles designed to affect these conditions in the $\text{Cd}_2\text{Hg}_{1-x}\text{Te}$ (CMT) system. The axial and radial compositional uniformity found in these crystals is compared with the predictions of the two models. The relative effects on radial compositional uniformity of isotherm shape, radial segregation, density-driven convective flow and convection imposed by the temperature profiles are also discussed. It is found that radial variations in composition decrease as the growth rate decreases and that these variations must be taken into account when interpreting axial composition profiles. It is considered that density-driven convective flow is the most significant force in determining radial variations in composition. Convective flow induced by the temperature profile is also seen to influence these variations while isotherm effects and radial segregation are thought to be much less significant. (13 refs.)

113779 Some formulae describing spherical and hemispherical diffusion to small crystals in unstirred solutions. S.Fletcher (CSIRO Inst. of Energy & Earth Resources, Div. of Mineral Chem., Port Melbourne, Victoria, Australia). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.505-12 (Aug. 1983).

Formulae for the growth rates of spherical and hemispherical crystals are derived taking into account interfacial kinetics and bulk diffusion. Also included are the effects of preceding chemical reactions, time-varying nucleation rates, and reactant depletion. The results are written in two ways depending on whether the driving force for crystallization is an overpotential (electrochemical kinetics) or a supersaturation (solution kinetics). (15 refs.)

113780 Finite analysis of the control of interface shape in Bridgman crystal growth. L.-Y.Chin (Phillips Petroleum Co., Bartlesville, OK, USA), F.M.Carson. *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.561-7 (Aug. 1983).

Numerical experiments were performed on a vertical Bridgman crystal growth system. The thermal field was studied in the absence of fluid motion by solving the steady state energy equation using a finite element method. Key parameters were isolated and their influence on the interface curvature was assessed. These included insulation zone thickness, system temperatures, Biot numbers, solid-liquid thermal conductivity ratio, and ampoule location in the furnace. It was concluded that interface curvature could be controlled by the crystal grower to achieve any desired shape. (3 refs.)

113781 The influence of glycine, according to pH, upon the growth habit of NaCl and KI, in aqueous solution. A.Julg, B.Deprick (Lab. de Chimie Théorique, Univ. de Provence, Marseille, France). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.587-94 (Aug. 1983).

The authors have studied the effect of glycine molecules upon the growth habit of NaCl and KI structures, in aqueous solution. The electronic adsorption energy is evaluated by means of an 'ab-initio' SCF method and the dispersion energy, arising from the fact that the structure ions are not point charges, by means of a semiempirical Lennard-Jones pair potential. Solvation of the substrate and of the glycine molecules, as well as the association between glycine molecules are taken into account. The total energy balance is positive (8.9 kcal/mole) only for the adsorption of zwitterion chains close to a {110}₂ double step of NaCl. This result allows one to explain the modifications of the growth habit of NaCl $\{100\} \rightarrow \{110\}$. (21 refs.)

113782 In situ observations of the growth behaviour of the {010} face of potassium hydrogen phthalate. L.A.M.J.Jetten, B.Van Der Hoek, W.J.P.Van Enckevort (RIM Lab. of Solid State Chem., Univ. of Nijmegen, Nijmegen, Netherlands). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.603-11 (Aug. 1983).

The surface morphologies of the {010} face of potassium hydrogen phthalate crystals, growing in an aqueous solution, have been studied in situ by means of optical reflection microscopy. The observations have been recorded by means of a video system. Several phenomena have been investigated by this method, namely: spiral growth via high (10-250 nm) and low steps (2.8-10 nm), step acceleration near reentrant corners in step patterns, inclusion formation via step overhangs, the formation of etch pits and the reactivation of the centre of a blocked spiral. (6 refs.)

113783 Comments on the role of the cubic structure in ice nucleation. C.A.Knight (Nat. Center for Atmospheric Res., Boulder, CO, USA). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.633-4 (Aug. 1983).

Takahashi's calculation (ibid., vol.59, p.441, 1982) that hexagonal ice may nucleate as cubic ice applies for homogeneous nucleation. The special bicrystal orientations that he discusses have only been observed from heterogeneous nucleation, and may be explainable in another way. (7 refs.)

113784 An effect of roughened layer clustering on crystal growth rates. D.Nason (Capricornia Inst., Rockhampton, Australia). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.645-7 (Aug. 1983).

The growth rates of solid/liquid interfaces as predicted by Monte Carlo and by analytical methods are modified to account for co-operative effects in the roughened layers by the requirement of a minimum cluster size. The results predict a decrease in growth rate in all cases, but the reduction is only significant for higher melting entropy materials. (10 refs.)

113785 Simulation studies of the hydrodynamics in high-temperature solutions for crystal growth. V. Shape of the crystal/liquid interface in the presence of simultaneous free and forced convections. V.Nikolov, K.Iliev, P.Peshev (Inst. of General & Inorganic Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria). *Mater. Res. Bull. (USA)*, vol.18, no.8, p.1037-44 (Aug. 1983).

The formation conditions of a concave, convex or flat crystal/liquid interface in the presence of simultaneous free forced convections have been investigated using model liquids. Simultaneous free and forced convections with both the same and opposite flow directions have been considered. The interface shape was found to depend on the direction and rate of the resultant convection flow under the crystal. The formation conditions of a flat interface for liquids

having kinematic viscosities of 0.001×10^{-3} – 0.5×10^{-3} m²/s and for crystal diameters of 10, 15 and 20 mm, respectively, have been established. These conditions have been compared with the optimum conditions found experimentally by other authors for the growth of several kinds of crystals from high-temperature solutions by the TSSG method and from melts by the Czochralski method. The comparison has shown that the model proposed describes well the real processes. (12 refs.)

113786 Formation of crystal structures in microgravitational conditions. N.B.Brandt, A.G.Belov, L.I.Devyatkov, G.S.Zhdanov, V.V.Zubenko, V.G.Karavaev, V.V.Moshchalkov, N.R.Nurtdinov, G.N.Ronami, I.V.Telegina, M.V.Chukichev, T.D.Sherbatova, A.B.Yunovich (Dept. of Solid State Phys., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.1-6 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.3-8 (1983).

The structure and some physical properties of a series of solid structures, eutectic compositions, and epitaxial layers are investigated. The study is performed on samples grown under conditions of microgravitation, in comparison with samples obtained under terrestrial conditions. Methods of optical and electron-raster spectroscopy, X-ray structural, and X-ray spectral analysis, photoluminescence, and cathode luminescence are used; quantum oscillational and optical effects are investigated. Certain peculiarities in the formation of the crystal and electronic structure of the material are observed. (5 refs.)

113787 Kinetics of normal growth of an ordering crystal. E.A.Brener, D.E.Temkin (Inst. of Solid State Phys., Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.7-11 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.18-26 (Jan.-Feb. 1983). [received: Sept. 1983]

In the framework of the phenomenological theory equations are derived for the growth kinetics of an ordering crystal. The authors investigate the case in which crystallization occurs without change of composition and ordering is a second-order transition. By solving the resulting equations they are able to determine how the growth rate depends on the temperature at the crystallization front and to find the distribution of the long-range order parameter relative to the moving interface. In all the cases the theory predicts the existence of a critical transition point from growth of an ordered crystal to growth of a disordered one. The authors investigate the behavior of the growth rate as a function of temperature in the neighborhood of the transition point. For various cases they give an estimate of the critical rate corresponding to the transition point. (9 refs.)

113788 Kinetic transition during growth of a crystal undergoing ordering. E.A.Brener, D.E.Temkin (Inst. of Solid State Phys., Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.142-6 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.244-51 (March-April 1983). [received: Sept. 1983]

The authors consider normal growth of a crystal undergoing ordering, and take account of relaxation of the order parameter in the crystal. A previously formulated phenomenological equation is qualitatively investigated for the case in which ordering is a first-order phase transition. If, during fall of temperature, the velocity of the ordering front v_f becomes less than the rate of growth of the disordered crystal v_0 , then as the supercooling increases, at the crystallization front there may be a kinetic phase transition from growth of an ordered crystal to growth of a disordered one. This transition can be continuous or discontinuous. In the former case, the graphs of the order parameter and growth rate vs. the supercooling have breaks at the transition point, and the transition point is determined by the equation $v_f = v_0$. In the second case, which is analogous to a thermodynamic first-order transition, the order parameter and the growth rate have discontinuities at the transition point. During growth in nonisothermal conditions, a situation can arise in which the ordering front, located at a certain distance from the crystallization front, moves at the same rate as the latter. The fronts interact via the thermal field. The authors investigate the stability of stationary solutions and formulate a general criterion determining the limit of stability for growth in either isothermal or nonisothermal conditions. (8 refs.)

113789 Experiments on crystallization of semiconductors aboard Salyut 6-Soyuz orbital complex. V.S.Zemskov, M.R.Raukhan, I.N.Belokurova (Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR). Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.325-9

Experimental data on space crystallization of Ge-Si solid solution from the gaseous phase by chemical transport reaction method have shown the pure diffusive mechanism of mass transport in microgravity environment. It has been found that on-seed growth of Te doped InSb single crystals in space could occur without contact between the melt and the ampoule walls, which provided high structural perfection of the neck region. The dominating mechanism of mass transfer in the melt was diffusion, with Marangoni convection induced in the neck region. The crystallization features of InSb-InBi alloys are indicative of a specific segregation behavior of the alloy constituents depending on microacceleration. (12 refs.)

113790 In situ observations of crystal growth processes. L.A.M.J.Jetten, W.J.P.van Enckevort (RIM Lab. of Solid State Chem., Faculty of Sci., Univ. of Nijmegen, Nijmegen, Netherlands). Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.97-102

The authors present a study of fundamental crystal growth processes for crystallization from solution and from the vapour phase. Generally in such studies the crystal growth process has been investigated by measuring growth kinetics or by a posteriori characterization of the crystal surface or the internal defect structure. Interpretation however is often hindered, because of limitations of these experimental methods. By in situ observation both growth kinetics and surface morphology can be studied simultaneously. Video recording permits high resolution and analog contrast amplification. With a diode array camera the image can be digitized and by subtracting two subsequent pictures even more information can be derived for a dynamic process. (4 refs.)

113791 Determinantal representations for the crystallographic point groups. K.J.Duff, E.H.Salib (Dept. of Phys., Univ. of Wollongong, Wollongong, New South Wales, Australia).

Aust. J. Phys. (Australia), vol.36, no.4, p.485-9 (1983).

A table of the values of the determinants of the representation matrices for the crystallographic point groups is given to facilitate the application of some recent theorems concerning determinantal wavefunctions. (3 refs.)

113792 Determination of phases from linear relations between structure amplitudes. E.A.Soldatov, E.A.Kuz'min, V.V.Ilyukhin, N.V.Belov (Physicochem. Inst. & N.I. Lobachevski State Univ., Gorki, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.993-4 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.853-5 (Dec. 1982). [received: Sept. 1983]

In an earlier paper (see *ibid.*, vol.27, p.908, 1982) the authors presented a method of determining the phases of structure amplitudes on the basis of the linear relation between structure amplitudes. The system of linear equations for the phase parts of the structure amplitudes (exp *iφ*) corresponds to the case when one of the atoms of the structure is at the origin (image of the structure at an atom). It must be assumed that it would be advantageous to have the coordinates of the heavy atom. With the standard crystallographical method of choosing the origin (on the basis of the symmetry group of the crystal) this condition cannot always be satisfied (except in the case of the symmetry group P1). In the general case, this makes it difficult to take the symmetry into account. It is thus worth endeavoring to find relations of the above type such that their phase part would be invariant with respect to the choice of origin. (5 refs.)

113793 A theorem on rotations in the space of quaternions. V.I.Burdina (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.994-6 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1122-4 (Dec. 1982). [received: Sept. 1983]

In the study of the proper subdivisions of a three-dimensional sphere of rotations in the process of reducing the individual subunits—rotation stereohedra—to a central gnomonic projection use is made of the smallest-angle rotation in four-dimensional Euclidean space R⁴ that takes the center of the stereohedron (generally speaking, any point of the sphere S³) into a pole P. In computer calculations these rotations may be required in order to effect the rotation of a polyhedron located in the three-dimensional tangential subspace so as to obtain the most appropriate image on the plotting board of a graph plotter connected to the computer. 113794 Phase transitions in Na₃Sc₂(PO₄)₃ and in related compounds with [M₂(EO₄)₃]³⁻ frameworks. V.B.Kalinin, B.I.Lazoryak, S.Yu.Stefanovich (L.Ya. Karpov Sci.-Res. Physicochem. Inst., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.154-8 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.264-70 (March-April 1983). [received: Sept. 1983]

The authors discuss the mechanism of the phase transitions in the ferroelectric ionic conductor Na₃Sc₂(PO₄)₃. They elucidate the crystal-chemical causes of the polymorphism of this compound and of Na₃M₂(PO₄)₃ (M=Cr,Fe) and Na₃Zr₂Si₂PO₁₂. They analyze the composition-structure-property relationships for Me_nM₂(EO₄)₃, where E is a Group IV, V, or VI element, M is a divalent, trivalent, or quadrivalent cation, Me is a small cation compensator and n=0-4. 113795 X-ray spectroscopic investigation of the nature of chemical binding in metal-like titanium carboaluminides of variable composition. I.A.Brytov, V.S.Neshpor, Yu.N.Romashchenko, E.A.Obolenskii, V.I.Ivchenko (Sci.-Production Combine "Burevestnik", Leningrad, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.253-60 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

The X-ray spectroscopy method was used to study the nature of chemical binding in metal-like carboaluminides Ti_2AlC_x and Ti_3AlC_x ($0.2 \leq x \leq 1.2$). Information was obtained on the relative contribution of the valence electrons of the atoms of the components to the valence bands of these carboaluminides. The special features of the electron structure of these compounds compared with the binary carbides $TiC_{0.96}$ and Al_4C_3 were identified and the nature of the interaction of the atoms of the components with one another was determined. (23 refs.) *A.T.*

113796 Calculation of the unit-cell parameter for solid solutions with the spinel structure. V.M.Talanov (Novocherkassk Polytech. Inst., USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1316-21 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1538-43 (Sept. 1982). [received: Sept. 1983]

A new method is proposed for calculating the unit-cell parameter of solid solutions with the spinel structure; results of the method agree well with available experimental data. (12 refs.)

113797 Rare earth atom-to-solid core level shifts: sensitivity to valence changes. J.F.Herbst (Phys. Dept., General Motors Res. Labs., Warren, MI, USA).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.227-34 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Free-atom-to-metal shifts of several lanthanide core electron binding energies were calculated. The shifts were obtained directly from relativistic Hartree-Fock calculations of the individual atomic and solid state binding energies. Results for the 2p, 3d, 4f, 5s and 5p levels are reported. A marked dependence on the core state quantum numbers is apparent in the shifts derived for the elements praseodymium to samarium and terbium to thulium which undergo a valence change on formation of the metal. A single shift characterizing all core levels of a given element cannot be assumed therefore when a configuration change involving the 4f states occurs on solid formation. (8 refs.)

113798 Photoabsorption study of bonding in some 3d-4f intermetallics and other compounds. K.B.Garg, H.S.Chauhan, S.G.Saxena, S.Chandra (Dept. of Phys., Univ. of Rajasthan, Jaipur, India).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.242 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given. 3d-4f intermetallics of the type R_2T_3 (where R is a 4f metal and T is a 3d metal) are industrially important magnetic materials. The bonding in these compounds is expected to involve a decrease in the size of the R atoms and an increase in the size of the T atoms. The authors studied this question by making measurements on the X-ray absorption near the edge structure, particularly on the energy position of the edge and the so-called white lines, for both types of constituent atoms in these compounds. The energy shifts observed for the L_{III} edges of the R constituent and for the K edge of the T constituent appear to lend support to the idea of change in the relative sizes of the two types of atoms. No changes have been observed in the intensities of the white lines at the L_{II} and the L_{III} edges and in the areas under them. These are interpreted in terms of non-participation of d states in bonding. Similar photoabsorption measurements were carried out on a number of organic complexes of some rare earth metals. The measurements were made using a 400 mm bent crystal spectrograph. The intermetallic compounds were prepared by arc melting the constituents in an argon atmosphere followed by annealing and characterization using X-ray diffraction. (no refs.)

113799 Calculation of lattice sums for polarization energy of an NaCl-type crystal. B.M.Bulakh (Inst. of Semiconductors, Acad. of Sci., Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.1-5 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.5-13 (Jan.-Feb. 1983). [received: Sept. 1983]

Representation of lattice sums by finite algebraic functions permits their direct summation over an infinite lattice. This method is used to calculate the lattice sums of the component of the band energy due to polarization of crystal by a charged particle at any lattice point in the crystal or above its surface. 113800 Structure of N_2 at 2.94 GPa and 300K. D.Schiferl, D.T.Cromer, R.R.Ryan, A.C.Larson, R.LeSar, R.L.Mills (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1151-3 (15 Sept. 1983). A single crystal of β - N_2 was grown in a Merrill-Bassett diamond-anvil cell and examined by X-ray diffraction at 2.94 (6) GPa and 300 (2) K. As observed in an earlier high-pressure study, the structure is hexagonal, space group $P6_3/mmc$, with two molecules per unit cell. The lattice constants are $a=3.595$ (1) and $c=5.845$ (1) Å, giving a molar volume of 19.71 (1) cm^3 . The value of R_w , refined from 9 observed reflections, is 0.041, for a model with statistically disordered molecules tilted 54° from the c axis, and 0.040 for a spherically disordered model. Calculations using a Gordon-Kim electron-gas model show that the $P6_3/mmc$ structure has a minimum energy when the N_2 molecules are tilted at an angle of 51° . (20 refs.)

Indian J. Phys. Part A, vol.57A, no.3, p.196-9 (May 1983). High temperature X-ray diffraction studies were carried out on Fe-Ni samples at a temperature from 400 to 700°C to know more about the nature of lattice parameter changes. (10 refs.)

113802 Structure formation in lightly-doped chromium alloys during plastic deformation in the 1400-1450K region. V.I.Trefilov, N.A.Storchak, V.N.Minakov, V.A.Manilov, L.S.Igolkina, Yu.E.Zubets (Inst. of Problems in Materials Sci., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1060-2 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1117-21 (Dec. 1982). [received: Sept. 1983]

Despite the large number of studies that have been done on the structure of deformed single-crystal and polycrystalline materials with the BCC lattice, there is still no agreement on the features of the structure formation at high degrees of deformation in polycrystalline alloys, and no universally acknowledged model for a highly deformed polycrystalline material has yet been proposed. The goal of the present study was to investigate the structural changes in lightly doped polycrystalline alloys of chromium ($\text{Cr}+0.5\text{La}+0.5\text{V}+0.5\text{Ta}$) following plastic deformation produced by rolling at temperatures of 1400-1450K with various degrees of plastic deformation (reductions) per pass. The total quantity of introduced impurities ($\text{C}+\text{N}+\text{O}$) was not more than 0.015% by mass. (7 refs.)

113803 Structure refinements of some thermally disordered dolomites. R.J.Reeder (Dept. of Earth & Space Sci., State Univ. of New York, Stony Brook, NY, USA), H.R.Wenk.

Am. Mineral. (USA), vol.68, no.7-8, p.769-76 (July-Aug. 1983). Single crystal X-ray structure refinements of one ideally ordered and two partially disordered dolomites provide structural data about the thermally induced, cation disordering process. Most refined parameters show progressive and gradual changes as disorder increases. It was found that completely disordered crystals could not be recovered using piston-cylinder methods owing to reordering during the quench. This factor limited the range over which disorder in quenched specimens could be studied, although some parameters are extrapolated to complete disorder. New experiments confirm that disorder is complete by 1150°C. Electron density maps based on intensity data from specimens which exceeded the critical disordering temperature suggest CO_3 group disorder of a rotational kind. (23 refs.)

113804 Surinamite, $\text{Ca}_2\text{Mg}_2\text{Al}_2\text{Si}_2\text{BeO}_{16}$; its crystal structure and relation to sapphirine, $\text{Ca}_2\text{Mg}_2\text{Al}_2\text{Si}_2\text{O}_{16}$. P.B.Moore, T.Araki (Dept. of the Geophys. Sci., Univ. of Chicago, Chicago, IL, USA).

Am. Mineral. (USA), vol.68, no.7-8, p.804-10 (July-Aug. 1983). Surinamite is monoclinic, space group $P2_1/n$, with $a=9.916$ (1), $b=11.384$ (1), $c=9.631$ (1) Å, $\beta=109.30$ (1)°. The asymmetric unit contains $\text{Ca}_2\text{Mg}_2\text{Al}_2\text{Si}_2\text{BeO}_{16}$ comprised of nine octahedral cations and five tetrahedral cations incorporated in a cubic close-packed array of sixteen independent oxygen atoms. $R=0.047$ for 2998 independent reflections. The structure consists of octahedral walls running parallel to x which are connected along y by an open branched chain $[\text{TeO}_5]$ where one of the tetrahedra, $\text{T}(1)$, is principally occupied by Be^{2+} . This tetrahedron is unique in the asymmetric unit in that three of its vertices are shared by other tetrahedra. (12 refs.)

113805 A refinement of the crystal structure of ohmilitite, $\text{Sr}_3(\text{Ti,Fe}^{3+})(\text{O,OH})(\text{Si}_2\text{O}_6)_2 \cdot 2\text{-}3\text{H}_2\text{O}$. T.Mizota (Dept. of Mining & Mineral Engng., Yamaguchi Univ., Ube, Yamaguchi, Japan), M.Komatsu, K.Chihara. *Am. Mineral.* (USA), vol.68, no.7-8, p.811-17 (July-Aug. 1983).

The monoclinic unit cell of ohmilitite, $\text{Sr}_3(\text{Ti,Fe}^{3+})(\text{O,OH})(\text{Si}_2\text{O}_6)_2 \cdot 2\text{-}3\text{H}_2\text{O}$, has dimensions $a=10.979(6)$, $b=7.799(5)$, $c=7.818(4)$ Å, $\beta=100.90(3)^\circ$, and space group $P2_1/m$; $Z=2$, $V=657.4(6)$ Å³. The crystal structure has been refined to an R-value of 5.9% for 2121 independent reflections. Vertex-sharing Ti-O octahedra form chains parallel to b . Each of the octahedral chains is flanked by a pair of $[\text{Si}_2\text{O}_6]^{2-}$ chains, which are similar to those found in batistite and haradaite, thus forming a composite chain of composition $[\text{Si}_4\text{O}_{12}(\text{Ti}_2\text{O}_7)\text{Si}_4\text{O}_{12}]^{12-}$. These composite chains are joined together by Sr atoms and water molecules to form the structure. Of the three independent Sr atoms, $\text{Sr}(1)$ and $\text{Sr}(3)$ are 9-coordinated, with average Sr-O distances of 2.675 Å. $\text{Sr}(2)$ is 8-coordinated, with average bond length of 2.586 Å. The average Ti(Fe)-O bond length is 1.992 Å. Average Si-O distances are 1.643 and 1.606 Å for bridging and nonbridging bonds, respectively. As consistent with the IR data, hydrogen is present as both H_2O and OH. The former forms hydrogen bonds with the oxygen atoms of the composite chains, with O-O distances from 2.69 to 2.83 Å. The latter is associated with the octahedral cations in accordance with the substitution scheme, $\text{Ti}^{4+}\text{O}^{2-} \rightarrow \text{Fe}^{3+}\text{OH}^-$. (13 refs.)

113806 Crystal structure and Mossbauer spectrum of vonsenite, $2\text{FeO} \cdot \text{FeBO}_3$. J.S.Winnear, H.Steinink (Dept. of Chem. Engng., Univ. of Texas, Austin, TX, USA). *Am. Mineral.* (USA), vol.68, no.7-8, p.827-32 (July-Aug. 1983).

The crystal structure of the mineral vonsenite has been redetermined from a synthesized specimen of composition $2\text{FeO} \cdot \text{FeBO}_3$. The unit cell dimensions are $a=9.463(1)$ Å, $b=12.305(1)$ Å, $c=3.0727(6)$ Å, $Z=4$, space group $Pbam$. The final coordinates gave $R=0.054$ and $\omega R=0.029$ for 614 structure amplitudes and $R=0.030$, $\omega R=0.027$ for 461 amplitudes greater than $2\sigma(F)$. The crystal structure is essentially unchanged from the structure reported in 1950 but the precision of the parameters is at least an order of magnitude better. Values of valence sums, Mossbauer spectra, and the distortions present in the four crystallographically independent octahedra containing Fe1, Fe2, Fe3 and Fe4 are consistent with the presence of two pairs of physically distinct iron ions. Fe1 and Fe3 are divalent; the bond distance between Fe2 and Fe4 is 2.787 Å and direct exchange occurs so that an intermediate oxidation state of +2.5 is observed. The Mossbauer spectra are complex and indicate the presence in the structure of Fe^{2+} , Fe^{3+} and $\text{Fe}^{2.5+}$. As the temperature is lowered from room temperature the Mossbauer spectra show the migration of a low velocity peak due to Fe^{3+} towards the high velocity peak due to the dinuclear complex Fe2-Fe4 in which Fe has an intermediate valence state. (21 refs.)

113807 X-ray and electron diffraction analysis of GaSe crystals. M.K.Anis, F.M.Nazar (Thin Films Res. Lab., Punjab Univ., Lahore, Pakistan).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.471-4 (Sept. 1983).

Both X-ray and electron diffraction techniques have been used to study single crystals grown by the Bridgman-Stockbarger method. It has been found that these crystals are hexagonal ζ -GaSe. (14 refs.)

113808 New structure determination of murchichtite, Cu_2PbO_8 . E.Dubler, A.Vedani, H.R.Oswald (Inst. of Inorganic Chem., Univ. of Zurich, Zurich, Switzerland).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1143-6 (15 Sept. 1983). $M_r=716.4$, cubic, space group $Fm\bar{3}m$, $a=9.224(2)$ Å, $V=784.8(3)$ Å³, $Z=4$, $D_x=6.06$ Mg m⁻³, $5.9 \leq D_m \leq 6.7$ Mg m⁻³, $\lambda(\text{Mo K}\alpha)=0.71069$ Å, $\mu=37.55$ mm⁻¹, $T=295$ K. Final $R=0.027$ for 255 unique observed reflections. The structure consists of $[\text{PbO}_8]$ cubes with Cu^{2+} ions spanning the 12 edges of the O_8 cubes building up a three-dimensional network to give a square-planar $[\text{CuO}_4]$ coordination. Halogen ions which occupy the interstices complete a (4+2) elongated $[\text{CuO}_4\text{X}_2]$ octahedron. The four Cu-O separations are 1.921 (1) Å and the Cu-X separations 3.261 (2) Å. Therefore, murchichtite is not a representative of a compound with an undistorted octahedral copper coordination (dynamic Jahn-Teller effect) as proposed by Christ & Clark (1955). This fact is consistent with thermoanalytical measurements. In view of the varying content of chloride and bromide in natural samples of murchichtite its general formula may best be described as $\text{Cu}_2\text{PbO}_{8-x}(\text{Cl,Br})_{2x}$, with $x \leq 0.5$. (11 refs.)

113809 Room-temperature structure of carbon monoxide at 2.7 and 3.6 GPa. D.T.Cromer, D.Schiffel, R.LeSar, R.L.Mills (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1146-50 (15 Sept. 1983).

A single crystal of CO was grown at room temperature in a high-pressure Merrill-Bassett diamond cell and examined by X-ray diffraction at 2.7 and 3.6 GPa. At 4.2 GPa the sample appeared to undergo a photochemical change induced by the weak laser light used to make ruby fluorescence pressure measurements. The unit cell is hexagonal, space group $P6_3/mmc$, with two molecules per unit cell, which is the same as that of β -CO near the triple point. At $P=2.7$ GPa the lattice constants are $a=3.615(1)$ and $c=5.880(1)$ Å, and at 3.6 GPa they are $a=3.532(1)$ and $c=5.744(2)$ Å, giving molar volumes very near to those for β -N₂ under similar conditions. The final R_w refined from ten observations, is 0.103 for a model with molecules tilted 40° from the c axis, statistically disordered, and randomly polarized. Calculations using a Gordon-Kim electron-gas model show that the $P6_3/mmc$ structure with randomly polarized CO molecules should have a minimum energy at a tilt angle of 50°, while polarized molecules give 48°. The melting pressure of CO at room temperature is about 2.6 GPa and is considerably lower than published measurements would indicate. (54 refs.)

113810 Synthesis and structure of a nonstoichiometric caesium niobate, $\text{Cs}_3\text{Nb}_{5.9}\text{O}_{16.4}$. M.-C.Saine, M.Gasperin (Lab. de Mineralogie-Cristallographie, Univ. Pierre et Marie Curie, Paris, France).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1153-6 (15 Sept. 1983). In French.

$M_r=1214.86$, orthorhombic, *Amam*, $a=18.315(3)$, $b=24.506(4)$, $c=7.296(2)$ Å, $V=3274.6$ Å³, $Z=8$, $D_x=4.93$ Mg m⁻³, $\lambda=0.7107$ Å, $\mu(\text{Mo K}\alpha)=10.9$ mm⁻¹, $F(000)=4324.48$, room temperature, $R=0.040$ for 3034 reflections. The crystal composition is very close to $\text{Cs}_2\text{O} \cdot 2\text{Nb}_2\text{O}_5$ but the deficiency of Nb_2O_5 results in a new structural type derived from $\text{Cs}_3\text{Nb}_6\text{O}_{11}$ and pyrochlore by the breaking of octahedral chains. Moreover, the structure contains $(\text{NbO}_4)^{3-}$ tetrahedra linked by one corner to form $(\text{Nb}_2\text{O}_7)^{4-}$ groups. The Nb-O distances range from 1.71 (1) to 2.3 (1) Å in the octahedra and from 1.55 (1) to 2.76 (1) Å in the tetrahedra. Cs-O ranges from 2.78 (1) to 3.52 (1) Å. (3 refs.)

113811 Tricobalt hexasodium hexakis(hexahydroxohexaborate) hexacosahydrate, $\text{Na}_6\text{Co}_3[\text{B}_6\text{O}_7(\text{OH})_6]_6 \cdot 26\text{H}_2\text{O}$. H.Behm (Inst. fur Kristallographie, Univ. Karlsruhe, Karlsruhe, Germany).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1156-9 (15 Sept. 1983). $M_r=2456.5$, triclinic, *P1*, $a=9.572(4)$, $b=13.560(6)$, $c=18.034(6)$ Å, $\alpha=109.04(3)^\circ$, $\beta=96.46(3)^\circ$, $\gamma=102.37(3)^\circ$, $Z=1$, $V=2119(1)$ Å³, $D_x=1.92$, $D_m(\text{floatation})=1.88$ Mg m⁻³, $\lambda(\text{Mo K}\alpha)=0.71069$ Å, $\mu(\text{Mo K}\alpha)=7.63$ cm⁻¹, $F(000)=1246.8$, room temperature, $R=0.042$ for 6670 reflections. The structure belongs to the class of soroborates and consists of hexaborate groups between which the Co atoms are octahedrally coordinated. These Co hexaborate units are surrounded by hydrated Na atoms and water molecules. (12 refs.)

113812 Structures of 20 new polytypes of cadmium iodide. B.Palosz (Inst. of Phys., Warsaw Tech. Univ., Warszawa, Poland).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1160-3 (15 Sept. 1983). The structures of 20 new polytypes of CdI₂ obtained from solution are presented: $18H_2$: $(1/5)f(1/2)(o)3f1$; $20H_{13}$: $(1/3)f(1/2)f(1/2)f1$; $28H_6$: $(1/3)f(1/2)(1/2)f1$; $28H_7$: $(1/3)f(1/2)(1/2)f(1/2)(1/2)f1$; $30H_6$: $(1/5)f(1/2)(1/2)f(1/2)f1$; $34H_4$: $(1/5)f(1/2)f1$; $34H_5$: $(1/3)f(1/2)f(1/2)f(1/2)f(1/2)f1$; $(1/3)f(1/2)(1/2)f(1/2)f1$; $(1/3)f(1/2)(1/2)f(1/2)f1$; $60R_3$: $(1/3)f(1/2)(1/2)f(1/2)f1$; $66R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$; $72R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$; $78R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$; $84R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$; $90R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$; $96R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$; $102R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$; $108R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$; $120R_3$: $(1/4)f(1/2)(1/2)f(1/2)f1$. Similarities and differences between hexagonal and rhombohedral polytypes are discussed. (18 refs.)

113813 Orthorhombic uranium(IV) molybdenum(VI) oxide, UMo_2O_8 . T.L.Cremers, P.G.Eller, R.A.Penneman, C.C.Herrick (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1163-5 (15 Sept. 1983). $M_r=557.8$, orthorhombic, *Pbam*, $a=20.076(4)$, $b=7.323(1)$, $c=4.1164(6)$ Å, $V=605.2$ Å³, $Z=4$, $D_m=6.08(6)$, $D_x=6.12$ Mg m⁻³, $\text{Mo K}\alpha$, $\lambda=0.70930$ Å, $\mu=367$ cm⁻¹, $F(000)=960$, $T=298$ K, $R=0.049$ for 1347 reflections. The structure consists of layers of oxide-bridged uranium and molybdenum atoms connected by infinite interlayer U-O-U and Mo-O-Mo chains. The uranium atoms have pentagonal bipyramidal coordination [U-O equatorial=2.202 (6)=2.394 (8) Å, U-O axial=2.0584 (3) Å]; the molybdenum atoms are in a highly distorted octahedral [Mo-O=1.684 (7)-2.432 (7) Å] arrangement. The presence of oxide ions not connected to molybdenum suggests that this structure is better formulated as a double oxide-molybdate than as a true molybdate. (20 refs.)

113814 Orthorhombic thorium(IV) molybdate, $\text{Th}(\text{MoO}_4)_2$. T.L.Cremers, P.G.Eller, R.A.Penneman (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1165-7 (15 Sept. 1983). $M_r=551.9$, orthorhombic, *Pbca*, $a=10.318(5)$, $b=9.737(4)$, $c=14.475(6)$ Å, $V=1454$ Å³, $Z=8$, $D_x=5.04$ Mg m⁻³, $\text{Mo K}\alpha$, $\lambda=0.70930$ Å, $\mu=244$ cm⁻¹, $F(000)=1904$, $T=298$ K, $R=0.038$ for 3167 unique reflections. The structure is that of a true molybdate, with nearly regular molybdate tetrahedra bridging to thorium coordinated in a nearly regular square antiprismatic environment. (9 refs.)

113815 Ammonium trifluoroberyllate(II), $(\text{NH}_4)_3[\text{BeF}_6]$, at room temperature. A.Waskowska (Inst. for Low Temperature & Structure Res., Polish Acad. of Sci., Wrocław, Poland).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1167-9 (15 Sept. 1983). $M_r=84$, monoclinic, *Pn*, $a=5.770(2)$, $b=4.619(3)$, $c=12.819(1)$ Å, $\beta=90.12(2)^\circ$, $V=341.6(4)$ Å³, $Z=4$, $D_m=1.63(2)$, $D_x=1.632(3)$ Mg m⁻³, $\lambda(\text{Cu K}\alpha)=1.54051$ Å, $\mu=2.04$ mm⁻¹, $F(000)=168$. Final $R=0.049$ for 536 observed reflections. At room temperature the crystal is ferroelastic. Hydrogen-bonded chains of BeF_4 tetrahedra run along the b axis and undergo a pronounced thermal motion around this axis. Diffuse streaks observed at room temperature on Weissenberg photographs are probably connected with the phase transition to the orthorhombic phase at 334.3K. (11 refs.)

113816 Structure of orthopyroxene-type and clinopyroxene-type magnesium germanium oxide MgGeO_3 . M.Ozima (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1169-72 (15 Sept. 1983).

Orthopyroxene-type: $M_r=144.92$, orthorhombic, *Pbca*, $a=18.809(12)$, $b=8.9484(8)$, $c=5.3451(4)$ Å, $V=899.69(12)$ Å³, $Z=16$, $D_x=4.28$ gcm⁻³, $\lambda(\text{Ag K}\alpha)=0.56087$ Å, $\mu(\text{Ag K}\alpha)=75.64$ cm⁻¹, $T=300$ K, $F(000)=1088$, $R=0.025$ for 975 independent reflections. Clinopyroxene-type: $M_r=144.92$, monoclinic, *C2/c*, $a=9.6010(8)$, $b=8.9323(6)$, $c=5.1592(5)$ Å, $\beta=101.034(9)^\circ$, $V=434.27(6)$ Å³, $Z=8$, $D_x=4.43$ gcm⁻³, $\lambda(\text{Ag K}\alpha)=0.56087$ Å, $\mu(\text{Ag K}\alpha)=78.35$ cm⁻¹, $T=300$ K, $F(000)=544$, $R=0.021$ for 1025 independent reflections. Orthorhombic MgGeO_3 (the high-temperature and low-pressure phase) is isostructural with orthoenstatite, MgSiO_3 . The structure of monoclinic MgGeO_3 (the low-temperature and high-pressure phase) is different from that of clinoenstatite which crystallizes in $P2_1/c$. The orthorhombic (*Pbca*) to monoclinic (*C2/c*) transformation in MgGeO_3 is accompanied by a fairly large volume decrease (3.5%). A smaller distortion of the $\text{Mg}(2)$ octahedron in the structure of monoclinic MgGeO_3 causes the higher density. (11 refs.)

113817 Disilver(I) decachlorodioxotetraaluminate(III), $\text{Ag}_2[\text{Al}_4\text{Cl}_{10}\text{O}_2]$. D.Jentsch, P.G.Jones, E.Schwarzmann, G.M.Sheldrick (Inst. fur Anorganische Chem., Univ. Göttingen, Göttingen, Germany).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1173-4 (15 Sept. 1983). $M_r=710.20$, orthorhombic, *Pbca*, $a=11.240(2)$, $b=12.278(4)$, $c=12.955(3)$ Å, $V=1788$ Å³, $Z=4$, $D_x=2.64$ g cm⁻³, $\text{Mo K}\alpha$ radiation ($\lambda=0.71069$ Å, $\mu=39$ cm⁻¹), $F(000)=1328$, $R=0.045$ for 1802 unique observed reflections. The compound is formed in the system $\text{AgCl}/\text{AlCl}_3$ when traces of water are present; the deliberate use of the theoretical amount of $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$ gives a quantitative yield of polycrystalline material. The structure contains $[\text{Al}_4\text{Cl}_{10}\text{O}_2]^{2-}$ ions with crystallographic 1 symmetry. The Ag^+ ions are coordinated by five chlorines in a distorted trigonal-bipyramidal arrangement (the first observation of such coordination of Ag⁺). The extended structure is a three-dimensional polymer. (5 refs.)

113818 Single-crystal refinement of the structure of LaOCl . L.H.Brixner, E.P.Moore (Central Res. & Dev. Dept., E.I. du Pont de Nemours & Co., Wilmington, DE, USA).

Acta Crystallogr. Sect. C (Denmark), vol.C39, pt.9, p.1316 (15 Sept. 1983). LaOCl crystallizes in the tetragonal $P4/nmm$ structure of PbFCl with $a=4.1209(2)$ and $c=6.8840(7)$ Å; $Z=2$. Single crystals of LaOCl were grown from a BaCl_2 flux. Least-squares single-crystal refinement based on 81 independent reflections led to an R value of 0.011. Powder data based on Guinier refinements are also reported. No significant differences over the previous powder work [Sillen & Nylander (1941)] are found. (4 refs.)

113819 Crystal structure and vibrational spectra of $\text{Pb}_2\text{P}_2\text{S}_6$. R.Becker, W.Brockner (Inst. für Anorganische Chem., Tech. Univ. Clausthal, Clausthal, Germany), H.Schafer. *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.874-9 (Aug. 1983). In German.

$\text{Pb}_2\text{P}_2\text{S}_6$ crystallizes in the monoclinic systems, space group Pn with the lattice constants $a=940.2(4)$ pm, $b=746.6(3)$ pm, $c=661.2(3)$ pm, $\beta=91.53(5)^\circ$. The compound is isotypic to the monoclinic dimorphous II of $\text{Sn}_2\text{P}_2\text{S}_6$. In the structure there are discrete $\text{P}_2\text{S}_6^{4-}$ anions. Far infrared, infrared and Raman spectra of this compound have been recorded. The observed frequencies are assigned on the basis of $\text{P}_2\text{S}_6^{4-}$ units with C_{2h} symmetry in the crystal. DTA-data have been determined and interpreted. (20 refs.)

113820 Crystal-chemical principles of prediction of ferroelectrics and related materials in the case of compounds with $\{[\text{M}_2(\text{EO}_4)_3]^\text{P}\}_{3\infty}$ frameworks. V.B.Kalinin, S.Yu.Stefanovich (L.Ya. Karpov Sci.-Res. Physicochem. Inst., USSR).

Inorg. Mater. (USA), vol.18, no.9, p.1342-6 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1567-71 (Sept. 1982). [received: Sept. 1983]

A genetic scheme has been presented for the coordination of structures of compounds with frameworks of the composition $\{[\text{M}_2(\text{EO}_4)_3]^\text{P}\}_{3\infty}$. The structures and properties of compounds of the rhombohedral type $[\text{Fe}_2(\text{SO}_4)_3]$ type and langbeinite have been established. With the example of some double phosphates the authors have found an interrelationship between ferroelectricity and ionic conduction, arising because of the existence of large cavities of two types which link up into channels in their structures. (26 refs.)

113821 Crystal chemistry of piezoelectric with a sillenite structure. Yu.F.Kargin, A.A.Mar'in, V.M.Skorikov (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.10, p.1375-84 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1605-14 (Oct. 1982). [received: Sept. 1983]

The authors have synthesized 23 sillenite-structure compounds and carried out physicochemical investigations on them. It was found that Bi^{3+} and Bi^{5+} occupy the tetrahedral sites of the sillenite lattice formed by elements of groups II, III, V, and VI. With the aid of the IR spectra of the respective crystals they showed that ions of different charge are randomly distributed over the tetrahedral sites of the sillenite lattice. These investigations of sillenites allow them to be classified as follows: (a) constant composition compounds in which the tetrahedral positions of the BCC structure are occupied only by tetravalent ions of group-IV elements—Si, Ge, Ti; (b) variable-composition compounds in which the tetrahedral sites are occupied by randomly distributed ions of two or more elements, on the basis of phases in which the average charge of the tetrahedral cations is four. Sillenite-structure compounds in many cases do not form continuous solid solutions with each other. (51 refs.)

113822 Crystal chemistry, phase transitions, and physical properties of halide crystals with perovskite-like structure. B.V.Beznosikov, A.T.Anistratov, K.S.Aleksandrov (A.V. Kirenskiy Inst. of Phys., Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.10, p.1406-11 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1640-4 (Oct. 1982). [received: Sept. 1983]

Complex investigations of perovskite-like crystals show that, with the aid of structure prognosis and clarification of the structural elements determining the specified properties, one may synthesize new materials on the basis of halide compounds in a directed manner. (13 refs.)

113823 Crystal data for $\text{C}_{24}\text{N}_6\text{CuClO}_4\text{H}_{18}$, $\text{C}_6\text{N}_6\text{PdS}_2\text{Cl}_2\text{O}_7\text{H}_{16}$. K.Chakrabarty, S.P.Sen Gupta (Dept. of General Phys. & X-rays, Indian Assoc. for the Cultivation of Sci., Calcutta, India).

Indian J. Phys. Part A, vol.57A, no.3, p.205-7 (May 1983). Reports preliminary information on the crystallographic data of the two compounds $\text{C}_{24}\text{N}_6\text{CuClO}_4\text{H}_{18}$ (I) and $\text{C}_6\text{N}_6\text{PdS}_2\text{Cl}_2\text{O}_7\text{H}_{16}$ (II) of considerable chemical and structural interest. The first compound, bis[2-(phenylazo)pyridine] copper (I) perchlorate gives dark purple crystals. The second one, palladium bis-1-amidino-2-thiourea, is light yellow in colour and quite hard. The unit cell dimensions and space groups were determined from standard oscillation, rotation and Weissenberg (zero- and upper-layer) photographs taken along two crystallographic axes with copper-radiation. (no refs.)

113824 Electron diffraction studies of supersonic jets. V. Low temperature crystalline forms of SF_6 , SeF_6 , and TeF_6 . E.J.Valente, L.S.Bartell (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA).

J. Chem. Phys. (USA), vol.79, no.6, p.2683-6 (15 Sept. 1983).

Condensation of SF_6 , SeF_6 , and TeF_6 in nozzle flows with inert carrier gases produces microcrystals of these materials. All form the higher temperature body-centered cubic structure at higher partial pressures of hexafluoride. At lower partial pressures and colder nucleation conditions a lower symmetry form of each has been produced. Electron diffraction powder patterns are consistent with the space group Pnma to which metal hexafluorides of UF_6 type belong. Low temperature phases of the present materials differ from those of the metal compounds, however, in being less dense than the cubic forms. Aspects of the gas dynamics affording a control over nucleated species are briefly discussed. (14 refs.)

113825 Site symmetry of the metal ion in rare earth oxynitrates doped with europium(III). J.-C.G.Bunzli, B.Klein, V.Kasperek (Inst. de Chimie Minérale et Analytique, Univ. de Lausanne, Lausanne, Switzerland).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.157-8 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The high resolution laser-excited emission spectra at 273 and 77K of europium-doped lanthanum and gadolinium oxynitrates ($\text{LnONO}_3\text{:Eu}$) are analysed in terms of the site symmetry of the metal ion. To be consistent with X-ray diffraction powder diagrams the data have to be interpreted as reflecting the presence of at least two metal ion sites, one with T symmetry and the other with S_4 symmetry. (4 refs.)

113826 Structural modifications of silicon nitride as a function of temperature. M.Billy, J.C.Labbe, A.Selvaraj (Centre de Recherches et d'Etudes Ceramiques, Univ. de Limoges, Limoges, France), G.Roult.

Mater. Res. Bull. (USA), vol.18, no.8, p.921-34 (Aug. 1983). In French.

The structural evolution of α and β - Si_3N_4 has been studied up to 900°C by means of the time of flight neutron diffraction method. It has been shown that the relative evolution of lattice parameters is the same for both phases; the modifications versus temperature are isotropic along the crystallographic axes a and c. However, the atomic positions, bond angles and bond lengths at different temperatures, as well as the volume evolution of SiN_4 tetrahedra compared to that of the unit cell volume, suggest a lower stability of α - Si_3N_4 with regard to the β phase which explains the α - β transformation at higher temperatures. (23 refs.)

113827 Properties of Cu^{2+} ion in the γ - AgCuPO_4 structure. M.Quarton, M.T.Oumba (Lab. de Chimie Minérale, Univ. Pierre et Marie Curie, Paris, France).

Mater. Res. Bull. (USA), vol.18, no.8, p.967-74 (Aug. 1983). In French. AgCuPO_4 - β (high temp.) crystallizes with orthorhombic symmetry, space group: Pbc₂, Z=8 and unit-cell parameters: $a=7.500$ (1), $b=15.751$ (2), $c=5.702$ (1) Å. Its structure has been solved and refined to $R=0.046$ for 664 independent reflexions. The framework is built up with PO_4 tetrahedra, AgO_4 pyramids and CuO_5 bipyramids. The Jahn-Teller effect of Cu^{2+} and magnetic properties are discussed. (21 refs.)

113828 Crystal structure of GaSc_2O_4 ; its relation with perovskite. V.Agafonov, A.Khan, D.Michael (Lab. de Chimie Appliquée de l'Etat Solide, Urbain, Vitry, France), M.Guymont.

Mater. Res. Bull. (USA), vol.18, no.8, p.975-81 (Aug. 1983). The crystal structure of BaSc_2O_4 has been determined on single crystals. The crystal symmetry is monoclinic (C_2/c , Z=12) with a pseudorhombic unit cell. The relationship with parent perovskite structure is discussed in terms of coordination polyhedra and bond lengths. (16 refs.)

113829 New island tetrahedral $[\text{Ge}_2\text{O}_5]^\text{P}$ radical in the structure of $\text{Na}_2\text{Sn}_2[\text{Ge}_2\text{O}_5]_4\text{H}_2\text{O}$. A.N.Safronov, N.N.Nevskii, V.V.Ilyukhin, N.V.Belov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.991-3 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.850-3 (Dec. 1982). [received: Sept. 1983]

Colorless transparent single crystals of unknown composition were found during the study of hydrothermal reactions in the system SnO_2 - GeO_2 - Na_2O - H_2O (450°C, 1000 atm). The initial X-ray analysis revealed a monoclinic P unit cell $a=6.951$ (1), $b=20.062$ (2), $c=5.370$ (1) Å; $\gamma=93.25^\circ$ (1); $V=748$ Å³. The three-dimensional set of intensities, consisting of 1780 independent reflections with $I(\text{hkl}) \geq 3\sigma(I)$, was obtained from an isometric specimen on an Enraf-Nonius automatic diffractometer (MoK α radiation, $\sin\theta/\lambda \leq 0.7$ Å⁻¹, graphite monochromator). Analysis of the location of the maxima of the Patterson function in the absence of systematic extinctions pointed to P2 as the most probable space group. (5 refs.)

113830 Crystal structure of barium chlorosilicate. A.M.Ilinets, V.V.Ilyukhin, N.V.Belov, N.N.Nevskii (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.996-7 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1125-7 (Dec. 1982). [received: Sept. 1983]

Colorless transparent single crystals of unknown composition in the form of flat hexagonal plates have been isolated from products of hydrothermal crystallization during the study of the system BaO - SiO_2 - LiCl - H_2O ($T=450^\circ\text{C}$, $P=1000$ atm). The ratio of the components in the initial mixture was $\text{BaO}:\text{SiO}_2=4:1$ with a 40% concentration of the solvent LiCl. It was not possible to make a chemical analysis of the compound because the quantity of the given crystallization product was too small and the crystal structure was interpreted without knowledge of the chemical formula of the compound. (2 refs.)

113831 The crystal structure of the A phase of KLiSO_4 . P.A.Sandomirskii, S.S.Meshalkin, I.V.Rozhdestvenskaya (Inst. of Geochem. & Analytical Chem., Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.33-5 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.67-71 (Jan.-Feb. 1983). [received: Sept. 1983]

The authors have refined the crystal structure of the A phase of KLiSO_4 , which is stable at room temperature. They discuss the nature of the strong anisotropy of the thermal vibrations of the oxygen atoms. (9 refs.)

113832 The crystal structure of Na-X zeolite in hydrated and dehydrated forms. Yu.I.Smolín, Yu.F.Shepelev, I.K.Butikova, V.P.Petranskii (Inst. of Chem. of Silicates, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.1, p.36-9 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.72-8 (Jan.-Feb. 1983). [received: Sept. 1983]

The crystal structure of Na₉₂-X zeolite ($a=25.01$ Å, $Fd\bar{3}$) is refined by the method of least squares in the hydrated, dehydrated, and rehydrated forms. It is shown that when water is evaporated some of the sodium atoms in the large cavities occupy crystallographic positions. It is demonstrated that some of the S1 positions at the centers of hexagonal prisms are occupied by water molecules. It is also demonstrated that when the crystal is rehydrated there is an increase in the number of water molecules occupying crystallographic positions. (9 refs.)

113833 The crystal structure of Y_3Ge_5 ($\text{YGe}_{1.7}$). V.A.Bruskov, O.I.Bodak, V.K.Pecharskii, E.I.Gladyshevskii, L.A.Muratova (State Univ., L'vov, Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.151-3 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.260-3 (March-April 1983). [received: Sept. 1983]

The authors determine the crystal structure of the compound Y_3Ge_5 , which belongs to a new type: space group Fdd_2 , $a=5.746$ (2), $b=17.284$ (5), $c=13.696$ (3) Å, $V=1360.1$ (6) Å³. In the calculations use is made of the intensities of 318 independent observed reflections ($I > 2\sigma(I)$) measured on a Syntex P2₁ automatic diffractometer in Mo K α radiation (parallel graphite monochromator); $R=0.068$ in the isotropic approximation and $R=0.061$ in the anisotropic approximation. The structure of Y_3Ge_5 is a deformed derivative of the α - ThSi_2 type and is related to the Eu_3As_4 type. The coordination numbers of the atoms are: Y, 18; Ge, 9 and 8. (5 refs.)

113834 Observed atomic charges in β - NaN_3 crystals. A.N.Chekhlov, S.P.Ionov (Inst. of Physiologically Active Substances, Acad. of Sci., Moscow, USSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.626-31 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.682-8 (Nov.-Dec. 1982). [received: Sept. 1983] (14 refs.)

61.65 SPECIFIC STRUCTURE OF ORGANIC COMPOUNDS

- 113835** The crystal and molecular structure of $\text{N,N}'\text{-bis}[(\text{S})\text{-1-phenylethyl}]benzamide$. J.D.Korp, I.Bernal (Dept. of Chem., Univ. of Houston, Houston, TX, USA). *Chem. Scr. (Sweden)*, vol.22, no.2, p.60-3 (1983).
The structure of $\text{N,N}'\text{-bis}[(\text{S})\text{-1-phenylethyl}]benzamide$ has been determined by single crystal X-ray diffraction. Crystals are orthorhombic, space group $P2_12_12_1$, with four molecules in a unit cell of dimensions $a=8.273(4)$, $b=12.433(3)$, and $c=19.042(5)$ Å. The structure was solved by direct methods and refined to a final R value of 6.4%. The bond distances and angles are similar to those found in metal complexes with the deprotonated molecule. There is conjugation of the double bond with the adjacent C-N bond, as evidenced by the bond lengths and the tendency towards planarity of the amine nitrogen. There is no hydrogen bonding, due to the bulk of the phenyl substituents. (17 refs.)
- 113836** Crystal and molecular structure of betulin diacetate, $\text{C}_{44}\text{H}_{54}\text{O}_4$. P.K.Das (Dept. of Phys., Surendranath Coll., Calcutta, India), M.Mukherjee, S.Ray. *Indian J. Phys. Part A*, vol.57A, no.3, p.182-9 (May 1983).
The crystal structure of betulin diacetate, $\text{C}_{44}\text{H}_{54}\text{O}_4$, has been determined using 1314 data observed by diffractometry. The space group is $P2_12_12_1$ with $a=15.788(1)$, $b=12.566(2)$, $c=15.673(1)$ Å; $Z=4$. The structure was solved by direct methods and was refined to $R=0.055$. (3 refs.)
- 113837** Crystal and molecular structure and IR spectra of 1-hydroxy-4-dibromomethyl-2,2,5,5-tetramethyl- and 4-dibromomethyl-1,2,2,5,5-pentamethyl-3-imidazoline-3-oxide. Yu.V.Gatilov, M.M.Mitasov, I.A.Grigor'ev, L.B.Volodarskii (Novosibirsk Inst. of Organic Chem., Acad. of Sci., Novosibirsk, USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.899-904 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.91-7 (Nov.-Dec. 1982). [received: Sept. 1983]
The crystal and molecular structures of 1-hydroxy-4-dibromomethyl-2,2,5,5-tetramethyl- (I) and 4-dibromomethyl-1,2,2,5,5-pentamethyl-3-imidazoline-3-oxide (II) were established. In crystal (I), the α -dibromomethylnitron group is found in conformation A, where the dibromomethyl group is turned in such a way that the torsion angle between its C-H bond and the plane of the double bond is 29.5° . In molecule (II), the α -dibromomethylnitron group is characterized by a restrained conformation B, in which the H atom of the dibromomethyl group is found in an antiposition relative to the double bond. The IR spectra of (I) and (II) were investigated, and a correlation between the conformation of the α -dibromomethylnitron group and its characteristic frequencies was established. (13 refs.)
- 113838** Crystal structure of the semihydrate of the sodium salt of 5-sulfo-8-methylthioquinoline. A.D.Ozola, Ya.K.Ozols, A.A.Kemme, Ya.Ya.Bleidelis, Ya.V.Ashaks (Inst. of Inorganic Chem., Acad. of Sci., Latvian SSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.905-8 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.98-102 (Nov.-Dec. 1982). [received: Sept. 1983]
X-ray analysis was used to investigate the semihydrate of the sodium salt of 5-sulfo-8-methylthioquinoline $\text{C}_{10}\text{H}_8\text{O}_3\text{NS}_2\text{Na} \cdot 0.5\text{H}_2\text{O}$ ($a=10.889(1)$, $b=5.510(1)$, $c=39.752(4)$ Å, $\beta=105.10(3)^\circ$, space group Aa, $Z=8$, diffractometer, $\lambda\text{CuK}\alpha$, 1815 reflections, direct method, $R=0.046$). The structure consists of alternating Na^+ cations, anions of 8-S-methylquinoline-5-sulfoacid, and H_2O molecules. (11 refs.)
- 113839** Structure of macrocyclic diamides of phthalic acid. Yu.G.Ganin, E.V.Ganin, Yu.A.Simonov, V.F.Anikin, G.L.Kamalov (Inst. of Appl. Phys., Acad. of Sci., Moldavian SSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.909-13 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.103-7 (Nov.-Dec. 1982). [received: Sept. 1983]
The effect of ring size on the conformation of individual fragments and of the macrocycle as a whole was considered on the basis of an X-ray diffraction structural study of macrocyclic diamides of phthalic acid. 9,10-benz-1,7-diaza-4-oxacycloundecane-8,11-dione (I) and 12,13-benz-1,10-diaza-4,7-dioxacyclotetra-decane-11,14-dione (II). The phthalic acid fragments in the 11-membered ring in I and in the 14-membered ring in II have different structures. Features of the non-bonded 1,4-interactions involving the carbonyl groups were noted. (5 refs.)
- 113840** An X-ray diffraction structural study of nonbonded interactions in heteroorganic compounds. XXII. Crystal structure of triphenyltin 2dimethylamino-thiophenolate. L.G.Kuz'mina, Yu.T.Struchkov, E.M.Rokhlina, A.S.Peregudov, D.N.Kravtsov (A.N. Nesmeyanov Inst. of Heteroorganic Compounds, Acad. of Sci., USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.914-18 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.108-12 (Nov.-Dec. 1982). [received: Sept. 1983]
For pt.XXI see ibid., vol.23, no.1, p.102 (1982). The structure of triphenyltin 2-dimethylaminothiophenolate was determined by X-ray diffraction ($R=0.0271$ for 5365 reflections). The tin atom has trigonal-bipyramidal coordination with the sulfur atom in the equatorial position (Sn-S 2.429 (1) Å) and the nitrogen atom in the axial position (Sn-N 2.893 Å). Some lengthening of the axial Sn-C bond (2.172(3) Å) is noted relative to the equatorial Sn-C bonds (2.142(5) and 2.127(6) Å). The dimethylamino group has pyram-

idal structure. The nitrogen unshared electron pair is oriented toward the tin atom. (16 refs.)

- 113841** Growth structure and optical properties of single crystals of rubrene. I.V.Bulgarovskaya, V.M.Vozzhennikov, S.B.Aleksandrov, V.K.Bel'skii. *Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.53-9 (1983). In Russian.
The single crystals of rubrene $\text{C}_{42}\text{H}_{28}$ are grown by sublimation in the atmosphere of an inert gas, and an X-ray diffraction study is reported (diffractometer λMo , 669 reflections, by LSM in the anisotropic approximation to $R=0.032$). These are rhombic crystals, $a=7.184$, $b=14.433$, $c=26.897$ Å, $Z=4$, space group B, b, a, m . The inherent rubrene molecular symmetry in a crystal is $2/m$. The naphthalene nucleus on the whole is plane, the phenyl cycles are turned at an angle of 80.5° with respect to the midplane nucleus. The longwave absorption band of the rubrene crystal (max. 500, 472 and 439 nm) is in a good agreement with the analogue absorption band of the naphthalene crystal (max. 503, 472 and 439 nm). The dipole transition moments in the crystal of the translation non-equivalent molecules are parallel, being a cause of the absence of Davydov splitting in the absorption spectrum. The photoconduction and absorption spectra of the single crystal are negatively correlated. The photoconduction threshold has the value of 2.0 eV. (13 refs.)
- 113842** Structural analysis of the complex compound $[\text{Cr}(\text{OCN}_2\text{H}_4)_6][\text{Co}(\text{DH})_2(\text{NO}_2)_4]_2 \cdot 0.5\text{I}^- \cdot 0.5\text{X}^- \cdot n\text{H}_2\text{O}$. V.G.Rau, V.I.Bondar', V.V.Ilyukhin, Yu.T.Struchkov, N.V.Belov (P.I. Lebedev-Polyanski State Pedagogical Inst., Vladimir, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.998-1000 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1128-31 (Dec. 1982). [received: Sept. 1983]
The incompleteness of the Patterson function with respect to the 'light' fragment of a structure often requires that during the interpretation uses special Fourier syntheses whose structure is based on knowledge of the 'heavy' fragment of the basic system. In this case the choice of method for finding the solution is determined by probabilistic characteristics calculated within the framework of a generalized probabilistic approach, and the better one knows the chemical composition of the compound and the distinctive features of its structure, the more exact the recommendations that this approach gives. In the structure of the compound $[\text{Cr}(\text{OCN}_2\text{H}_4)_6][\text{Co}(\text{DH})_2(\text{NO}_2)_4]_2 \cdot 0.5\text{I}^- \cdot 0.5\text{X}^- \cdot n\text{H}_2\text{O}$ of incompletely known chemical composition, notwithstanding the likelihood of the appearance of maxima corresponding to the 'heavy' (I, Co, Cr) part of the basic system, the interpretation was complicated considerably by the formation of a 'grid' Cochran fragment in the vector system (VS) of the compound. The authors consider stages in the interpretation of the VS of the given structure with allowance for the homometric properties which manifested themselves. (4 refs.)
- 113843** Crystal structure of $[\text{Cr}(\text{OCN}_2\text{H}_4)_6][\text{Co}(\text{NH}_3)_2(\text{NO}_2)_4]_3 \cdot 0.5\text{CCl}_4 \cdot 1.5\text{H}_2\text{O}$. V.G.Rau, V.I.Bondar', T.F.Rau, V.V.Ilyukhin, Yu.T.Struchkov, N.V.Belov (P.I. Lebedev-Polyanski State Pedagogical Inst., Vladimir, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1000-2 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1371-3 (Dec. 1982). [received: Sept. 1983]
This compound was obtained by adding carbon tetrachloride to an aqueous solution of $[\text{Cr}(\text{OCN}_2\text{H}_4)_6][\text{Co}(\text{NH}_3)_2(\text{NO}_2)_4]_3 \cdot 3\text{H}_2\text{O}$. The authors carried out an X-ray analysis of the resulting product $[\text{Cr}(\text{OCN}_2\text{H}_4)_6][\text{Co}(\text{NH}_3)_2(\text{NO}_2)_4]_3 \cdot 0.5\text{CCl}_4 \cdot 1.5\text{H}_2\text{O}$ with a view to making a further analysis of the structure of the chromium-urea complex in complicated hetero-complex compounds. From the methodological point of view they continued their study of the incomplete Patterson function with a heavy fragment, the degree of incompleteness and the search for methods of interpretation of which were determined by means of the generalized probabilistic approach. (3 refs.)
- 113844** The crystal structure of ytterbium formate dihydrate, and morphotropy in the series $\text{Ln}(\text{HCOO})_3 \cdot 2\text{H}_2\text{O}$. N.G.Furmanova, L.V.Soboleva, L.I.Khapaeva, N.V.Belov (Inst. of Crystallography, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.30-3 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.62-6 (Jan.-Feb. 1983). [received: Sept. 1983]
From formic-acid solutions of anhydrous formates, one obtains crystals of $\text{Yb}(\text{HCOO})_3 \cdot 2\text{H}_2\text{O}$ and two modifications of $\text{Tm}(\text{HCOO})_3 \cdot 2\text{H}_2\text{O}$; Tm_I , which belongs to a previously investigated isostructural series, and Tm_{II} . The authors have made an X-ray structural analysis of $\text{Yb}(\text{HCOO})_3 \cdot 2\text{H}_2\text{O}$ (method of least squares in anisotropic approximation, $R=0.081$ for 1920 reflections). Of the three formate groups, two are bidentately cyclic, and one is bidentately bridging. In the crystal the bridging formate groups form chains along [001], linked into layers by H bonds. It is found that the dihydrates Tm_{II} and Yb formate are isostructural, and the morphotropic transition Tm in the series $\text{Ln}(\text{HCOO})_3 \cdot 2\text{H}_2\text{O}$ with $\text{Ln}=\text{Tb-Yb}$ is thus fixed. (9 refs.)
- 113845** Structure of salts of arylthioniacycloalkanes with a hydroxy group in the benzene ring. VIII. The crystal structure of 1-(2,5-dihydroxyphenyl)-thianium chloride monohydrate. D.S.Yufit, A.I.Yanovskii, A.E.Kalinin, Yu.T.Struchkov, L.R.Barykina, I.N.Degtyareva (Inst. of Heteroorganic Compounds, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.40-2 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.79-83 (Jan.-Feb. 1983). [received: Sept. 1983]
For pt.VII see *Kristallografiya*, vol.27, p.258 or *Sov. Phys. Crystallogr.*, vol.27, p.158 (1982). The authors have made X-ray structural and IR spectroscopic investigations of 1-(2,5-dihydroxyphenyl)-thianium chloride monohydrate, $[\text{C}_6\text{H}_4\text{SO}^+\text{C}_6\text{H}_3(\text{OH})_2]\text{Cl}^- \cdot \text{H}_2\text{O}$, which has four symmetrically independent H bonds. The OH group in the ortho position is associated with the chlorine atom, the OH group in the meta position is associated with the oxygen atom of the water molecule, and the hydrogen atoms of the water form H bonds with chlorine atoms. Thus each chlorine atom is a proton acceptor for three hydrogen bonds simultaneously. The energies of the H bonds involving the hydroxyl groups are 7.4 ± 0.9 kcal/mole; the energies of the H bonds between the chloride anions and the water molecules are 5.0 ± 0.1 kcal/mole and 5.60 ± 0.04 kcal/mole. The conformation of the thianium ring is of the chair type; the sulfur atom has pyramidal bond configuration. (13 refs.)
- 113846** Crystal and molecular structures of *p*-nitrophenyl vinyl ether. D.S.Yufit, A.I.Yanovskii, Yu.L.Frolov, Yu.T.Struchkov (Inst. of Heteroorganic Compounds, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.43-4 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.84-6 (Jan.-Feb. 1983). [received: Sept. 1983]
The authors have made an X-ray structural analysis of *p*-nitrophenyl vinyl ether. They have determined the angles corresponding to the rotations of the benzene ring (27.4°) and vinyl group (36.6°) relative to the C-O-C plane. On

the basis of a comparison of the results with the IR and UV spectra, they advance the hypothesis that there are no appreciable changes in the molecular structure when the substance is dissolved in neutral solvents. (12 refs.)

113847 Crystal and molecular structures of 2,2'-dimethoxy-1,1'-dinaphthyl. G.V.Gridunova, V.E.Shklover, Yu.T.Struchkov, B.A.Chayonov (Sci.-Res. Inst. of Organic Intermediate Products & Dyes, USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.45-7 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.87-91 (Jan.-Feb. 1983). [received: Sept. 1983]

The authors have made an X-ray structural investigation of 2,2'-dimethoxy-1,1'-dinaphthyl. The molecule lies on the dyad axis. The slight increase in the length of the exocyclic C-O bond to 1.396(6) Å and the increase in the opposite endocyclic angle to 124.1(5)° apparently indicate that the methoxy substituent is an electron acceptor. The dihedral angle between the planes of the naphthyl groups within the molecule is 111°. (15 refs.)

113848 Structure of electrically conducting complexes based on cation radicals. IX. The cation-radical salt of tetraselenotetracene with the dibromocuprate anion (TSeT)⁺(CuBr₂)⁻. R.P.Shibaeva, V.F.Kaminskii, E.B.Yagubskii, L.A.Kushch (Inst. of Chem. Phys., Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.48-50 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.92-5 (Jan.-Feb. 1983). [received: Sept. 1983]

For pt.VIII see *Kristallografiya*, vol.16, p.1224 or *Sov. Phys. Crystallogr.*, vol.26, p.695 (1981). The authors have made an X-ray structural investigation of the cation radical salt TSeT⁺(CuBr₂)⁻ (*a*=12.478 Å, *b*=9.997 Å, *c*=3.859 Å, α =96.70°, β =86.28°, γ =111.35°, space group P1). The structure was refined by the method of least squares to *R*=0.056. It contains infinite (along *c*) regular stacks of cation radicals TSeT⁺ with an interplanar distance TSeT⁺...TSeT⁺ of 3.55 Å. The CuBr₂⁻ anions have a very distorted linear configuration with the BrCuBr angle equal to 154°, and form zigzag chains, in which one of the Br atoms is bridging, extending along the direction of the cation-radical stacks. (12 refs.)

113849 Chelate-forming derivatives of 8-hydroxyquinoline. V. A complex dimer cation involving a protonized molecule in the crystal structure of bis-(8-hydroxy-2-quinolyl)amine. I.N.Polyakova, Z.A.Starikova, B.V.Parusnikov, I.A.Krasavin (All-Union Sci.-Res. Inst. of Chem. Reagents & Very Pure Chem. Substances, USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.50-3 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.96-101 (Jan.-Feb. 1983). [received: Sept. 1983]

The crystal structure of bis-(8-hydroxy-2-quinolyl)amine (AMIN-4) (diffractometer, method of least squares in anisotropic approximation to *R*=0.037) consists of complex dimer cations and OH⁻ anions. The cation is formed on account of a short H bond O...H...O (O...O=2.437 Å) between two AMIN-4 molecules, one of them being the hydroxy form protonized at N_{ox}, the other a bipolar ion, the independent part of the cation (its intrinsic symmetry is C₂) contains hydroxyquinoline and hydroxyquinolinium fragments; their combination in one molecule enables the authors to make a correct comparison of their geometries. Within the cation there are intramolecular H bonds N-H...N (N...N=2.606 Å), N-H...O (N...O=2.644 Å), and O-H...O (O...O=2.741 Å). (11 refs.)

113850 The crystal structure of [(CH₃)₂SiCH₂]₂SnF. L.N.Zakharov, Yu.T.Struchkov, E.A.Kuz'min, B.I.Petrov (Physicotech. Res. Inst., Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.158-61 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.271-5 (March-April 1983). [received: Sept. 1983]

An X-ray structural investigation of [(CH₃)₂SiCH₂]₂SnF is made with the aim of elucidating the cause of the fact that organometallic compounds containing the substituent R=(CH₃)₂SiCH₂ are more thermostable than their alkyl analogs with less complex (unbranched) R. The crystal structure consists of one-dimensional chains of molecules in which the plane-trigonal [(CH₃)₂SiCH₂]₂Sn groups are linked by symmetrical bridges of F atoms, making up the coordination of the Sn atom to trigonal-bipyramidal. The Sn-F bonds in the chain are ionic-covalent. The crystal structure of [(CH₃)₂SiCH₂]₂SnF differs from the structures of [(CH₃)₂SiCH₂]₂SnI and (CH₃)₂SiSnF, which have been described previously. (24 refs.)

113851 Crystal and molecular structure of the 1:1 complex of 7,7,8,8-tetracyanoquinodimethane and 9,9'-trans-bis-telluraxanthenyl (C₁₂H₄N₄)(C₂₆H₁₈Te₂). R.M.Lobkovskaya, R.P.Shibaeva, O.N.Ermenko (Inst. of Chem. Phys., Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.161-3 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.276-9 (March-April 1983). [received: Sept. 1983]

The authors have made an X-ray structural investigation of crystals of the complex (C₁₂H₄N₄)(C₂₆H₁₈Te₂) (*a*=8.878 Å, *b*=10.602 Å, *c*=10.275 Å, β =80.25°, γ =116.03°, space group P1, Z=1). The structure contains stacks of alternate donor (D) and acceptor (TCNQ) molecules with a mean interplanar distance of 3.37 Å. The D molecule lies at the center of symmetry and consists of two parts joined by a single bond C(sp²)-C(sp²)=1.586 Å, with the 'butterfly' conformation. The mean length of the Te-C(sp²) bond is 2.112 Å. The angle of bending of the three-ring system about the Te...C(sp²) line is 141°. (7 refs.)

113852 X-ray structural investigation of perfluoro-3,3,6,6,4',4'',4'''-octamethyl-1,2,4,5-dicyclobutenocyclohexa-1,4-diene, C₁₈F₂₈. M.Yu.Antipin, Yu.T.Struchkov, N.I.Delyagina, I.L.Knunyants (Inst. of Heteroorganic Compounds, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.163-6 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.280-5 (March-April 1983). [received: Sept. 1983]

The authors have made an X-ray structural investigation (diffractometer, direct method, method of least squares to *R*=0.095 from 1462 reflections) of the compound C₁₈F₂₈—the product of the reaction of chloroform with perfluoroisobutylene in the presence of cesium fluoride. They have found that the compound is an unsaturated perfluorooctamethyl-1,2,4,5-dicyclobutenocyclohexa-1,4-diene in which all the carbon atoms in the three-ring framework are practically collinear. The values of the geometric parameters of the molecule indicate that there are marked steric stresses due to the large number of bulky, electronegative CF₃ groups. (13 refs.)

113853 Crystal and molecular structure of tetracyclic nitroxyl biradical with three bridging bonds between the piperidine and dehydropiperidineoxyl fragments, C₂₂H₃₆N₂O₄. R.M.Lobkovskaya, R.P.Shibaeva, M.V.Sudnik, A.B.Shapiro (Inst. of Chem. Phys., Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.170-2 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.291-5 (March-April 1983). [received: Sept. 1983]

The authors have made an X-ray structural investigation of the stable nitroxyl biradical C₂₂H₃₆N₂O₄ (*a*=11.340 Å, *b*=12.425 Å, *c*=8.360 Å, α =110.28°, β =100.77°, γ =93.98°, space group P1, Z=2). They show that

two of the six-membered hetero rings in the nitroxyl have chair conformation and one has half-boat conformation, while the five-membered hetero ring has envelope conformation. The mean length of the N-O bonds is 1.277(2) Å. For the paramagnetic centers in the crystal, the intermolecular distances are shorter than the intramolecular distances. (7 refs.)

113854 Structure of electrically conducting complexes based on cation radicals. X. Cation-radical salts of tetrathiotetracene and tetraselenotetracene with hexabromodimercure dication, (TTT)₂²⁺(Hg₂Br₆)²⁻ and (TSeT)₂²⁺(Hg₂Br₆)²⁻. R.P.Shibaeva, V.F.Kaminskii (Inst. of Chem. Phys., Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.173-6 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.296-302 (March-April 1983). [received: Sept. 1983]

For pt.IX see *Kristallografiya*, vol.28, p.92 (1983) or *Sov. Phys. Crystallogr.*, vol.28, p.48 (1983). The authors have made an X-ray structural investigation of the cation-radical salts (TTT)₂(Hg₂Br₆) (*a*=14.155 Å, *b*=17.776 Å, *c*=10.752 Å, α =94.06°, β =100.33°, γ =96.87°, space group I1, Z=2) and (TSeT)₂(Hg₂Br₆) (*a*=10.617 Å, *b*=13.471 Å, *c*=10.582 Å, α =111.73°, β =100.92°, γ =81.77°, space group P1, Z=1). The structures are refined by the method of least squares to *R*=0.062 and *R*=0.049, respectively. The structures contain stacks of cation radicals parallel to the *c* direction with interplanar distances of TTT-TTT=3.44 Å and TSeT-TSeT=3.49 Å. The anionic part of the structure consists of centrosymmetric dimers (Hg₂Br₆)²⁻. (13 refs.)

113855 A new method of the calculation of the hydrogen trap activation energy in metals. K.Y.Lee, J.-Y.Lee (Dept. of Materials Sci. & Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea). *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.538-40 (Sept. 1983).

When several types of trapping site exist in one specimen several corresponding thermal analysis peaks will appear from the low temperature to the high temperature region at a heating rate. The trap activation energy, *E*_{tr}, for low temperature peaks can be calculated from the existing experimental data. The authors show how it is possible to calculate *E*_{tr} for the high temperature peaks without further experiments using an equation. (3 refs.)

113856 High resolution electron microscopy study of phosphate tungsten bronzes KP₂O₈(WO₃)_{2m}. I. Investigation of non-integral and high *m* values: defects resulting from intergrowths and interruption of 'P₂O₇' rows. M.Hervieu, B.Raveau (Lab. de Cristallographie, Univ. de Caen, Caen, France). *Chem. Scr. (Sweden)*, vol.22, no.3, p.117-22 (1983).

Previous investigations have reported the existence of a series of phosphate tungsten bronzes A₂P₂O₈(WO₃)_{2m} for integral *m* values ranging from 5 to 10. The authors' work deals with the high resolution electron microscopy study of the non integral *m* compositions and high *m* values (*m*>10). Crystals corresponding to these nominal compositions were frequently imperfect, contrary to the intermediate *m* values (5≤*m*≤10). However microcrystals corresponding to integral values higher than 10 have been isolated and characterized. This first part concerns phenomena related to intergrowths and defects resulting from the interruption of P₂O₇ rows. Two coherent intergrown phases have been observed for the lowest *m* values. The specific defects corresponding to the interruption of P₂O₇ rows in the ReO₃-type matrix confirms the great adaptability of the P₂O₇ groups to the ReO₃ type framework. (13 refs.)

113857 Planar defect in A15 structure observed in Cr-Si fine particles. T.Ishimasa, Y.Fukano (Coll. of General Education, Nagoya Univ., Nagoya, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1092-7 (July 1983). A new planar defect in the A15 structure was found in fine particles formed by the evaporation of Cr-Si alloy in Xe gas. Electron microscopic analysis showed that the planar defect lies on the {100} plane and the displacement vector due to the defect is <±1/8, 1/2, 0>*a*. A probable model of the defect is proposed. (9 refs.)

113858 A representation of the defect structure of pure barium titanate. J.F.Baumard, P.Abelard (Centre de Recherches sur la Phys. des Hautes Températures, CNRS, Orleans, France), D.M.Smyth.

Rev. Int. Hautes Temp. & Refract. (France), vol.20, no.1, p.3-16 (1983). In ternary oxides such as barium titanate, BaTiO₃, the concentration of point defects responsible for a departure from stoichiometry at constant total pressure depends on three thermodynamic variables, generally chosen as the temperature and two activities. As a consequence, the thermodynamic state of the compound may be represented by a point in a three-dimensional space, the coordinates of which are the temperature and two activities. Isothermal sections of this space are developed, in which domains of existence of majority defect pairs are established once a suitable intrinsic disorder has been selected. Such representations appear to be complementary to Kroger and Vink diagrams, as they allow a systematic study of point defects in ternary oxides. (23 refs.)

113859 Creation of point defects in superconductors. A short review. Y.Quere, F.Rullier-Albenque (SESI, CEN, Fontenay-aux-Roses, France). *Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982)*, p.609-13

Many experiments have been published concerning the radiation damage in superconductors, but relatively few about the mechanisms of defect creation. A short review is presented of what is known on point defect creation in superconductors either by coldwork or by irradiation. (21 refs.)

- 113860 Free energy calculation of small clusters.** G.Martin (Section de Recherches de Metall. Phys., CENS, Gif-sur-Yvette, France), A.Perini, G.Jacucci.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.718-21.
A new Monte Carlo technique is proposed to compute directly the free energy difference of two clusters of $N+1$ and N particles. The algorithm has been checked on the 2-dimensional lattice gas model with nearest neighbour interactions and produced high accuracy data. The results match very well the predictions of capillarity approximation down to $N \approx 10$ provided that the logarithmic correction $\tau \ln N$ is included; $\tau = 1.25$ in agreement with most recent theoretical predictions. 61.70B Interstitials and vacancies

(exc. colour centres)

- 113861 Defects in quenched and annealed Al-Ge alloys.** H.Murakami, I.Kanazawa, Y.Tsumigi (Dept. of Phys., Tokyo Gakugei Univ., Tokyo, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1066 (June 1983).
In a study carried out using transmission electron microscopy, it was found that the small clusters formed in the quenched alloys annihilate through vacancy emission during annealing at 423K; and dislocation loops, formed together with the clusters, grow by the absorption of vacancies emitted by the clusters. (6 refs.)
- 113862 The calculated defect structure of thorium.** E.A.Colbourn, W.C.Mackrodt (New Sci. Group, ICI plc, Runcorn, England).
J. Nucl. Mater. (Netherlands), vol.118, no.1, p.50-9 (Aug. 1983).
The calculated energies of lattice and electronic disorder in thorium are outlined. From these the fundamental defect structure, electronic energy levels and oxidation-reduction potentials are deduced. This enables the reported diffusion and electrical conductivity data to be reassessed and alternative defect mechanisms for these processes to be suggested. (41 refs.)
- 113863 A quantitative study of vacancy defects in quenched tungsten by combined field-ion microscopy and electrical resistometry.** J.Y.Park (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA), H.-C.W.Huang, R.W.Siegel, R.W.Balluffi.
Philos. Mag. A (GB), vol.48, no.3, p.397-419 (Sept. 1983).
A study of quenched, high-purity tungsten has been carried out with a combination of field-ion microscopy (FIM) and electrical resistivity measurements. It is concluded that the quenched-in vacancy defects observed by FIM are monovacancies and nearest-neighbour divacancies. From the partitioning during quenching between these two species, a divacancy binding enthalpy $H_{2v}^b \approx 0.7$ eV is deduced. A monovacancy resistivity of $7 \times 10^{-4} \Omega$ cm is obtained from the combined measurements. The quenched-in vacancy concentrations measured directly by FIM are consistent with previous results, if the total vacancy concentration at the melting temperature of tungsten (3695K) is about 3×10^{-4} and the monovacancy formation enthalpy and entropy are 3.6 eV and 3.2k, respectively. The results are discussed in terms of the atom-defect mechanisms for self-diffusion in tungsten. (28 refs.)
- 113864 Mobilities of quenched-in defects in NiAl.** Tian-Min Wang, M.Shimotomai, M.Doyama (Dept. of Materials Sci., Univ. of Tokyo, Tokyo, Japan).
Philos. Mag. A (GB), vol.48, no.3, p.L5-7 (Sept. 1983).
Samples of the intermetallic compound NiAl have been quenched from 800-1400°C and their recovery behaviour studied by positron annihilation techniques. Two distinct recovery stages were found by Doppler broadening measurements, one at around 280°C and the other at around 500°C. It is

shown that vacancies anneal out at the latter stage. The former stage is ascribed to the migration of divacancies to form voids. (7 refs.)

- 113865 Estimation of the vacancy formation enthalpy of metals.** A.R.Patete, J.P.Neumann (Dept. of Metall. Engng., Univ. of Alabama, University, AL, USA).
Ser. Metall. (USA), vol.17, no.8, p.1047-8 (Aug. 1983).
Examines the work of Neumann (see *Acta Metall.*, vol.28, p.1165, 1980) and Tiwari and Patil (see *Scripta Metall.*, vol.9, p.833, 1975) both concerning the vacancy formation enthalpy (ΔH_v) of metals. The present authors attempt to explain the considerable discrepancy that exists between the ΔH_v values predicted by the two different correlations. (12 refs.)
- 113866 New exciton mechanism for the formation of Frenkel defects in ionic crystals.** P.K.Khabibullaev, S.Dzhumanov (Inst. of Nuclear Phys., Acad. of Sci., Ulugbek, Uzbek SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1050-1 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1361-3 (Dec. 1982). [received: Sept. 1983].
The excitation of excitons in alkali-halide and fluorite crystals leads to the formation of Frenkel pairs of effects (F-H pairs). However, the mechanism for this effect is not completely understood. The mechanisms which have been proposed earlier first of all do not consider all the stages of the exciton-defect transformation and, secondly, predict that the defect production is temperature dependent in all alkali-halide crystals, a prediction which is not borne out by experiment. The authors develop a theory of the exciton mechanism for the formation of defects in ionic crystals. (10 refs.)
- 113867 Distribution of the internal distances in Frenkel pairs in irradiated silicon and germanium.** A.N.Kraichinskii, L.V.Mizrukhn, V.I.Shakhovtsov (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Semicond. (USA), vol.17, no.3, p.269-72 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.437-40 (March 1983). [received: Sept. 1983].
A model is proposed for the process of formation of defects in semiconductors in which the components of Frenkel pairs are mobile during irradiation. The model is based on the screening of these components by equilibrium or nonequilibrium carriers. A study is made of the possibility of deriving the distribution function of the internal distances in genetic Frenkel pairs using the experimental dependences of the defect formation efficiency on the rate of electron irradiation or on the concentration of dopant impurities. A calculation is made of the distribution function of the internal distances in Frenkel pairs formed in silicon and in germanium. (8 refs.)
- 113868 Effects of relaxation round point defects in the alkali metals on formation energies.** F.Flores (Dept. del Estado Solido, Univ. Autonoma, Madrid, Spain), N.H.March.
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.85-92.
Vacancy and interstitial formation energies in the nearly-free electron alkali metals Na and K are studied using a model of complete relaxation. It is argued then that the interstitial with the lowest formation energy is that in which the relaxed near-neighbour configuration most closely resembles the local relaxation round the vacancy. For this configuration, the ratio of interstitial to vacancy formation energy is calculated. Reasonable estimates show that the formation energy of the interstitial in Na is only some hundredths of an electron volt higher than that for the vacancy. The interest for diffusion mechanisms in Na and K is emphasized. (6 refs.)
- 113869 Point defects and radiation effects in BCC metals.** W.Frank (Max-Planck-Inst. fur Metall., Stuttgart, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.203-8.
Gives an overview of scientific knowledge on intrinsic point defects in α -Fe and Ta deduced from equilibrium experiments (self-diffusion, positron annihilation) and steady-state experiments (growth of dislocation loops under irradiation in a transmission electron microscope) at elevated temperatures as well as from non-equilibrium studies (electrical resistivity, internal friction, magnetic after-effect, positron annihilation) performed at low temperatures after particle irradiation, cold-work, or quenching. It is shown that the one-interstitial model fails to explain the observations. By contrast, in the two-interstitial model a natural and internally consistent interpretation is possible, which may be extended to the other BCC refractory metals. (41 refs.)
- 113870 On the validity of the one- and two-interstitial models.** W.Schule (Materials Sci. Div., Joint Res. Centre, Ispra, Italy).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.209-12.
Attention is focused on inconsistencies of results of experiments with predictions of the one-interstitial model, e.g. the stage III dilemma. It is then shown that results of measurements of radiation enhanced self-diffusion in nickel and of the radiation damage rate performed in many different laboratories are not consistent with the predictions of the two existing radiation damage models. It is found from the above-mentioned experimental results that the recombination volume between self-interstitials and vacancies, and between defects and defect clusters, must be of the order of $2 \cdot 10^3$ and 10^5 atomic volumes, respectively, and that the migration activation energies of defects decreases with increasing irradiation flux because of an interaction between the high energy particles with the lattice atoms. A modified two-interstitial model is presented which contains these new features. (15 refs.)
- 113871 Defects in copper studied by PAC between 10K and 800K.** M.Deicher, G.Grubel, R.Minde, E.Reckagel, Th.Wichert (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.220-3.
The perturbed angular correlation technique (PAC) is used to clarify the defect situation in copper between stages I and V. The experimental results obtained for self-interstitials, vacancies and defect clusters under different damaging conditions are shown. Their microscopic interpretation within the scope of the results of complementary experimental methods is discussed. (10 refs.)
- 113872 Intrinsic thermal expansion of point defects in metals.** J.P.Ganne, Y.Quere (Section d'Etudes des Solides Irradies, CEN, Fontenay aux Roses, France).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.232-5.
The intrinsic thermal expansion coefficient of various intrinsic or extrinsic point defects has been measured. For radiation defects in aluminium, the authors have found a high value of its ratio to the matrix coefficient

($\beta_D/\beta_0=12$). This result confirms the idea that a point defect may be strongly anharmonic. Many data on dilute copper alloys are given. Comparison with theoretical calculations is made when possible. (12 refs.)

113873 Thermal generation of vacancies in aluminum. T.Kino, K.Ono (Lab. of Crystal Phys., Hiroshima Univ., Hiroshima, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.247-52.
Thermal generation of vacancies from dislocations, faulted loops and octahedral voids in zone refined aluminum were investigated by means of the pulse heating technique. These sources were examined by an electron microscope to determine their densities and sizes. The concentration of vacancies generated from the faulted loops and small voids attained to over-saturation within 10 m sec, but the ones from dislocations and large voids did not exceed the equilibrium concentration. Especially in the case generation from dislocations, it took a long time to attain the equilibrium level. These differences in the generation profile are explained by the characteristic energy to promote or suppress the generation of a vacancy from various sources. (13 refs.)

113874 Vacancy clustering during oxidation of nickel, magnesium, and zinc. C.G.Deacon, M.H.Loretto, R.E.Smallman (Dept. of Metall. & Materials, Univ. of Birmingham, Birmingham, England). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.253-6.
Specimens of nickel have been oxidised at 1000°C and measurements of weight gain, density change, length change and void density have been made together with measurements of the stress exerted by the oxide on the metal in an attempt to understand the origin of vacancy clusters found during the oxidation of nickel. Observations have also been carried out of the oxide-metal interface of oxidised Mg and Zn single crystals of (1120) and [0001] orientations. The observations are discussed in terms of the role of vacancy injection, stress and gas in void formation. (4 refs.)

113875 Properties of point defects in FCC metals. W.Schule, R.Scholz (Materials Sci. Div., Joint Res. Centre, Ispra, Italy). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.257-60.
The resistivity changes due to vacancies in copper, silver and gold were determined by: (i) quenching from temperatures between 300 and 600°C and by (ii) making measurements of the electrical resistivity as a function of the temperature between ambient temperature and the melting temperature. The resulting resistivity changes due to vacancies were much larger than those reported so far in the literature which were mainly obtained by quenching from high temperatures. The authors analysed their data together with results obtained in other laboratories by Simmons and Balluffi by quenching, by measurements of self-diffusion coefficients and of the isotope effect, and by positron annihilation. The metals nickel, aluminium and platinum were also included in this analysis and information was obtained on E_{IV}^F , E_{IV}^M , E_{2V}^M , E_{2V}^F , S_{IV}^F and S_{2V}^F . (11 refs.)

113876 Vacancies in silver: a resistivity and positron annihilation study. J.Hillairet, C.Mairy (Dept. de Recherche Fondamentale, CENG Grenoble, Grenoble, France), C.Minier, P.Hautajarvi, A.Vehanen. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.284-7.
Resistivity and positron lifetime measurements were performed to follow the annealing of the vacancy defects in quenched or irradiated high purity silver. For quench temperatures in the range 400°C to 500°C, the quenched-in resistivity is restored in one single stage centered at 40°C. An activation energy of 0.64±0.06 eV is inferred for the migration of the single vacancies. This result together with information derived from the evolution of positron lifetime spectra leads to the conclusion that stage III is to be assigned to monovacancy migration. Further results obtained in α -AgZn solid solutions support this view. (20 refs.)

113877 Vacancy-thermal expansion in aluminium. Ph.Audit (Lab. PMTM, Univ. Paris-Nord, Villetaneuse, France). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.291-3.
Using thermodynamics the author has derived a temperature-differential equation for the vacancy formation volume in terms of the bulk modulus and the static ion displacements. Combining the DRT interionic potentials with a lattice statics calculations of the displacements one is able to solve the equation for the vacancy formation volume as a function of temperature. The author obtains values of the vacancy thermal expansion coefficient ranging between 4.4 β_0 at T=250K and 12.6 β_0 at 800K where β_0 is the perfect crystal coefficient. (7 refs.)

113878 Configurations of point defects in neutron-irradiated iron. M.Weller, J.Diehl (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.417-20.
High purity iron part of it doped with 150 at.ppm carbon, was irradiated with 3.10^{17} n/cm² at 20K. The internal friction (1 Hz) of poly and monocrystals with (110) or (100) oriented torsion axes was measured (starting at 4K) after irradiation and after annealing treatments between 170K and 385K. From the anisotropy of the relaxation strength conclusions are drawn on the configurations of reorientating (anisotropic) point defects such as SIAs (self interstitial atoms), SIA-clusters, SIA-carbon and vacancy-carbon complexes. (7 refs.)

113879 Submicroscopic vacancy defects in pure and doped gold. C.Corbelle (CEN, Fontenay-aux-Roses, France), P.Moser. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.445-8.
A positron lifetime investigation of the annealing behaviour of irradiated pure Au and doped Au with the solute Sb, Ge and Fe atoms shows that submicroscopic vacancy clusters are formed during the stage III. In doped Au, they are heterogeneously formed which enhances their density in Au-Ge, enhances their average size in Au-Sb and delays their formation in Au-Fe. Mobile vacancy-solute Sb or Ge complexes are involved in the clustering process in Au-Sb and Au-Ge. (7 refs.)

113880 Vacancy formation in Ni and Ni(Ge). L.C.Smedskjaer, M.J.Flus, D.G.Legnini, M.K.Chason, R.W.Siegel (Materials Sci. Div., Argonne Nat Lab., Argonne, IL, USA). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.449-52.
Vacancy formation in Ni and Ni(1 at.% Ge) was studied under thermal equilibrium conditions using positron annihilation Doppler-broadening. A monovacancy formation enthalpy of 1.8 ± 0.1 eV was determined for pure Ni; combining this result with those from previous tracer self-diffusion measurements, a monovacancy migration enthalpy of 1.1 ± 0.1 eV was also deduced. An effective vacancy formation enthalpy of 1.4 eV was found for Ni(1 at.% Ge). Using a model to simulate the free and bound-vacancy ensemble in the alloy, a value of 0.7 eV was obtained for the formation enthalpy of Ge-bound vacancies. The results are compared with previous theoretical and experimental results. (14 refs.)

113881 Behavior of point defects in ice crystals revealed by X-ray topography. T.Hondoh, T.Itoh, A.Higashi (Dept. of Appl. Phys., Hokkaido Univ., Sapporo, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.599-601.
Formation process and behavior of various features of dislocation loops and minute defects found in ice crystals subjected to heat treatment were investigated by X-ray diffraction topographic method. It was found that dominant point defects in ice are interstitials at temperatures above -50°C, while they are vacancies below -50°C. Formation energies of both interstitials and vacancies are discussed in the light of new data of equilibrium concentrations of both defects in the authors' studies. (7 refs.)

113882 Defects and diffusion in intermetallic compounds. G.Frohberg, H.Weber (Inst. fur Metallforschung, Tech. Univ. Berlin, Berlin, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.614-18.
In the intermetallic compounds γ -Cu₃Sn and β -CoGa the formation enthalpy of vacancies strongly depends on vacancy concentration. Theoretical investigations yield the same result. Thus it is possible to explain the existence of structural vacancies in terms of usual thermodynamic relations. The diffusion mechanism in these compounds is discussed on the basis of recent experimental results. (10 refs.)

113883 Point defects in BCC Fe-Al, Fe-Co, and Fe-Co-V ordered alloys. J.P.Riviere, J.F.Dinhut (Lab. de Metall. Phys., Univ. de Poitiers, Poitiers, France). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.619-26.
Radiation damage produced at 20K by 2.5 MeV electrons is studied in three B₂ type Fe-40 at.% Al, Fe-Co, Fe-Co-V ordered alloys. The resistivity damage in Fe-40 at.% Al ordered single crystals is found less effective in the (111) directions. The results suggest that replacement collision chains are difficult to propagate along the (111) direction. Frenkel pair creation superimposed with disordering can account for the resistivity damage in the initially ordered Fe-Co alloy. Information concerning replacement collision sequences in (111) direction is derived. During the recovery of all the alloys, three main stages are observed and an ordering enhancement occurs. (30 refs.)

113884 Vacancies in B₂(CsCl) type ordered alloys. F.Nakamura, J.Takamura (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.627-30.
The formation of vacancies (structural and thermal vacancies) in the B₂ type ordered alloy is discussed with a model based upon the Bragg-Williams approximation assuming the nearest neighbor interaction, where A-, B-atoms and vacancies are allowed to be located on both α - and β -sublattices. Calculations were made of the composition dependence of the effective formation energy of thermal vacancies in NiAl alloys and also the temperature dependence of the positron annihilation parameter in a CuZn alloy, and the results successfully describe the experimental results in the literature. (13 refs.)

113885 Defect structures in β -NiAl and their response to electron irradiation. H.C.Liu, T.Mukai, T.E.Mitchell (Dept. of Metall., Case Western Reserve Univ., Cleveland, OH, USA). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.635-8.
Defect structures in β -NiAl alloys were studied by TEM. Diffuse rings of intensity maxima have been observed in diffraction patterns of both Ni-poor and Ni-rich NiAl, providing evidence for short-range ordering of structural point defects in β -Ni_{1-x}Al. Furthermore, diffuse streaks along (110) and (112) directions are also observed in diffraction patterns of 50, 55, 58 and 60 at.% Ni alloys. These diffuse streaks are related to pre-martensitic instabilities of Ni-rich NiAl. Electron irradiation by HVEM was found to destroy the short-range order. Irradiation of 50, 55 and 58 at.% Ni specimens at 700K created high densities of {001}{001} interstitial loops, but only created a low density of small defect clusters in 46 at.% Ni specimen. This is interpreted in terms of recombination of radiation-induced interstitials with the high concentration of structural Ni vacancies in Ni-poor NiAl. (10 refs.)

113886 Frenkel defects in Ni and Ni-base alloys. O.Bender, P.Ehrhart (Inst. fur Festkörperforschung, KFA, Jülich, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.639-42.
The defect structure produced by low temperature (4K) electron irradiation in single crystals of Ni, Ni₆₂Cu₃₈ and Ni₃Fe was investigated by measurements of the diffuse scattering of X-rays (Huang Diffuse Scattering), the change of the lattice parameter and the change of the electrical resistivity. The volume relaxation and the structure of the selfinterstitial atom (SIA) are very similar for the alloys and the pure FCC metals. The interstitial clustering processes during stage I and II proceed progressively more slowly in Cu, Ni, NiCu and Ni₃Fe respectively. In Ni₃Fe even the di-interstitial seems immobile up to stage III. The formation of large vacancy agglomerates during stage III annealing is only observed with the pure metals Ni and Cu. Interstitial mobility during annealing in stage II contributes to the decomposition of NiCu but not to the ordering of Ni₃Fe. There is an increase of order for highly ordered Ni₃Fe (S=0.7) during annealing in stage III and, within the errors, no change for samples with S=0. (8 refs.)

113887 Vacancies in concentrated alloys. M.Doyama (Dept. of Metall., Univ. of Tokyo, Tokyo, Japan), J.S.Koehler.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.643-6

The quasi-chemical approach has been applied to calculate the formation energies of a vacancy in pure metals and random concentrated binary alloys. The relation between the observed formation energies and the melting point (solidus temperature), and electron per atom ratio, and the ratio of the fractional concentration of alloying element to the solubility limit of the alloying element, and the Fermi energy are discussed. (4 refs.)

113888 A method for determining the vacancy concentration in concentrated alloys by resistivity measurements utilizing the rate of short range order formation. K.Lucke (RWTH Aachen, Aachen, Germany), H.Heidsiek, W.Kohl, R.Scheffel.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.647-52

A method is presented to determine the vacancy concentration in concentrated alloys by electrical resistivity measurements in cases in which the direct vacancy induced resistivity is negligibly small compared to the contributions due to changes in short range order. By assuming that the ordering rate as diffusion controlled is proportional to the vacancy concentration, the vacancy concentration can be determined, if the relationship between short range order and resistivity and the kinetics of ordering are known. For two different examples, Au15 at.% Ag and Ni11.4 at.% Cr, it is shown how to derive these relationships and the activation energies for formation and migration of vacancies and independently that for selfdiffusion. Also the annihilation kinetics of quenched-in vacancies can be derived in this way. (12 refs.)

113889 Formation and migration energies of a vacancy and kinetics of short range ordering in α -Cu-Al alloys. C.Kinoshita, M.Kutsuwada, T.Kamino (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.653-5

A general equation is derived which describes the time dependence of the vacancy concentration as well as the short-range ordering in binary substitutional alloys. The general equation is applied for an analysis of observed variation in electrical resistivity of α -Cu-Al alloys during isothermal annealing after quenching. It is shown that those data fit on a single master curve for each alloy by a suitable choice of the values for the formation and migration energies of a vacancy. (8 refs.)

113890 Self-interstitial mobility in a neutron-irradiated austenitic $\text{Fe}_{90}\text{Cr}_{16}\text{Ni}_{25}$ alloy. C.Dimitrov, M.Da Cunha Belo, O.Dimitrov (Centre d'Etudes de Chimie Metall., CNRS, Vitry, France).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.660-3

The annealing of the electrical resistivity of a $\text{Fe}_{90}\text{Cr}_{16}\text{Ni}_{25}$ austenitic alloy has been investigated after neutron irradiation at 23K to doses of 2.1×10^{17} to $2.7 \times 10^{18} \text{ n.cm}^{-2}$. The influence of defect concentration on recovery processes and determinations of activation energy were used for obtaining information on the point defect mobility. It is concluded that, in this alloy, the more mobile defects (probably self-interstitials) perform long range migration at a relatively high temperature ($\geq 190\text{K}$) with a migration energy of $86 \pm 6 \text{ kJ.mol}^{-1}$. Slower defects, probably vacancies, migrate with an energy of $128 \pm 7 \text{ kJ.mol}^{-1}$. (6 refs.)

113891 Detection of point defects and dynamic observation of defect interaction by atom resolution electron microscopy. H.Hashimoto, Y.Takai, N.Ajika, Y.Yokota, H.Endoh (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.698-701

Gold films containing a few percent silver are exposed to 2 MeV electrons to introduce the vacancy and stacking fault tetrahedra and are studied by an atom resolution electron microscope which can obtain the images of atoms at atom positions and TV system. Atom images with less bright contrast are attributed to the images of single vacancies by comparing the theoretical calculation. Stacking fault tetrahedra (SFT) with black and white contrast are studied. The contrast change of atom images in the region of SFT is attributed to the movement of vacancies. Contrast anomalies of the images of the twins and their intermittent growth are attributed to the included silver atoms. (5 refs.)

113892 Image contrast of single vacancies and small stacking fault tetrahedra in gold crystals studied by an atom resolution electron microscope. Y.Takai, N.Ajika, H.Hashimoto (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.702-4

Small stacking fault tetrahedra in gold crystals produced by the irradiation of 2 MeV electrons were observed in atomic scale by using a 100 kV high resolution electron microscope. By comparison with theoretical calculations, the smallest one observed with good contrast seems to be formed by several vacancies. Contrast anomalies which seem to be due to single vacancies were also observed and discussed by comparing with the calculated results by using a proposed model of a single vacancy. (5 refs.)

113893 Identification of small point defect clusters by high resolution electron microscopy. T.Nishida, K.Izui (JAERI, Ibaraki, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.705-7

Many beam lattice images of small point defect clusters such as interstitial loops, vacancy loops and voids in an aluminium crystal are calculated by using the multislice theory under various imaging conditions. High voltage Scherzer focus images are found to be useful for the identification of these point defect clusters. (5 refs.)

113894 High resolution electron microscopic observations of small point defect clusters and their thermal stability. Y.Shimomura, K.Kitagawa, Y.Takai, H.Hashimoto (Appl. Phys. & Chem. Dept., Hiroshima Univ., Hiroshima, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.708-11

Pure aluminium foils were irradiated at 130K with 200 keV electrons in an electron microscope and radiation induced point defect clusters were observed by the weak beam method. Vacancy clusters are formed only near the bottom surface. The number density of small vacancy clusters decreases at about

-50°C during warming up of irradiated specimens. In order to study the atomic structure of small point defect clusters in metals, high resolution structure image method have been carried out for small voids and dislocation loops in quenched pure aluminium. Details of structure of these small clusters were revealed clearly on the pictures. (no refs.)

113895 Studies of point defect clusters with an electron microscope. Y.Shimomura, K.Yamakawa, K.Kitagawa, H.Oda (Appl. Phys. & Chem. Dept., Hiroshima Univ., Hiroshima, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.712-17

Two related topics are reported briefly. One of the formation of voids in quenched pure aluminium and aluminium dilute alloys. In quenched pure aluminium, a void is formed at a small vacancy cluster which contains a single hydrogen atom. Moreover voids are nucleated at small solute atom clusters in quenched aluminium dilute alloys. Another is the formation of vacancy clusters in pure copper and silver which are quenched in ultra-high vacuum. Vacancy clusters are observed only in the specimen outgassed elaborately. These suggest that a vacancy interacts strongly with gas atoms in these metals. (4 refs.)

113896 Structure of small vacancy clusters in FCC solids and influence of the interatomic potentials. N.V.Doan (Section de Recherches de Metall. Phys., CENS, Gif-sur-Yvette, France).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.722-5

The structure of small vacancy clusters in copper and argon solids were investigated using the molecular-dynamics technique. It was pointed out that the clusters have a different behaviour in these solids. The role of the interatomic potentials is discussed. (1 ref.)

113897 Vacancy clustering in dilute aluminum alloys. N.Kamigaki, E.Hashimoto, Y.Deguchi, T.Kino (Dept. of Phys., Ehime Univ., Matsuyama, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.730-2

Pure Al and dilute Al-Mg alloys were quenched from 600°C at various quenching rates $5 \times 10^3 \sim 5 \times 10^4^\circ\text{C/s}$ and aged at $3^\circ\text{C} \sim 80^\circ\text{C}$, and observed with an electron microscope. The density of faulted loops largely depends on the quenching rate in pure Al and this tendency decreases with the increase of Mg content. Furthermore, the density of loops depends on the aging temperature and it becomes higher with the increase of Mg content at the same aging temperature. On the other hand, vacancy clustering process is simulated by a clustering model taking into account a role of Mg atoms on the process. From these results, it is concluded that the vacancy clusters and complexes composed of around ten vacancies are the origin of faulted loops, and that the binding energy between a mono-vacancy and a Mg atom is less than 0.08 eV. (10 refs.)

113898 The study of vacancy clustering in deformed metals by positron annihilation. S.Tanigawa, I.Shinta, H.Iriyama (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.736-9

High counting rate measurements of positron lifetimes were applied to the isochronal annealing study of deformed metals. In iron and vanadium, mean lifetimes initially increased and then decreased and showed a shoulder at high temperatures. On the other hand, in nickel, tantalum and niobium, mean lifetimes initially decreased and made a hump at temperatures characteristic for metals. Application of three state trapping model clearly predicts that vacancies migrate below room temperature in iron and vanadium, at about 570K in nickel, at about 620K in niobium and 570K in tantalum. (6 refs.)

113899 Influence of vacancies and interstitials on the Bordoni peaks in copper and silver. C.Minier, J.Lauzier (Univ. Sci. et Medicale de Grenoble, Grenoble, France).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.749-52

The variation of the Bordoni peaks is studied during electron bombardments of copper and silver and their subsequent annealings. The temperature range of diffusion of selfinterstitials along different kinds of dislocations is inferred. (4 refs.)

113900 Softening and hardening induced by point defects and defect clusters in BCC metals. K.Kitajima, E.Kuramoto, H.Abe, Y.Aono (Res. Inst. for Appl. Mech., Kyushu Univ., Fukuoka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.762-5

Softening and hardening characteristics induced by point defects and defect clusters in BCC metals were compared among pure iron single crystals irradiated at a low temperature by 2.5 MeV and 28 MeV electrons and those doped with solute nitrogen, and also among Mo single crystals to which similar irradiations were given. It was concluded that the controlling factors were misfit strain and migration energy of point defects or stability under stress field of a dislocation in case of clusters. Explanations were presented on the mechanism due to these factors. (10 refs.)

113901 The temperature dependence of the displacement threshold energy in FCC and BCC metals. K.Urban, B.Saile (Inst. für Phys., Max-Planck-Inst. für Metallforschung, Stuttgart, Germany), N.Yoshida, W.Zag.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.783-8

Experimental results on the temperature dependence of the displacement threshold energy in Cu, Mo, and Nb are reported which were obtained by high-voltage electron microscopy. In Cu the minimum threshold energy decreases continuously from 17.5 eV at 70K to 10.5 eV at 550K. In Mo it decreases from 34.5 eV at 70K to 26.5 eV at 800K and in Nb from 28.5 eV at 50K to 25 eV at 300K. This pronounced temperature dependence is explained by the existence of Frenkel pair configurations which can be created at low energies but whose stability decreases from higher to lower temperatures. (19 refs.)

113902 Kinetic behavior of point defects in electron irradiated FeAl alloy. C.Kinoshita (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan), T.Mukai, S.Kitajima.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.857-60

The disordering process and the nucleation-growth process of dislocation loops in FeAl have been examined during irradiation in a HVEM. Experimental

results are successfully analyzed by a theory based on uncorrelated recombination of interstitials and structural vacancies as well as induced vacancies. (6 refs.)

113903 Interstitials and interstitial clusters in fast-neutron irradiated molybdenum by X-ray Huang scattering. H.Maeta (Div. of Phys., JAERI, Ibaraki, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.873-5. Measurements of X-ray Huang scattering and the change in the lattice parameter were made for molybdenum during an isochronal annealing program after fast neutron irradiation at 5K. Above 30K, interstitials form clusters and then grow up to large clusters. Between 100 and 200K, interstitial clusters take the form of a dislocation loop which then grow to large dislocation loops. The origin and final orientation of the interstitial loops is discussed. (8 refs.)

113904 Vacancy dipole loops observed in low temperature neutron irradiated pure gold and pure aluminum. Y.Shimomura (Dept. of Appl. Phys. & Chem., Hiroshima Univ., Hiroshima, Japan), E.Naya, H.Yoshida. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.884-6. Thin foils of pure gold and pure aluminum were quenched from high temperature. Without exposing the specimens to the temperatures at which vacancies can migrate by thermal motion, specimens were irradiated with fission neutrons at about 20K. After the specimens were annealed at room temperature, it was observed by electron microscopy. Long straight rod shaped defects were observed together with small dotted defects. In pure gold, rod shaped defects were along (110) directions and found to be narrow faulted dipoles. In pure aluminum they were perfect dipole and did not align to any low index direction. Possible mechanism for the formation of vacancy dipole loops are discussed. (no refs.)

113905 Microdefects and impurities in dislocation-free silicon crystals. T.Abe, H.Harada (Shin-Etsu Handotai Co., Gunma-ken, Japan), J.Chikawa. Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.1-17. Microdefects in striated (swirl defects) and non-striated distribution (D-defects) have been observed in float-zoned crystals doped with various impurities by X-ray topography following copper decoration. A new type of defect was found to be present in swirl-free and D-defect-free regions and to become invisible by doping gallium. This gallium effect led to the conclusion that they are microprecipitates produced from residual oxygen impurity in FZ crystals. Effects of various impurities on defect formation indicate that D-defects are of vacancy agglomerates. It was observed that swirl defects are formed when the temperature gradient near the interface is high, and that their formation is suppressed by doping nitrogen. Formation processes of microprecipitates, swirls, and D-defects are discussed on the basis of observation of their mutual interaction and the impurity effects. (26 refs.)

113906 The nature of point defects and their influence on diffusion processes in silicon at high temperatures. U.Gosele (Max-Planck-Inst. für Metallforschung, Stuttgart, Germany), T.Y.Tan. Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.45-59. Highlights recent progress in understanding the role of vacancies and self-interstitials in self- and impurity diffusion in silicon above about 700°C. How surface oxidation of silicon leads to a perturbation of the point-defect population is described. An analysis of the resulting oxidation-enhanced or -retarded diffusion of group III and group V dopants shows that under thermal equilibrium as well as under oxidation conditions both vacancies and self-interstitials are present. For sufficiently long times vacancies and self-interstitials attain dynamical equilibrium which involves their recombination and spontaneous thermal creation in the bulk of silicon crystals. The existence and the nature of a recombination barrier slowing down the recombination process are discussed in this context. Recent experimental and theoretical results on the diffusion of gold in silicon enable the authors to determine the self-interstitial component of silicon self-diffusion and to obtain an estimate of the respective vacancy contribution. The two components turn out to be of the same order of magnitude from 700°C up to the melting point. (72 refs.)

113907 Point defect thermodynamics of compound semiconductors and their alloys. F.A.Kroger (Dept. of Materials Sci., Univ. of Southern California, Los Angeles, CA, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.207-24. The physical properties of crystalline solids depend on the presence of point defects. The concentrations of these defects in turn depend on the conditions of preparation and the presence of dopants. Quantitative relations between these condition (partial pressures of components, concentrations of dopants, temperature) and the defect concentrations is arrived at on the basis of defect chemistry. Examples of pure and doped binary compounds, alloys of binary compounds, and ternary compounds, are given. Whereas binary compounds have one composition variable, the alloy systems and the ternary compounds have two. The role of phase diagrams in preparing systems of required composition and properties is stressed. (196 refs.)

- 113908 Surface modification by ion implantation—effects on fatigue.** K.V.Jata, E.A.Starke, Jr., *J. Met. (USA)*, vol.35, no.8, p.23-7 (Aug. 1983). Recent work by the authors on ion implanted single and polycrystalline metals and alloys has shown that ion implantation can have beneficial effects on the fatigue life of materials. For an exact determination of the influence of a particular implanted species, they have shown that it is necessary to characterize the defect structure, deformation modes, and surface residual stresses produced. These studies have shown that the fatigue crack initiation and lifetime could be extended by choosing an ion species which leads to more homogeneous deformation near the surface region. On the other hand, implantation into some alloy systems extends the fatigue life by forming second phases or producing compressive residual stresses. This paper will give an overview of the various effects that ion implantation can have on microstructure, deformation behavior, and fatigue crack initiation resistance. The base materials that have been examined include aluminum, copper, 4140 steel, and two titanium alloys. (20 refs.)
- 113909 The role of the state of dispersion of impurity on Z₁-centres in NaCl:Ca²⁺ crystals.** K.N.Reddy, M.L.Rao, V.Haribabu (Dept. of Phys., Osmania Univ., Hyderabad, India). *Mater. Res. Bull. (USA)*, vol.18, no.8, p.1021-5 (Aug. 1983). Thermoluminescence and optical absorption studies were carried out to study the bleaching kinetics of F-centre and the formation of Z₁-centres in X-irradiated calcium doped NaCl crystals, both in as-received crystals and after quenching them from 555°C. An additional TL peak was observed in this system after F-bleaching of X-irradiated samples, which is attributed to thermal annealing of Z₁-centres. The various models proposed for Z₁-centres were reviewed in the light of these results, and it was concluded that the Z₁-centres are associated with impurity-vacancy dipoles. (7 refs.)
- 113910 Color centers in K₂S₂O₆ and Rb₂S₂O₆ crystals.** A.G.Badalyan, A.Yu.Klimova, Z.B.Perekalina, V.A.Khrantsov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.348-9 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.610-12 (Feb. 1983). [received: Sept. 1983] The authors study the color centers occurring in X-irradiated K₂S₂O₆ and Rb₂S₂O₆ crystals using ESR as well as optical spectroscopy. The EPR spectra were recorded on radiospectrometers (ranges of 3 cm and 8 mm). The optical absorption spectra were taken with a two-beam automatic ESR-3 Hitachi spectrophotometer. (6 refs.)

61.70G Dislocations: theory

- 113911 Penetration depth of diffusion-induced dislocations.** N.Itoh, T.Nakau (Dept. of Electronics, Univ. of Osaka Prefecture, Osaka, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.7, p.1106-11 (July 1983). To estimate the penetration depth of diffusion-induced dislocations, the depth of the neutral plane of internal stress is obtained quantitatively in values relative to the junction depth of the usual diffusion profiles. The following two cases are considered: (1) the stress distribution is due mainly to the distribution of impurity atoms and (2) the stress is relieved by the generation of a majority of dislocations. The shallow penetration of (1/3-2/3) X_j observed so far is explained by case (1). Deep penetration beyond the junction is shown to be generally possible only in case (2) and at this time, the change of the depth of the neutral plane depths on the moment of the dislocation distribution. It is also explained that the force on a dislocation due to the diffusion-induced stress causes the climbing motion. (28 refs.)
- 113912 Dynamic analysis of dislocation generation due to sudden indentation.** L.M.Brock (Dept. of Engng. Mech., Univ. of Kentucky, Lexington, KY, USA). *Int. J. Eng. Sci. (GB)*, vol.21, no.12, p.1437-42 (1983). The dynamic analysis of an edge dislocation generated under the edge of a rigid smooth indenter applied suddenly to an elastic half-plane is presented. The physical requirement that the indenter edge cannot induce a corner yields an equation relating the dislocation, indenter and half-plane parameter. Study of the equation allows several general observations on the dislocation motion. In particular, a given dislocation moving at a given speed can move along either of two paths below a certain indentation level. (11 refs.)
- 113913 Structure of triple dislocation points forming in the course of dislocational reactions in HCP crystals.** G.V.Bushueva, E.M.Yakhshaatova (Dept. of Molecular Phys., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.21-7 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.20-5 (1983). The moment method is used to investigate the structure and stability of triple spatial dislocational points in HCP crystals. The moment method offers the possibility of more rigorous estimation of the conditions of occurrence of dislocation reactions than the Frank criterion. The 'moment' criterion allows the region of guaranteed occurrence of dislocational reactions to be determined, i.e. the region of mutual orientations of the dislocations for which the occurrence of reactions between them is favorable. (17 refs.)
- 113914 Obstacle-dragging movement of dislocations.** S.I.Zaltsev (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.222-5 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.394-9 (Feb. 1983). [received: Sept. 1983] A model is formulated for the movement of dislocations, taking into account the dragging of obstacles and based on the idea of obstacle diffusion across a dislocation as a result of the interaction with the latter. A kinetic equation is obtained for the time variation of the mean length of a dislocation segment, the dislocation velocity and the obstacle transport characteristics being defined in terms of this length. A transient-state model is used to explain qualitatively some phenomena, such as the nonlinear variation of the dislocation travel with the load action time and the 'delay time'. (9 refs.)
- 113915 Defects, dislocations and degradation of compound semiconductors.** W.D.Johnston, Jr. (Bell Labs., Murray Hill, NJ, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.453-60 Diode lasers and/or LEDs fabricated from the Ga_{1-x}Al_xAs/GaAs for In_{1-x}Ga_xAs₂P_{1-y} alloy system provide the basis for rapidly developing optical communications systems. These devices are operated at very high optical and electrical power densities, and the inevitable less-than-perfect efficiency results in intense local thermal and athermal lattice excitation. This in turn can lead to generation, motion and growth of extended defect structures including dislocation networks, precipitation of impurities, or phase separation. For the Al_{1-x}Ga_xAs material, a predominant degradation effect is the development of so-called (100) 'dark line defects' (DLDs). These have been shown to arise from recombination enhanced climb of threading dislocations giving rise to dipole loops of a primarily interstitial character. A less common form, the (100) DLD, is associated with slip and typically arises from the strain associated with mechanical damage or careless handling or device processing. The In_{1-x}Ga_xAs₂P_{1-y} device material affords less energy per recombination event by virtue of its smaller band-gaps, but is likely to have more lattice mismatch strain than Ga_{1-x}Al_xAs for typical compositions of device interest. Thus slip, (110) DLDs, and precipitates are the commonly observed features of In_{1-x}Ga_xAs₂P_{1-y} degradation. (28 refs.)

Part A*, vol.57A, no.3, p.175-81 (May 1983). TEM studies of natural WS₂ single crystals have been investigated. Dissociated dislocation ribbons, isolated contracted and extended nodes, star-like pattern, etc. are observed and discussed using bright field and dark field microscopy. (3 refs.)
- 113917 Weak-beam study of glide dislocations in HCP cobalt.** A.Korner, H.P.Karntaler (Inst. fur Festkorperphys., Univ. Wien, Wien, Austria). *Philos. Mag. A (GB)*, vol.48, no.3, p.469-77 (Sept. 1983). The weak-beam method of electron microscopy has been used to analyse the Shockley partial dislocation in a pure HCP metal. Single crystals of cobalt were grown oriented for basal slip and deformed in compression. The dissociation of the basal glide dislocations into partials is resolved; the arrangement of the magnetic domains does not influence the splitting width of the partials. From a careful analysis of the observed image peak separations, a room-

temperature stacking-fault energy $\gamma=27\pm4$ mJ m⁻² is deduced. The basal glide dislocations contain many jogs. Frequently the sequence of the partials is reversed at a jog, which leads to the conclusion that the dislocation is jogging over an odd number of lattice planes and has a stacking fault of the same intrinsic type I₂ on both sides of the jog. It should be pointed out that in the FCC structure this behaviour has not been observed, since the reversed sequence of the partials would lead to a glide dislocation containing an extrinsic fault. (21 refs.)

113918 Investigation of defect structure of metal-semiconductor interface in SMS by the method of high-voltage electron microscopy. B.I.Smirnov, G.Kestner, A.V.Ryabov, I.A.Smirnov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.305-7 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.541-6 (Feb. 1983). [received: Sept. 1983]

Using the method of high-voltage electron microscopy (accelerating voltage 1000 kV), the authors have investigated the defect structure of the metal-semiconductor interface in samarium monosulfide crystals. It is shown that, with the semiconductor-metal phase transition that occurs in thin surface layers of specimens during mechanical polishing a characteristic net of misfit dislocations is formed in the interphasal surface. (6 refs.)

113919 Vacancy and interstitial loops in irradiated copper. B.C.Larson, F.W.Young,Jr. (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.679-86

Significant advances have been made in diffuse scattering studies of irradiation induced dislocation loops in metals. Numerical calculational procedures have been developed that provide accurate diffuse scattering cross sections for vacancy and interstitial loops, and these cross sections have been used in conjunction with X-ray diffuse scattering studies of neutron and ion irradiated copper. Size distributions and concentrations have been obtained for both vacancy and interstitial loops and these results are compared with electron microscopy measurements. The size distributions obtained from diffuse scattering measurements show the vacancy loops to be smaller and more numerous than the interstitial loops, and indicate that equal numbers of vacancies and interstitials are in loops. The diffuse scattering and microscopy size distributions agree at the larger sizes, but the diffuse scattering method identifies more loops of the smaller sizes. (17 refs.)

113920 Agglomerates of interstitial-atoms and vacancies in e⁻-irradiated copper. P.Ehrhart, B.Schonfeld, K.Sonnenberg (Inst. fur Festkorperforschung, KFA Jülich, Jülich, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.687-90

Diffuse X-ray scattering from dislocation loops has been treated by new calculational methods that allow the discrimination between vacancy and interstitial type loops and also a quantitative determination of loop sizes and concentrations. Based on these calculations the interaction of vacancies with interstitial loops and the formation of vacancy agglomerates during annealing stage III in Cu has been investigated after electron irradiation at different temperatures. Independent of the behaviour of the interstitial loops, which grew or shrank dependent on their size and concentration at the end of stage II, vacancy agglomerates were observed after annealing stage III. A decrease of ρ_F was always observed along with the vacancy clustering. The vacancy agglomeration processes seem to be more sensitive to impurities than the interstitial loop growth. (6 refs.)

113921 Effect of impurity atoms on the formation of secondary defects in quenched aluminium. K.Watanabe (Tokyo Metropolitan Tech. Coll., Tokyo, Japan), Y.Morishita, H.Yamaguchi, S.Yoshida.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.726-9

The effect of impurity atoms on the formation of dislocation loops and voids is examined with an electron microscope. The result obtained is summarized as follows: (i) The formation of dislocation loops is promoted by small amount of substitutional impurity atoms and the order of the promotive effect is Ge>In>Si>Cu>Sb>Bi>Ni>Mg>Zn>Ag>Au>Sn. (ii) Helium atoms as well as hydrogen atoms promote the formation of voids and the effect of helium atoms is smaller than that of hydrogen atoms. These results are discussed briefly from the binding energy between a vacancy and a small vacancy cluster containing impurity atoms using the rate equations taking into account the diffusion motion of vacancies in a crystal. (7 refs.)

113922 HVEM in-situ observation of formation of helical dislocations in Ag-10 at.% Al. H.Saka, T.Kondo (Dept. of Metall., Nagoya Univ., Nagoya, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.770-2

Dissociated near-screw dislocations in Ag-10 at.% Al were irradiated with 1 MeV electrons at 473K in a HVEM and the transformation of the dissociated screws into helices as a result of the interaction of point defects introduced was observed in situ using the 'weak-beam' electron microscopy. Results of observations have been analyzed in terms of the 'loop-jog' model of climb of dissociated dislocations proposed by Cherns, Hirsch and Saka. (6 refs.)

113923 Analysis of defects in heavily-doped MBE-GaAs. C.B.Carter, D.M.Desimone, H.T.Griem, C.E.C.Wood (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.271-5
GaAs has been grown by molecular-beam epitaxy (MBE) with large concentrations (~10¹⁸ cm⁻²) of Sn, Si, Ge, and Mn as dopants. The heavily-doped n-type material has been found to contain regions of a very high dislocation density. An analysis of the less complex defect areas shows that the dislocations originate in the MBE-grown layer. These observations and others on more complex defect clusters are compared with recent studies of defects in material grown by liquid phase epitaxy (LPE). The more heavily doped p-type material contains discs of Mn-rich material at the surface of the MBE-grown epilayer. Both the structure and composition of these regions have been examined. (8 refs.)

113924 Influence of temperature on the mobility of dislocations in iron and martensite during internal friction measurements. V.I.Sarrak, S.O.Suvorova (Inst. of Metall. & Phys. of Metals, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.379-82 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

When iron was annealed to temperatures below 400°C there was no motion of dislocations pinned by impurity atoms when the stresses were of the kind used in the internal friction measurements. An increase in the dislocation mobility above 400°C was due to the breakup of the atmospheres of impurity atoms around dislocations. The motion of dislocations (pinned by impurity atoms in martensite) under the influence of stresses used to measure the internal friction was observed even at room temperature. At temperatures near 200°C the mobility of dislocations pinned by impurity atoms was maximal. (9 refs.) *A.T.*

113925 Dislocation structure of large-domain ordered Ni₃V alloy. G.I.Nosova, N.A.Polyakova (Inst. of Metall. & Phys. of Metals, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.383-9 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A dislocation structure with domains of about 5000 nm size was studied in the ordered Ni₃V alloy. Even at the earliest stages of the deformation the shear involved multiple glide of single dislocations. In some domains they split forming extending stacking faults. Accumulation of such defects in nearby parallel planes during the later stages of deformation of the alloy produced twin layers. The reasons responsible for the glide of single dislocations, generating antiphase boundaries, and formation of extended stacking faults in domains in specific orientation were considered. The nature of the barriers appearing in alloys because of the interaction with strongly split dislocations was determined. (11 refs.) *A.T.*

113926 Dislocation structure and amplitude-dependent internal friction of LiF crystals. B.I.Smirnov, V.A.Chelnokov, N.L.Kuz'min (M.I. Kalinin Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.293-5 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.519-24 (Feb. 1983). [received: Sept. 1983]

A study was made of the changes in the dislocation structure during measurements of the amplitude-dependent internal friction of LiF crystals. The parameters of the dislocation structure were compared with the behavior of the amplitude dependence of the decrement. For vibration amplitudes corresponding to an amplitude dependence of the decrement, a multiplication of dislocations in the surface layers of the crystals occurs. The amplitude dependence of the decrement, measured for a progressive increase in vibration amplitude, corresponds to motion of a variable number of dislocations. For decreasing vibration amplitudes, the amplitude dependence characterizes the motion of a constant number of dislocations, while the parameters of this motion are independent of the number of induced dislocations. 113927 Morphology and polarity of twinned crystals in II-VI compounds. H.Iwanaga, T.Yoshiie, T.Yamaguchi, N.Shibata (Faculty of Liberal Arts, Nagasaki Univ., Nagasaki, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1098-100 (July 1983). ZnO twinned crystals with the composition plane (1011) or (1122) were grown by oxidizing ZnSe in the vapor phase. The twinned crystals consisted of two plate crystals grown in the $+c$ and $-c$ directions. CdS and CdSe twinned crystals with the composition plane (1011) were also grown by the sublimation method. Both of these consisted of branch crystals growing around an original (central) c -needle which grew in the $-c$ direction. These branch crystals made an angle of 56° with the original c -needle. They grew in the $+c$ direction in CdS and in the $-c$ direction in CdSe. (9 refs.)

113928 Twin growth of sucrose crystals. G.Mantovani, G.Vaccari, C.A.Accorsi (Scuola 'Serafino Cevasco', Univ. di Ferrara, Ferrara, Italy), D.Aquilano, M.rubbo.

J. Cryst. Growth (Netherlands), vol.62, no.3, p.595-602 (Aug. 1983). A crystallographic and kinetic approach is given to understand twinning of sucrose crystals. The twin law is redefined and original composition planes for twinning (OCP) are found consistent with experiments. The elongation parameter II is defined as a function of supersaturation and growth time. The calculated and measured II values compare favourably both in pure solution growth and in the presence of low concentrations of raffinose. Experiments stress that the polar character of sucrose is determining both the crystallographic properties and kinetic behaviour of twins. (15 refs.)

113929 Simple structural unit model for core-dependent properties of symmetrical tilt boundaries. R.W.Balluffi (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA), A.Brokman.

Ser. Metall. (USA), vol.17, no.8, p.1027-30 (Aug. 1983). It is demonstrated that the recently determined structural unit model for the core structure allows one to estimate any physical property, p , for any boundary in a series of symmetrical tilt boundaries possessing a range of tilt angles if values of p for a few particular boundaries in the series are known. More specifically, it is shown that p for all boundaries with misorientations between those of two so-called 'favored boundaries' can be estimated from a knowledge of the equal numbers of the structural units comprising the two favored boundaries. Applications of the results to measurements of boundary diffusivities and boundary energies are indicated briefly. (11 refs.)

113930 The interface structure of grain boundaries in polysilicon. S.M.Johnson (Solarex Corp., Rockville, MD, USA), K.C.Yoo, R.G.Rosemeier, P.Soltani, H.C.Lin.

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.357-61. Normal grain growth in polysilicon material proceeds by a twinning mechanism such that the individual grain orientations are related by single or multiple twinning steps. The twinning relationship between adjacent grains can result in the alignment of their boundary interfaces along certain planar segments which have a very low electrical activity. The varying degree of electrical activity of these boundaries, and boundary positions, is attributed to the smaller dislocation portion of the larger change in orientation across the grains. (11 refs.)

113931 The structure of a near coincidence $\Sigma=5$, [001] twist boundary in silicon. M.Vaudin, D.Ast (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.369-73. The dislocation structure of a near coincidence $\Sigma=5$ (001) twist boundary in silicon was studied using transmission electron microscopy. Secondary dislocations, with localized cores were observed in the boundary accommodating a small deviation ($<0.5^\circ$) from perfect coincidence. The O-lattice theory for general low angle boundaries was extended to calculate the expected dislocation content of near coincidence boundaries. Comparison between predictions and observations was used to deduce information on the primary dislocation structure of the boundary. (11 refs.)

61.70P Stacking faults, stacking fault tetrahedra and other planar or extended defects

113932 Crystallographic shear in the Nb₂O₅-Ta₂O₅-WO₃ quaternary system at 1623K. P.J.England, R.J.D.Tilley (School of Materials Sci., Univ. of Bradford, Bradford, England).

Chem. Scr. (Sweden), vol.22, no.3, p.108-16 (1983). The microstructures occurring in the quaternary system Nb₂O₅-Ta₂O₅-WO₃ at 1623K and in the composition range between WO₃ and (Nb, Ta)₂O_{2.86} have been determined. Samples were prepared by heating appropriate mixtures of the parent oxides in sealed Pt ampoules for 5 days, and structural information was obtained mainly by way of high resolution electron microscopy. A CS phase field was found between the composition limits of (Nb, W)O_{2.965} and (Nb, W)O_{2.875} on the Nb rich side of the phase interval and

between (Ta, W)O_{2.96} and (Ta, W)O_{2.943} on the Ta rich side of the phase interval. The CS microstructures consisted of intergrowths of {001}, {104} and {103} CS and varied in a consistent manner across the CS phase field. No ordered 'swinging CS' regions were found. (12 refs.)

113933 High resolution electron microscopy study of phosphate tungsten bronzes KP₂O₈(WO₃)_{2m}. II. Crystallographic shear planes observation. M.Hervieu, B.Raveau (Lab. de Cristallographie, Univ. de Caen, Caen, France). *Chem. Scr. (Sweden)*, vol.22, no.3, p.123-8 (1983). For pt.I see *ibid.*, vol.22, no.3, p.117-22 (1983). The high integral *m* compositions of the phosphate tungsten bronzes were studied by means of high resolution transmission electron microscopy. Non-stoichiometric defects by intergrowth or by P₂O₅ rows interruption have been previously reported in the first part of the study. Besides these specific defects, phosphate tungsten bronzes exhibit another type of nonstoichiometry related to the formation of crystallographic shear planes in the ReO₃-type slabs. Two types of CS planes {102} and mixed {103}/{001} CSP have been observed. Various arrangements of these defects are visualized: located defects as well as coherent intergrowths with the P₂O₇ planes. The CS structures were also seen to form during the observation in the electron microscope. The type of CS defects which occurred in the phosphate tungsten bronzes seems to be related with the width of the ReO₃-type slabs. (24 refs.)

113934 Localized formation of stacking fault tetrahedra by electron irradiation in FCC metals. M.Suehiro (Dept. of Material Phys., Osaka Univ., Osaka, Japan), N.Yoshida, M.Kiritani. *Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982)*, p.795-8
The distributions of stacking fault tetrahedra formed in copper, nickel and gold by electron irradiation in a high voltage electron microscope have been observed with stereo-electron-microscopy. Their distributions have the localized regions near the electron incident surface and/or near the bottom surface. These distributions are attributed to the two distinct damage processes which directly lead to local enrichment of vacancies. One is the replacement sequence collision damage and the other is the sputtering of atoms. Both processes are found to change remarkably with a slight change in the electron diffraction condition, and the oscillation of the current density of electrons at the atom row is proved to exist along the depth distance through the crystal. 61.70R Crystal impurities: general
(see also 71.55 Impurity and defect levels; 81.10 Purification techniques)

113935 On the precrystallization phase formation. Yu.M.Gerasimov, G.I.Distler, V.P.Makarov, A.Sh.Shalpikov (Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *Naturwissenschaften (Germany)*, vol.70, no.8, p.412 (Aug. 1983).
By means of the decoration method at an electronmicroscopic scale it was previously established that impurities in crystals are distributed unequally, forming micro- and macroassemblies. Based on the example of KCl crystals doped with 0.5 mass-% SrCl₂, the authors studied surface crystallization reactions of this impurity stimulated by thermal treatment at 350-550°C. On thermal treatment at 350°C for 20 min SrCl₂ impurity assemblies on cleavage surface begin to dissociate. On thermal treatment at 450°C for 20 min isolated anisometric impurity formations appear, oriented mainly along (110)_{KCl}. (5 refs.)

113936 Transition metal impurities in silicon. E.R.Weber (II. Phys. Inst., Univ. of Koln, Koln, Germany), N.Wiffl. *Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983)*, p.19-32
The properties of transition metals in silicon are reviewed, emphasizing those observations which allow conclusions to be drawn with respect to microscopic defect models. 3d metals diffuse interstitially into silicon and stay predominantly in these sites at high temperatures. 3d elements lighter than Co can be quenched into these interstitial sites, giving rise to well-established energy levels. First theoretic calculations for these ions yield promising results. Co, Ni and Cu vanish out of the interstitial solution during quenching; an appreciable fraction of Cu may form pairs. The understanding of 4d and 5d metals in silicon is much less advanced at present, even for the technologically important elements Au and Pt. Some observations indicate that for Au and Pt pair formation might as well be important. (55 refs.)

113937 Ultraviolet (UV) photochemical doping of silicon. K.G.Ibbs, M.L.Lloyd, R.D.Chad (General Electric Co. plc, Hirst Res. Centre, Wembley, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.361-4 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Describes a method of producing p-n junctions in silicon using an ArF laser to dissociate triethyl boron. Junction depths of 0-0.8 µm and peak electrically active dopant concentrations of 8×10¹⁸-2×10²⁰ have been measured. (3 refs.)

113938 Doping of indium phosphide with germanium. L.M.Pavlova, V.A.Antonov, N.V.Vanyukova, A.G.Karamov, L.I.Perederri, V.V.Selin (Moscow Inst. of Electronic Technol., Moscow, USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1229-32 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1444-7 (Sept. 1982). [received: Sept. 1983]
Using microstructural analysis and by measuring the microhardness the authors have determined the limits of the solubility of germanium in indium phosphide at different temperatures. The maximum solubility at 900°C is ~7×10¹⁹ at/cm³. Using the Czochralski method and liquid hermetic sealing of the melt at an inert-gas pressure of 490×10⁴ Pa, single crystals of indium phosphide doped with germanium have been grown. The range of experimental values of the effective distribution coefficient of germanium in indium phosphide has been obtained. The authors have measured the electrical parameters of single crystals of indium phosphide for different degrees of germanium doping. Curves of the Hall density and electron mobility as a function of the germanium density have been drawn. By comparing these curves with the limit saturation at a given temperature the authors have been able to draw conclusions on the mechanism by which germanium enters into the indium phosphide lattice. By analyzing the theoretical and experimental curves of the Hall mobility of the electrons against their density they have shown that in single crystals of indium phosphide doped with germanium scattering by charged centers predominates. (9 refs.)

113939 Autodoping phenomena in epitaxial silicon. G.K.Ackermann (Tech. Fachhochschule, Berlin, Germany), E.Ebert. *J. Electrochem. Soc. (USA)*, vol.130, no.9, p.1910-15 (Sept. 1983).
Autodoping experiments were performed using a radiation-heated Applied Materials Corporation (AMC) 7600 epitaxial reactor, (100) n-doped silicon wafers, arsenic-doped buried layers (subcollector) of total implanted or diffused dose of 7×10¹⁵-3×10¹⁶ cm⁻², and buried layer areas between 10 and 100% wafer area. Intentionally undoped epitaxial layers of 1.4 µm thickness were grown. The lateral autodoping was found to be very uniform with no distinct flow pattern-induced spatial distribution. Autodoping follows a square root law with respect to buried layer area. Autodoping shows a linear relationship with respect to buried layer doping. An analysis of the buried layer doping profile identifies the out-diffusion source with electrically inactive arsenic, about 50% of total implanted or diffused dopant. Less than 1% of the out-diffusing arsenic is incorporated into the wafer surface and growing epitaxial layer. (18 refs.)

113940 Metallurgical surfaces produced by ion implantation. D.I.Potter, M.Ahmed, S.Lamond. *J. Met. (USA)*, vol.35, no.8, p.17-22 (Aug. 1983).
Ion implantation, the process of embedding ions accelerated through high voltages, is described as a metallurgical tool for altering surface microstructure and properties. Examples of applications to improve resistance to wear, oxidation, and corrosion are provided. The possibilities for producing surface 'superalloys' is explored using Al³⁺ ion implantation into nickel as a prototype alloy system. The micromechanisms which operate and determine implanted surface chemistry are presented, and a predictive capability is demonstrated. Factors determining the phases that are stable in implanted alloys are outlined and demonstrated using P³⁺ and Al³⁺ ion implantation of nickel. Future directions using ion implantation for metallurgical purposes are discussed. (33 refs.)

113941 Role of channeling in the implantation of low-energy ions. N.P.Stepina, G.A.Kachurin (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.278-80 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.449-52 (March 1983). [received: Sept. 1983]
An investigation was made of the impurity profile of silicon doped by implantation of low-energy boron ions. The dependences on the ion energy, ion dose, target orientation, and implantation temperature were determined. The measurements were carried out by electrophysical methods after activation of the implanted impurity by annealing and also by the method of mass spectrometry of secondary ions. It was found that the observed deep penetration of boron was associated with channeling. The proportion of the channeled ions was fairly high up to a dose of 10¹⁵ cm⁻² even at a temperature of 20°C, indicating a low degree of disordering of the lattice by the low-energy boron ions. It was concluded that utilization of the channeling of low-energy ions is a promising method of doping of layers of very precise thickness and estimates were obtained of the channeling parameters of impurity ions of different masses in the energy range 1-10 keV. (8 refs.)

113942 Transient annealing of ion-implanted silicon using a scanning IR line source. Y.S.Liu, H.E.Cline, G.E.Possin, H.G.Parks, W.Katz (General Electric Res. & Dev. Center, Schenectady, NY, USA). *Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983)*, p.425-30
Recent interest in finding an efficient method for transient annealing of ion-implanted silicon has led to studies of various rapid annealing schemes such as graphite heaters and high intensity incoherent light sources as alternative methods to laser annealing. In this paper the authors describe a recent study of transient annealing of ion-implanted silicon using a scanning IR line source created by a single tungsten filament enclosed in a quartz envelope. Various dopants (B⁺, P⁺ and As⁺) with fluences of 10¹⁴ to 10¹⁶ ions/cm² were implanted and annealed under both transient and steady-state thermal conditions. Dopant depth distributions were analyzed using the SIMS technique. Sheet resistance measurements indicated that almost 100% activations of the implanted dopants were achieved. Sensitivities of dopant activation to transient annealing conditions were studied as a function of dopant concentrations, and high-dose As- and B-implanted samples were found to be sensitive to

transient thermal cycle, particularly to the peak temperature. Recrystallization was studied with Rutherford backscattering spectroscopy using 2 MeV He⁺ ions. (5 refs.)

113943 Measurements of ion-implantation damage in GaP. D.R. Myers, P.S. Percy, P.L. Gourley (Sandia Nat. Labs., Albuquerque, NM, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.505-9. The authors have applied stress measurements using the cantilever beam technique and Raman spectroscopy to characterize the dose dependence of damage production for He⁺, C⁺, or Ar⁺ implants into GaP. Stress increases monotonically with dose until a species-dependent critical dose is reached. Above that dose, the material yields at an integrated lateral stress of $\sim 2 \times 10^5$ dynes/cm², corresponding to an expansion of $\sim 1\%$ in the implanted volume. The dose dependence of stress scales well with the volume density of ion energy deposited into atomic collisions. Raman measurements indicate that the material is still crystalline when the yield stress is reached. (10 refs.)

113944 Damage and in situ annealing during ion implantation. D.K. Sadana, J. Washburn (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA), P.F. Byrne, N.W. Cheung. Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.511-16. Formation of amorphous (α) layers in Si during ion implantation in the energy range 100 KeV-11 MeV and temperature range liquid nitrogen (LN)-100°C has been investigated. Cross-sectional transmission electron microscopy (XTEM) shows that buried amorphous layers can be created for both room temperature (RT) and LN temperature implants, with a wider 100 percent amorphous region for the LN cooled case. The relative narrowing of the α layer during RT implantation is attributed to in situ annealing. Implantation to the same fluence at temperatures above 100°C does not produce α layers. To further investigate in situ annealing effects, specimens already containing buried α layers were further irradiated with ion beams in the temperature range RT-400°C. It was found that isolated small α zones (≤ 50 Å diameter) embedded in the crystalline matrix near the two a/c interfaces dissolved into the crystal but the thickness of the 100 percent α layer was not appreciably affected by further implantation at 200°C. A model for in situ annealing during implantation is presented. (6 refs.)

113945 A comparison of ellipsometer and RBS analysis of implant damage in silicon. W.M. Paulson, S.R. Wilson (Semiconductor Res. & Dev. Lab., Motorola Inc., Phoenix, AZ, USA), C.W. White, B.R. Appleton. Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.523-7. The purpose of this study is to analyze ion implant damage profile using RBS and ellipsometry. Silicon wafers were implanted with ⁷⁵As at 100, 200 or 300 keV; doses were chosen to generate constant peak impurity concentrations at each energy. The samples were then analyzed using RBS to obtain damage-depth profiles and ellipsometry to obtain Δ , Ψ parameters. At light doses decreasing Δ values correspond to increased scattering yield; at higher doses Ψ increases rapidly as the scattering yield approaches the random value. The higher energy implants shift the Δ - Ψ curves to larger Ψ values. Multilayer structures, that include lightly damaged silicon on either side of the project range as well as more damaged near the projected range, are required to model the ellipsometer parameters. (16 refs.)

113946 The study of damage profile of ion implanted layer on Si by spectroscopic ellipsometry. J. Luo, P.J. Mc Marr, K. Vedam (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.529-33. The authors have determined the dielectric function of silicon samples which were implanted with 100-150 keV P, As, Si ions to doses of 2×10^{14} - 1×10^{16} cm⁻², by a rotating analyser Automated ellipsometer in the spectral range 1.77-4.59 eV. These data have been analyzed using a simplified three layer model. (5 refs.)

113947 Si-on-sapphire and Si implanted with Zr ions: lattice location, solid phase epitaxial regrowth and electrical properties. I. Golecki (Rockwell Internat. Corp., Anaheim, CA, USA), I. Suni. Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.541-5. Zr ions have been implanted at 300 keV ($R_p=1400$ Å) and doses of 3×10^{12} - 3×10^{15} Zr/cm² into Si-implanted, amorphous Si layers on (100) bulk Si and Si-on-sapphire. Rutherford backscattering and channeling spectroscopy was used to study the Zr distribution and lattice location during solid-phase regrowth of the Si layers. The regrowth at 500-550°C stops at 3.4×10^{20} Zr/cm³, and Zr exhibits interface trapping and surface segregation effects. In this temperature range, Zr is essentially non-substitutional, and inactive electrically. (10 refs.)

113948 Correlation among secondary ion mass spectrometry, cross-section transmission electron microscopy, and Rutherford backscattering analyses for defect density and depth distribution determination. R.G. Wilson (Hughes Res. Labs., Malibu, CA, USA), D.K. Sadana, T.W. Sigmon, C.A. Evans, Jr., *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.549-51 (15 Sept. 1983). Correlation is found between the relative densities and depth distributions of defect clusters/disorder/damage measured by cross-section transmission electron microscopy and Rutherford backscattering and silver atom depth distributions measured by secondary ion mass spectrometry for (100) and (111) silicon implanted with silver ions and annealed at 550°C. (4 refs.)

113949 Direct hydrogen profile determination in TiO₂ after electrochemical treatment. P. Clechet, C. Martelet, R. Olier (Ecole Centrale de Lyon, Ecully, France), J.P. Thomas, M. Fallavier, *J. Electrochem. Soc. (USA)*, vol.130, no.8, p.1795-6 (Aug. 1983). Electrochemical treatments of titanium oxide are well known as leading to important changes in physical (color, IR absorption), electrical (capacitance, conductivity) and photoelectrochemical properties either for single crystal material or RF reactively sputtered or thermally grown thin layers. Here the authors report observations on highly doped ($\sim 10^{19}$ cm⁻³) 200 nm thick layers obtained by anodic oxidation of bulk electropolished titanium, at 80 V in 1 M sulfuric acid. Nuclear analysis brings out direct evidence of the existence of at least two forms of incorporated hydrogen within TiO₂ layers as is often proposed in the literature. Incorporation mechanism seems to be intricate and the hydrogen profile in the authors samples cannot be explained by a simple diffusion law. Probably some hydrogen species are trapped on defects resulting from crystallization during film growth (11). (11 refs.)

113950 Chlorine redistribution in HCl oxides due to high temperature annealing. B.C. Beard (Center for Surface & Coatings Res., Lehigh Univ., Bethlehem, PA, USA), S. Titcomb, S.R. Butler, *J. Electrochem. Soc. (USA)*, vol.130, no.9, p.1959-61 (Sept. 1983). The incorporation of chlorine in the growing SiO₂ film during O₃/HCl oxidation of silicon has been studied. Under certain oxidation conditions a Cl-rich phase develops at the interface of the SiO₂ film and the Si substrate. The redistribution of the Cl from the SiO₂/Si interface region in response to high temperature annealing is discussed. Secondary ion mass spectrometry (SIMS) analysis was performed on a number of Cl containing specimens. The superior depth resolution of SIMS (< 18 nm) over RBS (35 nm) allowed for more detailed depth profiles of Cl. (5 refs.)

113951 Investigating the distribution of impurity iron atoms in the compounds Ni₃Al, NiAl and Ni₂Al₃. I.A. Zelenkov, S.N. Pastushenko, *Russ. Metall. (GB)*, no.3, p.165-6 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.189-90 (1982).

Iron-57 impurity atoms in nickel aluminides can be located in both the aluminum and the nickel sublattices. The iron atoms are mainly in the aluminum sublattice in Ni₃Al, and in the nickel in NiAl and Ni₂Al₃. One reason for the growth of the ⁵⁷Fe isomer shift in nickel aluminides is due to the increase in the number of aluminum atoms in the local environment of the Mossbauer atom. Another is the filling of the d-band of the alloys with increasing aluminum content in the compounds investigated. (5 refs.)

- 113952 Amounts and character of distribution of impurities in zone-melted single-crystal lanthanum hexaboride.** Yu.B.Paderno, V.I.Lazorenko, N.I.Buryak, A.V.Kovalev, A.A.Matvienko, A.P.Galasun (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.50-3 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.60-3 (Jan. 1983). [received: Aug. 1983]
Lanthanum hexaboride single crystals were grown and refined by the levitation zone melting technique with induction heating. The amounts and character of distribution of impurities in the starting and zone-melted materials were determined by quantitative spectral analysis. It is shown that zone melting effectively purifies a starting lanthanum hexaboride powder from many contaminants. The effectiveness of removal of some low-melting-point and volatile elements is increased by their evaporation and escape in the gaseous form from the molten zone. Estimated values of effective coefficients of distribution of many impurities are given. (7 refs.)
- 113953 Character of impurity distribution in comminuted β -boron crystals.** T.Sh.Badzagua, M.V.Vlasova, D.L.Gabuniya, N.G.Kakazei (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.54-6 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.60-3 (Jan. 1983). [received: Aug. 1983]
With the aid of EPR data, the character of distribution of impurities in fine β -boron crystals was studied as a function of crystal particle size. Specimens for investigation were prepared by melting, using graphite and boron nitride crucibles, a boron powder of $\sim 98\%$ purity was produced in a vacuum corresponding to 10^{-1} - 10^{-2} Pa. The specimens were comminuted by the application of sharp shock loads and by abrasion. Powders produced by both methods were carefully purified from magnetic inclusions. The particles were divided into 50- to 500- μ m fractions by standard sieve analysis methods and into finer fractions by liquid sedimentation. The mean particle size (less than 50 μ m) was determined by microscopical analysis. EPR spectra were measured in a 3-cm range at room temperature. (9 refs.)
- 113954 Correlation of oxygen and recombination centers on a microscale in as-grown Czochralski silicon crystals.** K.Nauka, H.C.Gatos, J.Lagowski (MIT, Cambridge, MA, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.177-80
Quantitative microprofiles of the interstitial oxygen concentration and of the excess carrier lifetime, with a spatial resolution of about 20 μ m, were obtained in as-grown dislocation-free CZ-Si crystals employing a double laser absorption technique. It was found that maxima (minima) in oxygen concentration along the crystal growth direction coincide with minima (maxima) of the lifetime. It was further found that the relation between changes in oxygen concentration and in lifetime varies in the radial direction indicating that 'as-grown' oxygen precipitates are involved in lifetime limiting processes. 61.70Y Interaction between different crystal structure defects

- 113955 Interaction of hydrogen with nonmetallic inclusions of the different shapes in ferrite-pearlite steels.** V.L.Mirochnik, A.P.Okenko, V.I.Sarrak, G.A.Filippov (Inst. of Metall. & Phys. of Metals, Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.308-14 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The low permeability to hydrogen and the rate of evolution of hydrogen from ferrite-pearlite steel with elongated sulphide nonmetallic inclusions and its ability to absorb hydrogen were found to be due to the interaction of hydrogen with two types of defect: collectors and traps. Globularization of the inclusions increased the permeability to hydrogen and the rate of evolution of hydrogen, but it reduced the ability of steel to absorb hydrogen. The traps in the hydrogenated ferrite-pearlite steel in the absence of load were regions of bulk elongation in the metal matrix in the vicinity of the inclusions, which were formed as a result of the pressure of molecular hydrogen in the collectors located at the sulphide-matrix interfaces. (13 refs.) A.T.

- 113956 Simulation of the interaction of a vacancy with special tilt boundaries in a body-centred cubic lattice.** V.V.Pokropivnyi, V.V.Yagodkin (Inst. of Problems in Materials Sci., Acad. of Sci., Kiev, Ukrainian SSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.392-6 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A detailed numerical study is made of the interaction between vacancies and various special tilt boundaries in body-centred chromium as a function of the position of a vacancy on a boundary. The results indicated a strong dependence of the energy formation of a vacancy on the point at which it is located on a boundary and this can be explained by local inhomogeneities of the boundary structure. (15 refs.) A.T.
- 113957 Silicon-oxygen complexes containing three oxygen atoms as the dominant thermal donor species in heat-treated oxygen-containing silicon.** G.S.Oehrlein (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.5453-5 (Sept. 1983).
A kinetic study of thermal donor formation in 450°C heat-treated modern silicon crystals has been performed and it is concluded that SiO_3 complexes are the dominant thermal donor species (for heat-treatment times of up to about 100 h), rather than SiO_4 complexes. Clusters containing a number of oxygen atoms other than three or four seem to be also electrically active. (10 refs.)
- 113958 Modification of defects during irradiation of Si with high electron doses.** A.V.Dvurechenskii, B.P.Kashnikov, V.I.Panov (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.344-5 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.546-8 (March 1983). [received: Sept. 1983]
Provides a quantitative description of the behavior of vacancy defects on the assumption that V_2P (H) complexes are formed in silicon containing oxygen (OX-Si) and that oxygen provides effective vacancy annihilation centers. The authors consider a defect formation model which allows for reactions of two types: (1) formation of vacancy complexes with oxygen (O) and phosphorus (P) and (2) annihilation at vacancy complexes. The reactions which represent the loss of interstices to impurity atoms (C) followed by annihilation are also allowed for. This model can be described by a system of nonlinear first-order differential equations. (6 refs.)
- 113959 Mossbauer study of defect trapping at ^{57}Co in cold worked aluminium.** K.Sassa, W.Petry, G.Vogl (Freie Univ. Berlin, Berlin, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.213-15
Point defects induced by cold work of Al at various temperatures between 4.2K and 80K were trapped at $^{57}\text{Co}/^{57}\text{Fe}$ atoms and studied by Mossbauer spectroscopy. No free migration of interstitials was observed, whereas enhanced and free diffusion of vacancies respectively, was found at 100K and 200K. (12 refs.)
- 113960 PAC study of defect trapping at ^{111}In in cold worked aluminium.** H.G.Muller (Hahn-Meitner-Inst. für Kernforschung, Berlin, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.216-19
The PAC technique was applied to study the interaction of lattice defects with indium impurities in cold worked Al. Several In doped Al specimens were extended by different amounts of strain at 77K. No trapping of interstitials is observed, whereas after annealing between 110K and 210K an increasing fraction of the In impurities traps a lattice defect of vacancy type. The symmetry axis of the resulting In-vacancy-complex points along $\langle 111 \rangle$ directions. It is concluded that the In atoms trap divacancies, which at least partly migrate along dislocation lines. (15 refs.)
- 113961 A new doping technique for the PAC probes ^{100}Pd and ^{111}In and its application to the study of point defects in BCC metals.** H.Metzner, R.Sielemann, S.Klaumunzer, R.Butt, W.Semmler (Freie Univ. Berlin, Berlin, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.224-7
The authors show that heavy ion induced nuclear reactions are particularly well suited to dope highly impurity-sensitive materials with radioactive nuclear probes. The application of various probes (^{111}In , ^{100}Pd , ^{99}Rh) allows comparative PAC studies which take advantage of the different trapping behaviour of the probes. Thus detailed information about the properties of intrinsic point defects in niobium and first results on defect trapping at ^{100}Pd atoms in molybdenum were obtained. (7 refs.)
- 113962 Interstitial trapping by zinc atoms in electron-irradiated silver.** F.Maury (CNRS, Univ. Paris XI, Orsay, France), A.Lucasson, P.Vajda, M.Halbwachs, P.Lucasson. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.392-5
The trapping radius of self-interstitials by zinc atoms in a silver matrix is determined by the damage rate method. It is found $r_t = (0.6 \pm 0.25)r_v$, where r_v is the capture radius of a self-interstitial by a vacancy, if one assumes that the resistivity of the complex impurity+single interstitial is not smaller than the resistivity of the self-interstitial. The isochronal recovery spectra of the specimens (two dilute alloys containing respectively 200 and 1100 at.ppm of zinc) have been measured together with that of pure silver from 12 to 290K. An interpretation is proposed for the major recovery peaks. (7 refs.)
- 113963 Trapping of interstitials at ^{100}Pd , ^{111}In , and ^{181}Hf -impurities in irradiated cubic metals.** R.Sielemann, H.G.Muller, W.Semmler, R.Butt, H.Metzner (Hahn-Meitner-Inst. für Kernforschung, Berlin, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.403-6
The authors have used three different PAC probes (^{100}Pd , ^{111}In , ^{181}Hf) to study the behaviour of self-interstitials produced by low temperature electron or heavy ion irradiation in Al, Nb, and Mo. Their results demonstrate that selective trapping of certain types of defects occurs at the different impurities. General trends for the trapping behaviour are shown up and results on symmetries of the impurity-interstitial-complexes as well as on their annealing behaviour are reported. The electric field gradients generated by these complexes are remarkably large in the b.c.c. metals as compared with f.c.c. metals. (10 refs.)

113964 Dose dependence of interstitial trapping at ^{111}In impurities in e^- -irradiated aluminum. R. Butt, W. Semmler, H.G. Muller (Freie Univ. Berlin, Berlin, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.407-9

The perturbed angular correlation method (PAC) was applied to the investigation of defect trapping during electron irradiation above Stage I_g. The observed trapped defect can be attributed to a simple interstitial configuration. The dose dependence of the trapping behavior of the In-impurity atoms shows a saturation of the fraction of the trapped interstitial configuration at about 20%. There is no additional PAC component observed, which could account for the continuous increase of the residual resistivity. This requires the assumption that at least one configuration is not visible by PAC. (3 refs.)

113965 Interactions of defects with Co implanted into Al at 4.2K. E. Verbiest, H. Pattyn (Inst. voor Kern- en Stralingsfysika, Univ. of Leuven, Leuven, Belgium).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.410-12

Presented are the results of a mathematical model to calculate the concentrations of mono- and di-interstitials, mono- and divacancies and the interstitial and vacancy clusters and the fractions of Co impurity atoms associated with these defects as a function of the irradiation dose and during a thermal annealing treatment. The Co-defect fractions have been measured using Mossbauer spectroscopy and these experimental results have been used to check the model calculations and to adjust certain parameters. (4 refs.)

113966 Interaction of vacancies and self-interstitials with interstitial solute atoms in α -iron. J. Diehl, M. Weller, W. Mensch (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.413-16

An overview is given of the complexes generated in α -iron after low temperature irradiation by reactions between intrinsic defects and carbon atoms in solid solution, as they are revealed by internal-friction and magnetic aftereffect measurements. By correlation of both techniques precise values of the reorientation parameters are obtained. Formation, stability and configurations of the various complexes are discussed in the light of recent observations, including those on their symmetries. (17 refs.)

113967 Strong interaction between vacancy and solute in gold. J. Takamura (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.431-6

On isochronal annealing of quenched-in resistivity in dilute gold alloys containing Ge, Sn and Sb, the consecutive motion of vacancy-solute pairs has been observed owing to the strong binding between a vacancy (V) and a solute atom (S). The anomalous annealing behaviours in these alloys are fully understood in terms of the motion of VS pairs, which leads to the successive formation and dissociation of multiple complexes V_nS_i ($i,j \geq 1$), eventually stacking fault tetrahedra and voids. The nature of vacancy-solute complexes and the nucleation kinetics of microvoids are discussed. (24 refs.)

113968 A positron lifetime study of vacancy-solute complexes in dilute gold alloys. Y. Shirai, T. Hamamoto, T. Takeshita, K. Furukawa, J. Takamura (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.441-4

Positron lifetime measurements have been made for vacancy-solute complexes in quenched dilute gold alloys containing multi-valent solutes such as Ge, Sn and Sb. Based on the two-component analysis, the vacancy-solute binding energies in these alloys were estimated as 0.37 ± 0.05 eV in good agreement with the results of the resistivity study. The lifetime (τ) and the specific trapping rate (ν) for vacancy (V)-solute (S) complexes were also determined, which are in order of magnitude as $\tau_{V2S2} > \tau_V > \tau_{VS} \gg \tau_{VS2} > \tau_{VS3} > \tau_{VS4}$. In addition, a marked increase in the defect lifetime, indicative of the nucleation of microvoids, has been first observed on isochronal annealing of the quenched gold alloys. (6 refs.)

113969 Study of vacancy-solute interactions in dilute Al based alloys by thermal equilibrium measurements of positron annihilation. K. Ito, Y. Ohtsu, K. Shima, S. Tanigawa (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.453-6

Thermal equilibrium measurements of the Doppler broadened line shapes of annihilation radiations have been applied to a series of aluminum based dilute alloys (Al-0.5 at.% Li, Al-0.5 at.% Mg, Al-0.18 at.% Ca, Al-0.03 at.% Cu and Al-0.08 at.% Mg). The temperature dependence of line shape parameter in dilute alloys was found to be quite different from that in pure aluminum. In the intermediate temperature range, the formation of vacancy-solute pairs was found. The derived values for the vacancy-solute binding enthalpy were 0.08 ± 0.04 eV for lithium, 0.10 ± 0.04 eV for magnesium, 0.02 ± 0.04 eV for calcium, 0.09 ± 0.04 eV for copper and 0.09 ± 0.04 eV for silver, respectively. In the high temperature range, the line shape parameter in dilute alloys showed an abrupt increase toward the melting points. This effect was attributed to the formation of divacancy-solute pairs and suggests the existence of strong interactions with large binding enthalpy or large binding entropy between a divacancy and a solute atom. (9 refs.)

113970 Interaction and charge transfer between vacancy and solute in dilute aluminum alloys. M. Koike, K. Furukawa, J. Takamura, H. Hira, N. Yamamoto, F. Nakamura (Dept. of Metal Sci. & Technol., Kyoto Univ., Kyoto, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.457-60

A summary report based on detailed analyses of quenched-in resistivities in dilute Al alloys is made on the vacancy-solute binding energy and entropy, and also on the resistivity contribution of vacancy-solute pairs. Particular attention is drawn to the binding entropy whose values are negative and large, indicating that the vibrational frequency is much reduced upon binding. The values of the binding entropy can be correlated to the rate of electron transfer which has been calculated by the Thomas-Fermi method. It is also shown that the rate of electron transfer becomes larger for larger core radii of solute atoms. (13 refs.)

113971 Mossbauer study on Fe-vacancy interaction in aluminum. S. Nasu, M. Kiritani (Dept. of Material Phys., Osaka Univ., Osaka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.461-4

^{57}Fe Mossbauer spectroscopy was used to discuss about Fe-vacancy interaction in aluminum. Satellite lines have been observed in low-temperature deformation experiment and suggested the satellites are due to the multiple complex reactions between Fe and vacancies. On the other hand, the satellite observed in quench-experiment suggested that binding energy between Fe and vacancy is rather small. Origin of the satellite seems to be different in both experiments, but isomer shift values are quite similar with each other. (2 refs.)

113972 Formation of vacancies in thermal equilibrium in α -range alloys. T. Hehenkamp (Inst. fur Metallphys., Univ. Gottingen, Gottingen/Clausthal, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.465-8

A model for aggregates (complexes) between vacancies and one or more impurity atoms is described for nearest neighbor interactions. Binding enthalpies in the different complexes have been unambiguously derived therefrom employing a variety of experimental techniques for the determination of vacancy concentrations as function of composition and temperature, (resistivity, positron annihilation, calorimetry, dI/dA techniques), for some noble metals alloys. Solvent diffusion in these alloys has been found to be essentially governed by the increase of vacancy concentrations as function of these variables. Approximation for changes in the migration and correlation permits one to obtain the different binding enthalpies from measurements of solvent diffusion enhancement in an independent fashion and gives comparable results to the former techniques. (13 refs.)

113973 Mossbauer analysis on the annealing process of a quenched Al-Sn dilute alloy. M. Taniwaki (Div. of Electronic Engng., Hokkaido Univ., Sapporo, Japan), S. Uemeyama, Y. Ishida.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.477-80

The interactions between Sn and vacancies during annealing process of a quenched Al-45 ppm Sn alloy are studied directly by Mossbauer effect. The binding energy between a Sn atom and a vacancy is 0.10-0.15 eV and this value is much smaller than those obtained by others. But stable Sn vacancies aggregates retard the recovery of Al alloys. (11 refs.)

113974 Recovery in electron irradiated aluminium observed by Mossbauer spectroscopy. S. Uemeyama, K. Sassa (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan), M. Taniwaki, Y. Ishida, H. Yoshida.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.481-4

Recovery of vacancies in prequenched and electron irradiated aluminium is studied using Mossbauer spectrum of ^{57}Co . The growth of Co-vacancy clusters occurs at 175K, showing that the vacancies migrate at the temperature. Above the stage, no interaction is detected between vacancies and Co atoms. The interaction between Co impurity and single vacancy appears to be weak. (12 refs.)

113975 Solute atom-dislocation interactions studied by ultrasonic method. Y. Hiki, T. Kosugi (Tokyo Inst. of Technol., Tokyo, Japan), K. Mizuno, T. Kino.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.753-5

Frequency dependent decrement caused from dislocation damping in zone-refined and neutron-irradiated aluminum single crystals was measured, and changes of dislocation density and pinning length with aging time were studied. The solute atom (silicon)-dislocation binding energy and the diffusion constant of solute atom in the crystals were determined. (7 refs.)

113976 Interaction of implanted impurities with extended defect configurations in tungsten single crystal. J. Claes, M. Rots (Inst. voor Kern-en Stralingsfysika, Katholieke Univ. Leuven, Leuven, Belgium).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.756-8

Using a special feature of the perturbed angular correlation technique, the authors have demonstrated that the energy of the heavy ion cascade is anisotropically distributed over close packed planes in the cubic lattice. Implanted impurity interaction with extended loop configurations was observed where the deposited energy density is high and the impurity insoluble in the host. In addition the effect of temperature on the impurity nearest neighbour geometry in such a defect cluster was measured in the 77-520K range. (2 refs.)

113977 Calculation of interaction energies between point defects and (1/2) (111) dislocation in BCC transition metals (self-interstitial and interstitial solute atom). A. Sato, K. Masuda (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.759-61

Selfenergies of various lattice imperfections, a straight screw dislocation, split selfinterstitials and an interstitial carbon, are calculated and their stabilities are examined by using a tight-binding type electronic theory coupled to the moments approach. Introducing the most stable type of a point defect into a screw dislocation core, the interaction energy is calculated as a function of the point defect orientation and the location with respect to the dislocation. (11 refs.)

113978 Electronic interaction between impurity and grain boundary in iron. M. Hashimoto, Y. Ishida (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan), R. Yamamoto, M. Doyama, T. Fujiwara.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.776-9

The electronic structures in both the pure and phosphorus segregated iron boundary were calculated by the recursion method using the model structure. The results showed that strong bonds are formed between the P-atom and Fe-atoms nearest to the P-atom, while the bonds between these Fe-atoms and their surrounding Fe-atoms are weakened. (6 refs.)

- 113979 Effect of the interaction between solute atoms and defects on formation of defect clusters.** H.Takahashi, T.Takeyama, S.Ohnuiki, T.Kato (Metals Res. Inst., Hokkaido Univ., Sapporo, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.861-4.
- The behavior of defect cluster formation has been studied in Fe-Ti, Fe-Mn, Fe-Mo alloys and Fe during electron irradiation in an electron microscope operated at 650 or 1000 kV in the temperature range between 525 and 725K. Interstitial type dislocation loops initially nucleated and grew during irradiation of all the specimens used. By prolonged irradiation voids were formed in Fe, Fe-Mo and Fe-Mn alloys, but in Fe-Ti alloy void nucleation was suppressed with increasing Ti content, and instead of it small dislocation loops which seemed to be of vacancy type were formed near the interstitial type loops formed initially. The activation energies for migration obtained from the temperature dependence of the growth speed of interstitial loops were 0.58 eV for Fe-0.1 at.% Ti alloy and 1.21-1.42 eV for Fe and the other alloys used, which suggest the interaction between solute and vacancy. (6 refs.)
- 113980 A role of helium and hydrogen atoms in the formation of interstitial loops.** N.Yoshida, E.Kuramoto, K.Kitajima (Res. Inst. for Appl. Mech., Kyushu Univ., Fukuoka, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.869-72.
- Formation processes of defect clusters in Mo and W due to the irradiation of He⁺ and H⁺ were investigated by means of TEM. Vacancy-He atom complexes are considered to act as nucleation sites of interstitial type dislocation loops. In the case of H⁺ irradiation it was found that platelike hydrogen clusters were formed. (9 refs.)
- 113981 Interaction of dislocations with impurities and its influence on the mechanical properties of silicon crystals.** K.Sumino (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.307-21.
- A review is presented of the work on the influence of impurities on the dynamic behavior of dislocations in silicon crystals and also on the resulting effects in the mechanical strength performed by the author's group. Special emphasis is laid on the effects of light element impurities such as oxygen, nitrogen and carbon. Although all of these impurities do not affect the velocities of dislocations moving under relatively high stresses, oxygen and nitrogen atoms are found to lock slowly moving dislocations and dislocations at rest very effectively. Such locking of dislocations results in the decreases in the activities of generation and multiplication centers for dislocations, leading to the strengthening of the crystals. The high strength of silicon crystals brought about by the impurities is lost when the crystals are subjected to the heat treatments which allow the precipitation of the impurities on a macroscopic scale. This softening is shown to be caused by dislocations punched out from precipitates and by the exhaustion of the impurities dissolved in the matrix crystal. (33 refs.)

61.80 RADIATION DAMAGE AND OTHER IRRADIATION EFFECTS

(for techniques of structure determination, see 61.10 to 61.16; for electron and ion impact phenomena, see 79.20)

- 113982 Life performance of an EPR-insulated power cable exposed in service beyond 3 MGy in a high-level radiation area.** R.Grub, B.Langeset, P.Maier, H.Schonbacher (CERN, Geneva, Switzerland). Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.469-80 (1 Sept. 1983).
- Mechanical and electrical test results are reported for a power cable that has been installed for three and a half years in a high-level radiation area at the

European Organization for Nuclear Research (CERN). The degradation of selected mechanical properties as a function of absorbed dose is compared with results of a short-term irradiation in a nuclear reactor. The tensile test specimens have been taken from the ethylene propylene rubber insulation and the polyvinyl chloride sheath material of the cable after exposure in service. For the measurement of breakdown voltage, short portions of insulated cable have been used. The aim of this work was to verify that the combined functional and environmental stress factors did not lead to more damage of the cable than was expected from the value of absorbed dose, and eventually to predict more precisely the service life of similar cables. The ratios of doses after service and short-term irradiation at 50% reduction of elongation at break were about 0.5 for the insulation and 1.0 for the sheath material at a dose of about 1 MGy. However, the breakdown voltage did not show any significant variation in the dose range covered up to 3.6 MGy. Therefore, a safe lower dose limit may readily be derived from accelerated tests, but the margin until failure in service remains to be determined. (11 refs.)

- 113983 Backscattering observation of radiation damage in optical fibers.** F.Menaglia, L.Piccarini (Fondazione U. Bordon, Roma, Italy), M.Bertolotti, A.Serra, A.M.Scheggi. Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.4120-16 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

The use of light backscattering in a fiber is suggested as a probe for hot radiation points in nuclear environments. Preliminary experiments show the feasibility of the method. (6 refs.)

- 113984 Helium bubbles in palladium tritide.** G.J.Thomas, J.M.Mintz (Sandai Nat. Labs., Livermore, CA, USA).

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.336-8 (June 1983).

A study was carried out in order to determine the fate of He born in a metal tritide, PdT_{0.6}, without (a) irradiation damage, (b) other impurities or phases present, and (c) thermal cycling. Microscopic evidence is presented which clearly shows that He can spontaneously generate bubbles and dislocation loops at room temperature in a metal tritide. It is recognized that hydrogen (tritium) itself can produce dislocation structures upon hydriding and dehydriding effects which are separate and distinct from those described here. (5 refs.)

- 113985 Vacancy-interstitial recombination coefficients in radiation-induced growth models.** G.V.Kidson (Materials Sci. Branch, Whiteshell Nuclear Res. Establ., AECL, Pinawa, Manitoba, Canada).

J. Nucl. Mater. (Netherlands), vol.118, no.1, p.115-20 (Aug. 1983).

The jump method for the calculation of the intrinsic recombination coefficient α^* for vacancies and interstitials, as used in the analysis of radiation-induced growth in metals, is re-examined. A straightforward procedure is presented which can accommodate simple or complex defect configurations in isotropic or anisotropic lattices. The method is applied to two recent analyses (1980) of radiation growth in HCP zirconium. It is shown that differences in the values of α^* are not, as previously suggested, associated with the interstitial configuration, but with an inconsistent definition of the atomic jump frequencies. The removal of the inconsistency is such that it would improve the agreement between calculated and measured growth rates in one of the analyses. (15 refs.)

- 113986 Appearance of an impurity ionization mechanism of defect formation in indium antimonide as a result of 'suprathreshold' irradiation.** T.V.Mashovets, N.A.Vitovskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.326-7 (March 1983). Translation of: Fiz. & Tekh. Poluprovodn. (USSR), vol.17, no.3, p.521-3 (March 1983). [received: Sept. 1983]

It has been shown that the impurity ionization mechanism (IIM) is very effective when indium antimonide is subjected to 'suprathreshold' irradiation. In the case of germanium with a sufficiently high concentration of shallow donors the IIM may be more effective than the elastic displacement mechanism even in the case of 'suprathreshold' irradiation. The authors analyze some characteristic features of the IIM in the case of binary semiconductors that have not been understood clearly before and show that in the case of indium antimonide the IIM may be observed for 'suprathreshold' irradiation under conditions such that intrinsic defects are immobile. (7 refs.)

- 113987 Low-temperature exciton decay with production of defects in KBr and KBr-Cl.** M.M.Tairov (Inst. of Phys., Acad. of Sci., Tartu, Estonian SSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.254-7 (Feb. 1983). Translation of: Fiz. Tverd. Tela (USSR), vol.25, no.2, p.450-5 (Feb. 1983). [received: Sept. 1983]

The spectra of anion Frenkel defects created by 6.5-7.5-eV photons in crystals of KBr and KBr-Cl at 4.2K are measured by highly sensitive luminescence techniques. Long-lived pairs of neutral defects (F-H pairs) and charged defects (α -I pairs) are created upon self-localization of optically created excitons. In crystals of KBr containing 1% KCl, F and H centers distorted by Cl⁻ ions (the H_{Cl} centers are stable up to 65K), and also anion vacancies and interstitial Cl₂⁻ ions (stable up to 95K), are formed on the decay of the excitons. Mechanisms of defect formation in KBr and KBr-Cl are discussed. (27 refs.)

- 113988 Applications of a continuous wave incoherent light source (CWILS) to semiconductor processing.** H.B.Harrison, S.T.Johnson, B.Cornish, F.M.Adams, K.T.Short, J.S.Williams (Faculty of Engng., Royal Melbourne Inst. of Technol., Melbourne, Australia).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.393-9.

The authors present results which highlight applications of a continuous wave incoherent light source in the processing of semiconductor devices. In particular, damage removal and activation of ion implanted gallium arsenide is demonstrated for both capless and capped annealing of low dose implants at temperatures of >800°C for times <10 s. For gallium arsenide FET applications, they demonstrate that it is possible to simultaneously carry out activation, contacting and interconnection steps by utilizing thermomigration processes which are not available with conventional furnace processing. In silicon they demonstrate that shallow multi layer bipolar structures can be successfully fabricated with anneal cycles that lead to supersaturation effects and negligible diffusion. (14 refs.)

- 113989 Beam processing of silicon with a scanning CW Hg lamp.** T.Stultz, J.Sturm, J.Gibbons (Stanford Electronics Lab., Stanford, CA, USA).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.463-76.

A scanning arc lamp annealing system has been built using a 3" long mercury arc lamp with an elliptical reflector. The reflector focuses the light into a high intensity narrow line source. Silicon wafers implanted with 100 keV ⁷⁵As⁺ to 1×10¹⁵ cm⁻² have been uniformly annealed with a single scan,

resulting in complete activation and negligible redistribution of the implanted species. Using a scan rate of 1 cm/s, entire 3" wafers have been annealed in less than 10 seconds with this system. The system has also been used to recrystallize thin films of polysilicon deposited on thermally grown silicon dioxide. The crystallized films contain grains that are typically 0.5-1 mm in width and several centimeters long. Surface texture measurements show the crystallites to be almost entirely (100) in the plane of the film with the orthogonal (100) direction closely paralleling the scan direction. MOSFETs were fabricated in these films with surface mobilities 66% of ones fabricated in single crystal silicon. An epitaxial layer with the same crystallographic features as the recrystallized film was grown on the film itself. (18 refs.)

113990 Molecular dynamics simulation of displacement cascades in Cu: analysis of replacement sequences. W.E.King, R.Benedek (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.807-10

Molecular dynamics computer simulations of displacement cascades in copper have been performed for recoil energies up to 450 eV. Statistical analyses of the atomic replacements are presented. Linear replacement sequence lengths are extremely short on the average. The effect of the cooling phase of the cascade is discussed. (12 refs.)

113991 The damage function based on the focusing collision model. H.Sakairi, E.Yagi, A.Koyama (Inst. of Phys. & Chem. Res., Wako, Japan), R.R.Hasiguti.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.818-20

The Snyder-Neufeld integral equation of the damage function was numerically solved under a boundary condition which includes the effect of focused replacement. The result can be well approximated by the Kinchin-Pease like formula, $\nu(E_i) = E_i / (E_3 + E_i)$. A ratio of the number of Frenkel pairs in irradiated Cu and Au which was calculated with this formula is quite consistent with the experimental value. The absolute value of ν_{Fe} in Cu can be given with a constant factor $k (=0.6)$: $\nu(E_i) = 0.6 E_i / (E_3 + E_i)$. (12 refs.)

113992 Kinetics of the order-disorder reaction under irradiation. S.Banerjee, U.D.Kulkarni (Metall. Div., Bhabha Atomic Res. Centre, Bombay, India), K.Urban.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.853-6

A model has been developed to study the kinetics of the order-disorder transition under irradiation. In this model vacancies at different sublattice sites are distinguished and their steady state concentrations are evaluated as a function of the order parameter, S. The rate of change of the order parameter, dS/dt , is expressed in terms of various radiation and sample parameters so that the influence of these factors can be assessed. This formulation has been applied to some specific systems such as Cu_3Au and Ni_3Mo in order to compare the theoretical results with the available experimental data. (7 refs.)

113993 Monte-Carlo simulation of void nucleation during irradiation. T.Muroga, S.Ishino (Dept. of Nuclear Engng., Univ. of Tokyo, Tokyo, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.895-8

A Monte-Carlo calculation has been carried out to simulate void nucleation process in which defects are moved in random walks on BCC and FCC lattices. Optimum values of interstitial and helium concentrations as well as temperature are found to exist for cluster growth. (10 refs.)

113994 Theoretical relationships between creep and swelling by point defect absorption during irradiation. L.K.Mansur, W.A.Coghlan (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.907-12

Relationships between irradiation creep and swelling implicit in the theories of these processes are derived. Four mechanisms of irradiation creep are treated. These are the climb only process of preferred point defect absorption on dislocations; the climb and glide processes resulting from cumulative absorption of defects at dislocations, i.e. preferred absorption glide and swelling-driven creep; and the recently developed climb and glide process enabled by point defect concentration fluctuations resulting from cascades. The results are expressed both as differential equations for creep rate in terms of swelling rate and as integrated forms giving creep strain in terms of swelling for stabilized microstructures. (18 refs.)

113995 Irradiation induced solid solution instability. G.Martin, R.Cauvin, J.-L.Bocquet, A.Barbu (Section de Recherches de Metall. Phys., CENS, Gif-sur-Yvette, France).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.923-30

The authors summarize the main experimental evidences and successful theories for irradiation induced precipitation in undersaturated solid solutions. The solubility limit under irradiation is shown to be flux dependent. Simple expressions thereof are given. Complicated coupling of the solubility limit to the microstructural evolution is anticipated but not yet properly modeled. (48 refs.)

113996 Recombination-driven precipitate coarsening in alloys under irradiation. K.Urban (Inst. fur Phys., Max-Planck-Institut fur Metallforschung, Stuttgart, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.942-5

A new theory for the coarsening of precipitates in alloys under irradiation is described. It is shown that point-defect recombination on solute clusters leads to a reduction of the solute solubility limit and to a novel driving force for coarsening. Taking the classical coarsening theory as reference irradiation leads with increasing mean radius to a modification of coarsening in 3 phases: (1) Acceleration of coarsening accompanied by a widening of the size distribution; (2) retardation of coarsening and narrowing of the distribution; (3) approach to classical behaviour. 61.80B Laser beams

113997 Subnanosecond pulsed laser annealing of Si-implanted InP. B.Tell, J.E.Bjorkholm, E.D.Beebe (Bell Labs., Holmdel, NJ, USA).

Appl. Phys. Lett. (USA), vol.43, no.7, p.655-7 (1 Oct. 1983). Indium phosphide implanted with Se^{+} has been laser annealed with 70 ps pulses at both $\lambda=0.53$ and $1.06 \mu m$. For doses of $1 \times 10^{15} cm^{-2}$ activations of $\sim 70\%$ with peak electron concentrations of $6 \times 10^{19} cm^{-3}$ have been achieved, while for doses of $3 \times 10^{15} cm^{-2}$, activations of 33% with peak electron concentrations of $1.2 \times 10^{20} cm^{-3}$ were measured. The carrier depth profiles for the laser annealed samples are shallow while those for thermal annealing are broad compared to the as-implanted profiles. The morphology of the laser annealed spots is briefly discussed. (19 refs.)

113998 Surface damage of transparent dielectrics and semiconductors by high-power laser pulses. Y.T.Vassilev (Faculty of Phys., Univ. of Sofia, Sofia, Bulgaria).

Bulg. J. Phys. (Bulgaria), vol.10, no.3, p.344-52 (1983). The surface damage by short and ultrashort laser pulses passing through solid state transparent media has been studied theoretically under the assumption that the pressure of the laser light is a real damage mechanism. Analytical expressions for the damage thresholds of the entrance and exit surfaces as well as for their ratio have been obtained. These expressions may be used to interpret more accurately and correctly the experimental findings on surface damage of solid transparent dielectrics and semiconductors. (17 refs.)

113999 Emission of melt during laser vaporization of metallic films. V.P.Veiko, A.I.Kaidanov, E.A.Tuchkova, E.B.Yakovlev.

Elektron. Obrab. Mater. (USSR), no.3, p.18-21 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*. A theoretical model of the emission of melt from the zone of vaporization during laser irradiation of metallic films is examined. It is shown that a molten metallic film can be regarded as a plane boundary layer, movement of which results from the action of an output pulse during vaporization. In this connection a study is made of the influence of surface tension forces, the adhesion of the film to the substrate, and viscous friction in the molten layer. The kinetics of emission and the phase composition of the products of the laser destruction of thin films are also investigated. (7 refs.) *A.J.B.*

114000 Direct observation of the melting of a semiconductor during pulsed laser annealing. V.N.Abakumov, O.V.Zelenova, Yu.V.Koval'chuk, E.L.Portnoi, V.B.Smirnitskii, I.A.Sokolov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.586-7 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1365-8 (Nov. 1982). [received: Sept. 1983]

Reports an attempt to directly observe melting of the surface of a semiconductor subjected to pulsed laser bombardment. In the experiments, a regular sawtooth profile with a period $\approx 2 \mu m$ is produced on the (100) surface of a single-crystal gallium arsenide wafer. After this preparation, the samples are subjected to pulsed bombardment by a ruby laser ($\lambda=0.69 \mu m$). (5 refs.)

114001 Introduction [laser annealing of semiconductors]. J.M.Poate (Bell Labs., Murray Hill, NJ, USA), J.W.Mayer.

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.1-14. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

The authors discuss direct energy processing of semiconductors using lasers. Energy deposition and heat flow are briefly reviewed. Studies of surfaces and interfaces are discussed. The use of lasers for epitaxial regrowth and alloying is outlined and a brief mention is made of surface crystallization. (no refs.)

114002 Crystallization processes [laser annealing of semiconductors]. F.Spaepen, D.Turnbull (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA).

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.15-42. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

Discusses the melting and solidification that may occur during laser annealing. Although crystallization is the thermodynamically preferred mode of solidification, a melt may under certain conditions solidify to an amorphous solid. (48 refs.)

114003 Fundamentals of energy deposition [laser annealing of semiconductors]. M.F.von Allmen (Inst. of Appl. Phys., Univ. of Bern, Bern, Switzerland).

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.43-74. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

Reviews the main mechanisms of interaction of photon and electron beams with condensed matter from the point of view of energy deposition. The influence of coupling phenomena on the final sample temperature is discussed. Beam intensities of interest range up to about $10^8 W/cm^2$, sufficient to heat and even melt the surface region of the irradiated material. Even though the basic mechanisms of absorption are well known, coupling phenomena in this high-flux regime are not as well understood as they are at low intensities. (50 refs.)

114004 Heat flow calculations [laser annealing of semiconductors]. P.Baeri, S.U.Campisano (Istituto di Struttura della Materia, Univ. di Catania, Catania, Italy).

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.75-109. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

Heating in an irradiated sample is a consequence of the balance between the deposited energy, governed by optical parameters of the sample and characteristics of the laser pulse, and the heat diffusion, determined by thermal parameters and the pulse duration. In the two limiting cases in which the optical absorption depth is small compared with the thermal diffusion length during the pulse, and vice versa, simple estimates of the temperature rise have been outlined by Bloembergen (1979). However, in many practical cases, exact calculations are needed, and complex analytical or numerical evaluations must be used. In particular, for phase transitions occurring during the irradiation, only numerical solutions are available. The mathematical problem is stressed and a set of numerical solutions are given in order to cover a broad range of cases of practical interest. The calculations presented in these sections agree well with experimental data. However, if more exact knowledge of the optical and thermal parameters becomes available, their numerical values could change, but the trends will still be valid. Simple scaling rules are given for this purpose. Applications to Ge and GaAs are presented. The problem of diffusion and segregation of impurities during the liquid transient produced by the laser pulse is considered. The effect of a very long pulse duration is outlined. Appendixes report details of the numerical method used to solve the heat and mass transport equations. (33 refs.)

114005 Supersaturated alloys, solute trapping, and zone refining [laser annealing of semiconductors]. C.W.White, B.R.Appleton (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), S.R.Wilson.

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.111-46. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

The authors discuss studies of high-speed crystal growth achieved by laser annealing of ion-implanted silicon. These studies show that Group III and V impurities can be incorporated by solute trapping into substitutional lattice sites at concentrations that far exceed equilibrium solubility limits. Values for the interfacial distribution coefficient are much greater than equilibrium values because of the high velocity of the liquid-solid interface. Values for k' are functions of both growth velocity and crystal orientation. For each Group III and V dopant there is a maximum concentration C_s^{\max} that can be incorporated substitutionally into the lattice, and values for C_s^{\max} are functions of growth velocity. Mechanisms that limit substitutional solubilities are discussed. Values obtained for C_s^{\max} are compared with recent predictions of thermodynamic limits of solute trapping in silicon. Finally, the behavior exhibited by Group III and V species is contrasted with that exhibited by interstitial species (such as Cu, Fe) where, for low concentrations, complete zone refining to the surface can be achieved. (37 refs.)

114006 Solid phase regrowth. J.F.Gibbons, T.W.Sigmon (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA).

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.325-81. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

Reviews the areas of continuous-wave (CW) beam processing of semiconductors that can be adequately understood in terms of solid phase regrowth mechanisms. For this purpose the authors begin with a brief review of solid phase regrowth results obtained from low-temperature (400-600°C) furnace annealing experiments and then proceed to discuss parallel results obtained when a scanning CW laser or electron beam is used to promote the regrowth process. In most of this discussion they treat the scanning CW beam system as being equivalent to a high-temperature, short-time-duration annealing furnace with large heating and cooling rates. In most cases CW beam processing causes solid phase regrowth and diffusion to occur at rates that can be obtained from a straightforward extrapolation of the low-temperature furnace results. It is possible to calculate the spatial temperature profile by assuming steady state heat flow in a moving frame of reference. Such calculations provide the theoretical basis for the relationship between the beam processing parameters and solid phase regrowth mechanisms. (70 refs.)

114007 Compound semiconductors [laser and electron beam annealing]. J.S.Williams (Dept. of Communications & Electronic Engng., Royal Melbourne Inst. of Technol., Melbourne, Victoria, Australia).

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.383-438. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

Laser and electron beam applications in the processing of compound semiconductors are reviewed, with particular emphasis on GaAs. The author concentrates on the two particular applications of transient annealing that have received the most attention in the literature: (i) the removal of ion implant damage and dopant effects in GaAs, and (ii) the formation of ohmic contacts to compound semiconductors. An attempt has been made to correlate the available physical and electrical data and to present current understanding of the various transient annealing processes. Solid phase annealing of ion-implanted GaAs is discussed, and results of conventional furnace processing are compared with the sparse data available on transient annealing. The author discusses pulsed (liquid phase) annealing in implanted GaAs, a topic that has been of considerable recent interest. Transient annealing both in the formation of ohmic contacts to GaAs and in the mixing of deposited layers with GaAs is examined. Finally, the available data on compound semiconductors other than GaAs are reviewed. (80 refs.)

114008 Silicides and metastable phases [laser annealing]. M.F.von Allmen (Inst. of Appl. Phys., Univ. of Bern, Bern, Switzerland), S.S.Lau.

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.439-78. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

The authors discuss reactions in metal semiconductor systems subject to fast melting and solidification. In their discussion, a brief summary of solid state reactions is given first, followed by an introduction to general concepts of laser-induced melting, mixing and quenching. Experimental results of laser-induced interactions in metal-semiconductor systems are presented. The composition and phases in the reacted layers depend on the pulse energy via the melt depth. The structure of the mixed layers is often laterally nonuniform and cellular in nature as a result of constitutional supercooling. Because of the very rapid solidification from the melt, not all alloys and compounds formed are necessarily thermodynamically stable. Alternatively, amorphous phases over extended compositional ranges may be obtained under appropriate conditions. Pulsed irradiation, therefore, permits a systematic search for, and the investigation of, metastable phases inaccessible by other means. These results are in marked contrast to those obtained with furnace or continuous-wave scanning laser annealing, where simple and uniform reactions take place in the solid phase. (49 refs.)

114009 Factors influencing application [laser annealing of semiconductors]. C.Hill (Plessey Res. (Caswell), AllenClark Res.Centre.Ltd., Caswell, England).

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.479-557. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

In order to discuss the criteria for applications systematically, the techniques for beam processing have been classified into three basic modes, determined by pulse length, and the materials changes that can be effected have been grouped into six basic categories. The factors involved in control of the heat treatment process are covered. The occurrence of secondary effects and compatibility with other process steps and structures are dealt with. The problems of processing large areas of material rapidly and the economics of beam processing are also considered. (130 refs.)

114010 Effect of pulse duration on the annealing of ion implanted silicon with a XeCl excimer laser and solar cells. R.T.Young (Helionetics Inc., San Diego, CA, USA), J.Narayan, W.H.Christie, G.A.van der Leeden, D.E.Rothe, R.L.Sandstrom.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.401-6. The advantages of pulsed excimer lasers for semiconductor processing are reviewed. Studies of XeCl excimer laser annealing with pulses of 25 and 70 nsec duration and energy densities in the range from 0.5-3.0 J/cm² are discussed. The annealing characteristics are described in terms of the results of melt depth, dopant profile spreading, and electrical properties (sheet resistivity, diode characteristics) measurements. Solar cells with efficiencies as high as 16.7% AM1 have been fabricated using glow discharge implantation and XeCl laser annealing. (8 refs.)

114011 Pulsed excimer laser (308 nm) annealing of ion implanted silicon and solar cell fabrication. D.H.Lowndes, J.W.Cleland, W.H.Christie, R.E.Eby, G.E.Jellison, Jr., J.Narayan, R.D.Westbrook, R.F.Wood (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), J.A.Nilson, S.C.Dass.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.407-12

A pulsed ultraviolet excimer laser (XeCl, 308 nm wavelength, 40 nsec FWHM pulse duration) has been successfully used for laser annealing of both boron- and arsenic-implanted silicon. TEM, SIMS, and sheet electrical measurements are used to characterize specimens. C-V and I-V measurements demonstrate that near-ideal p-n junctions are formed (diode perfection factor A=1.2). Electrical activation of implanted ions by single laser pulses is essentially complete for energy densities $E_j \geq 1.4$ J/cm², far below the threshold for substantial surface damage ~ 4.5 J/cm². Melting model calculations are in good agreement with observed thresholds for dopant redistribution and for epitaxial regrowth. Changes in annealing behavior resulting from multiple (1,2,5) laser pulses are also reported. Finally, the authors demonstrate the use of scanned overlapping excimer laser pulses for fabrication of large area (2 cm²) solar cells with good performance characteristics. In contrast to pulsed ruby laser annealing, high open circuit voltages can be obtained without the use of substrate heating. (12 refs.)

114012 Selective laser annealing for device processing. I.D.Calder, A.A.Naem, H.H.Naguib (Bell-Northern Res., Ottawa, Ontario, Canada).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.443-8. Selective laser crystallization of undoped polysilicon films has been achieved through the use of a patterned Si₃N₄ anti-reflection (AR) coating. The recrystallized poly-Si beneath the AR cap exhibits an etch rate 50-90% lower than the surrounding uncapped material, allowing anisotropic etching of poly-Si for the fabrication of MOSFET gates. Undercut is reduced by at least a factor of two from unannealed material. Annealed edge profiles are uniform within ± 0.03 μ m for plasma etching (± 0.05 for wet etching) compared to ± 0.1 μ m (± 0.25 μ m for wet etching) for unannealed regions. The sheet resistivity of 0.5 μ m films doped by phosphorus diffusion was reduced from an initial value of 82 ± 5 Ω/\square to 40 ± 8 Ω/\square when the dopant was diffused into recrystallized poly-Si and to a final value of 10.2 ± 0.2 Ω/\square after a further laser activation step. Potential applications in VLSIC processing are discussed. (10 refs.)

114013 Characterization and application of laser induced seeded-lateral epitaxial Si layers on SiO₂. M.Miyao, M.Ohkura, T.Warabisako, T.Tokuyama (Central Res. Lab., Hitachi Ltd., Tokyo, Japan).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.499-510

Electrical and crystal properties of seeded lateral epitaxial Si are evaluated as a function of distance from seeding area with the aid of a micro-probe RHEED and MOSFET fabrication. The results indicate that the quality of a grown layer is as good as that of bulk Si crystal for most of the epitaxial layer. However, at the SiO₂ edge, electrical properties are somewhat poor due to the existence of dislocations and residual stresses. Element devices useful for SOI structures are fabricated. Electrical properties of MOSFETs with double active area indicate that surface and bottom regions of the epitaxial layer are all of device worthy quality. Insulated control gate bipolar type transistors are proposed and some preliminary results are shown. (32 refs.)

114014 Oxygen and nitrogen incorporation during CW laser recrystallization of polysilicon. C.I.Drowley, T.I.Kamins (Hewlett-Packard Labs., Palo Alto, CA, USA).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.511-16

The incorporation of nitrogen and oxygen in polysilicon has been examined by SIMS. The analysis, combined with C-V measurements and ion implantation, has been used to correlate the incorporation of the two species with the fixed-charge density at the back polysilicon/SiO₂ interface. Laser recrystallization with a silicon-nitride encapsulation layer results in the inclusion of 2.4×10^{17} cm⁻³ nitrogen atoms in the polysilicon; if an oxide capping layer is used, the nitrogen level observed is at the background of the SIMS system ($\sim 10^{15}$ cm⁻³). Either type of capping layer results in 3.4×10^{18} cm⁻³ oxygen atoms being incorporated into the polysilicon. Implantation of nitrogen into the polysilicon before recrystallization increases the fixed-charge density (N_{fb}) at the back interface, while implanted oxygen decreases N_{fb} . The high N_{fb} found with a nitride capping layer is attributed to deposition of nitrogen of SiN_x at the back interface. (6 refs.)

114015 CW laser annealing of ion implanted oxidized silicon layers on sapphire. G.Alestig, G.Holmen, S.Peterstrom (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.517-22.

CW laser annealing has been performed on silicon on sapphire (SOS) implanted with boron or phosphorus ions to a dose of 10^{15} ions/cm². The laser irradiation was done both with and without an oxide layer on top of the silicon and from both the silicon and the sapphire side. Sheet resistivity and hall effect measurements were used for the analysis of the samples. Good annealing and high activation of the dopants were obtained for both oxidized and unoxidized SOS. For samples irradiated from the silicon side, the needed laser power changed depending on the thickness of the oxide. For samples irradiated from the sapphire side, the needed laser power was independent of oxide thickness. (18 refs.)

114016 Beam shaping for CW laser recrystallization of polysilicon films. P.Zorabedian, C.I.Drowley, T.I.Kamins, T.R.Cass (Hewlett-Packard Labs., Palo Alto, CA, USA).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.523-8. A shaped laser beam has been used for laterally seeded recrystallization of polysilicon films over oxide. Direct maps of the shaped-beam intensity distribution in the wafer plane are correlated with the grain structure of the recrystallized polysilicon. Using 60% overlapping of shaped-beams scans along (100) directions, the authors have obtained seeded areas one mm wide and 50 to 500 μ m long. These consist of 40 μ m-wide adjacent single-crystal strips regularly separated by low-angle grain boundaries extending laterally away from the seed openings. The spacing between grain boundaries is equal to the scan spacing, providing a means for controlling the location of grain boundaries in otherwise defect-free, single-crystal films. (5 refs.)

114017 A comparison of CW laser and electron-beam recrystallization of polysilicon in multilayer structures. C.I.Drowley (Hewlett-Packard Lab., Palo Alto, CA, USA), C.Hu.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.529-34.

A thermal model for beam-induced melting of polysilicon in polysilicon/insulator/silicon structures has been used to compare CW Ar⁺ laser and electron-beam melting processes. The laser melting process exhibits a decreasing recrystallization threshold power and an increasing substrate melting threshold power with increasing insulator thickness. The decrease in recrystallization threshold with increasing insulator thickness is generally smaller for electron beams because of their deep penetration. The substrate melting threshold is approximately independent of insulator thickness for e-beams since no change in the power absorption occurs on melting of the polysilicon. As a result, the process window between the onset of recrystallization and melting of the substrate is narrower for e-beams than for laser beams. Also, essentially no window will exist between the onset of melting over a seed and substrate melting under an oxide if lateral epitaxy is performed with an electron beam. (8 refs.)

114018 Laser-induced crystallization of silicon on bulk amorphous substrates: an overview. D.K.Biegelsen, N.M.Johnson, W.G.Hawkins, L.E.Fennell, M.D.Moyer (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.537-48.

The authors review the current understanding of laser-induced silicon thin film crystal growth on bulk amorphous substrates. They propose a model for oriented nucleation and show that the silicon reflectivity jump on melting coupled with radiant heating lead naturally to this autonucleation mechanism. They then survey various techniques for control of lateral epitaxial growth and conclude with the results of some recent electrical device characterization. (18 refs.)

114019 The effects of selectively absorbing dielectric layers and beam shaping on recrystallization and FET characteristics in laser recrystallized silicon on amorphous substrates. G.E.Possin, H.G.Parks, S.W.Chiang, Y.S.Liu (General Electric Res. & Dev. Center, Schenectady, NY, USA).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.549-56.

Selective absorption, using patterned dielectric films, and beam shaping were used as means for improving the recrystallization of LPCVD polysilicon islands on fused quartz. IR imaging of the laser heated region was used to optimize and control the recrystallization. MOSFETs were fabricated in laser-recrystallized silicon islands on amorphous substrates using a standard n-channel poly-gate process. Devices with various channel lengths and widths were fabricated, and the dependence of threshold voltage, channel mobility, and leakage on recrystallization conditions and device dimensions was studied. (11 refs.)

114020 Laser anealing of ion implanted semiconductors. J.Narayan (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.491-504.

Photon energy from laser beams can be used to rapidly heat and melt localized regions of semiconductors with a high degree of spatial and temporal selectivity. Pulsed lasers have been successfully used to anneal displacement damage and to remove other defects. However, the number density of trapped defects increases with velocity of solidification and finally thin layers turn directly amorphous after laser-melt quenching. Annealing characteristics are found to be a strong function of ion implantation variables, which determine optical properties of materials. By both solid- and liquid-phase crystallization, supersaturated solid solutions can be formed. Residual defects in SPE grown layers primarily consist of dislocation loops. Device applications utilizing these transient thermal processing techniques are reviewed briefly. (21 refs.)

114021 Comparison between thermal and laser annealing in ion-implanted silicon. A.Blosse (Lab. de Phys. des Solides, Lille, France), J.C.Bourgoin.

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.535-9.

N-type, 10^{15} - 10^{16} cm⁻³ doped, Fz, silicon has been implanted with 1 to 4×10^{12} cm⁻², 100 or 300 keV, As ions. The nature and concentration of the defects has been monitored using Deep Level transient Spectroscopy as a function of the thermal treatment (in the range 500-900°C) and of the energy of the pulse (15 ns) of a ruby (0.69 μ m) laser (in the range 0.3 to 0.6 J cm⁻²). The defects resulting from annealing by the two treatments are found to be the same. Only, for energies higher than 0.5 J cm⁻², the laser treatment introduced new defects (at $E_c - 0.32$ eV), presumably resulting from a quenching process. Thus a laser energy below the threshold for melting and epitaxial recrystallization is able to anneal the defects produced by

implantation, demonstrating that the annealing process induced by the laser pulse is not a purely thermal process but probably involves an ionization enhanced mechanism. (9 refs.)

114022 Mobilities of radiation-induced vacancies in Ni₃Al and NIAL studied by positron techniques. M.Shimotomai, T.-M.Wang, M.Doyama (Dept. of Materials Sci., Faculty of Engng., Univ. of Tokyo, Tokyo, Japan).

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.347-8 (June 1983).

Discusses the mobilities of radiation-induced vacancies in Ni₃Al and NIAL probed by positrons. The positron lifetime spectrum for an annealed specimen was well fitted with a single component of $\tau_1 = 110 \pm 5$ ps. This value represents the lifetime of delocalized positrons in Ni₃Al. Upon irradiation the second lifetime component of considerable intensity with $\tau_2 = 180 \pm 5$ ps appeared. This manifests the production of vacancy-type defects in Ni₃Al since positrons preferentially probe defects which have low electron density. (6 refs.)

114023 Void-swelling in cold-worked copper during HVEM irradiation. T.Leffers, B.N.Singh (Metall. Dept., Riso Nat. Lab., Roskilde, Denmark), S.N.Buckley, S.A.Manthorpe.

J. Nucl. Mater. (Netherlands), vol.118, no.1, p.60-7 (Aug. 1983).

Void formation and growth in pure cold-worked copper and the parallel evolution in dislocation structure during HVEM irradiation have been investigated. Degrees of cold work in the range 10-90% rolling reduction and irradiation temperatures in the range 250-450°C have been covered. The cold-worked structure basically survives irradiation. Initially (for low degrees of cold work), void density and swelling rate increase with increasing degree of cold work; they then level off and eventually start decreasing with further cold work. The decrease in swelling rate cannot be explained in terms of a simple increase in dislocation density; one will have to consider the real, heterogeneous dislocation distribution. (2 refs.)

114024 Shrinkage of voids in electron irradiation of thin foils. S.M.Murphy, A.Scott, E.Diana (Theoretical Phys. Div., AERE Harwell, Didcot, England).

J. Nucl. Mater. (Netherlands), vol.118, no.1, p.121-4 (Aug. 1983).

In HVEM experiments, voids close to the surface of the irradiated foil are observed to shrink. Makin suggests (see *ibid.*, vol.71, p.300-8, 1978) that the shrinkage occurs because voids are preferential sinks for interstitials relative to the surface of the thin foil. This is supported by results of some rate theory calculations of the shrinkage of voids within a thin foil. (5 refs.)

114025 Influence of electron irradiation at various temperatures on the minority carrier lifetime in epitaxial silicon p-n structures. F.P.Korshunov, I.G.Marchenko (Inst. of Solid-State & Semiconductor Phys., Acad. of Sci., Minsk, Belorussian SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.340-1 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.540-2 (March 1983).

[received: Sept. 1983]

The authors investigated the influence of electron irradiation at temperatures T_{irr} in the range from -150°C to 330°C on the minority carrier lifetime in the bases of p-n structures made of epitaxial silicon. The measurements of τ were carried out by the Lax-Neustadter method using transient processes of recovery of the reverse resistance of p-n structures (the base material was an epitaxial film of the KEF-0.5 grade). Structures were irradiated using a linear accelerator generating electrons of $E_e = 4$ MeV energy and the density of the fast-electron current was $0.05 \mu\text{A}/\text{cm}^2$. The irradiated samples were annealed at temperatures up to 460°C . The experimental results on changes in τ in p-n

structures irradiated with electrons at T_{irr} ranging from -150°C to 330°C are plotted as a function of the radiation dose Φ . An increase in Φ reduced τ in samples irradiated at 150 – 180°C . At higher irradiation temperatures (270 and 330°C) there was a considerable increase in τ in the dose range 10^{12} – 10^{14} cm^{-2} , whereas at higher doses the value of τ fell. (8 refs.)

114026 Temperature dependence of the critical electron exposure for hydrocarbon monolayers. K.H.Downing (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Ultramicroscopy (Netherlands), vol.11, no.4, p.229-37 (1983).

Effects of electron-beam-induced radiation damage in monolayers of several saturated fatty acids and related molecules have been measured by observation of the fading of electron diffraction patterns produced by the crystalline monolayers. Measurements were made with the specimens at temperatures in the range from about 6 to 310K . Near room temperature, exposures of approximately 50 and $200\text{ electrons/nm}^2$ are required to reduce the intensities of the diffraction patterns of stearic and benenic acids, respectively, to $1/e$ of their initial intensities. These critical exposures increase smoothly as the temperature decreases, to 1600 and 2200 e/nm^2 , respectively, at a specimen temperature of about 6K . A strong correlation was observed between the critical exposures and melting temperatures of the various specimens examined. These results can be interpreted in terms of radiolysis pathways that are highly specific to hydrocarbons. (28 refs.)

114027 Scanning electron beam annealing of oxygen donors in Czochralski silicon. C.J.Pollard, J.D.Speight (British Telecom Res. Labs., Martlesham Heath, England), K.G.Barracough.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.413-18.

The destruction of the oxygen donor complex in Czochralski silicon has been studied using scanning electron beam annealing in the range 550°C to 1050°C for 5 s to 1000 s . A two stage annealing schedule ensured a rapid rise to the target temperature and overscanning provided a uniform, non-distorting heating field. Four point probe and spreading resistance measurements showed a very rapid donor destruction rate above 650°C ; between 550°C and 650°C the lower donor destruction rate allowed a study of the annealing behaviour. (11 refs.)

114028 Arsenic implant activation and redistribution in p-type silicon induced by pulsed electron beam annealing. D.Barbier (Lab. de Phys. de la Matière, Inst. Nat. des Sci. Appliquées de Lyon, Villeurbanne, France), M.Baghdadi, A.Laugier, A.Cachard.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.419-24.

In this work Pulsed Electron Beam Annealing has been used to activate As implanted in (100) and (111) silicon ($140\text{ keV}\cdot 10^{15}\text{ cm}^{-2}$). With a selected electron beam energy deposition profile excellent regrowth layer quality and As activation has been obtained in the 1.2 – 1.4 J/cm^2 fluence range. As redistribution is consistent with the melting model assuming a diffusivity of $10^{-4}\text{ cm}^2/\text{s}$ in liquid silicon. As losses might slightly reduce the carrier concentration near the surface in the case of (100) silicon. However a shallow and highly active N^+ layer have been achieved with optimized PEBA conditions. (6 refs.)

114029 Processing of shallow ($\text{Rp}<150\text{\AA}$) implanted layers with electron beams. G.B.McMillan (Engng. Dept., Univ. of Cambridge, Cambridge, England), J.M.Shannon, H.Ahmed.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.437-42.

The multiple-scan method of electron beam annealing has been used to activate shallow ($\text{Rp}<150\text{\AA}$), highly doped silicon layers produced by ion implantation of arsenic at 10 keV . Beam conditions have been optimised (600 W cm^{-2} for 100 ms) to produce essentially undiffused layers, as determined by high resolution SIMS, containing high concentrations of electrically active arsenic impurities. Computer modelling of diffusion effects in such layers has been used to identify optimum beam conditions and the calculations have been compared with experimental results. Hot electron device structures, which depend on negligible diffusion and high electrical activity, have been fabricated using the multiple-scan method with a peak annealing temperature of 900°C . (8 refs.)

114030 Pulsed electron beam annealing induced deep level defects in virgin silicon. D.Barbier (Lab. de Phys. de la Matière, INSA de Lyon, Villeurbanne, France), M.Kechouane, A.Chantre, A.Laugier.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.449-54.

DLTS has been used to investigate deep level defects induced by Pulsed Electron Beam Annealing (PEBA) in virgin (100) boron doped silicon. Various PEBA conditions were selected resulting in different molten layer thicknesses, melt front velocities and thermal gradient distributions. Discrete hole traps distributed in the regrowth layer were observed in all the annealed samples. The activation energies and thermal signatures of these levels do not correspond to already known defects except for one level which has been assigned to the carbon interstitial substitutional pair. Carbon contamination during irradiation is the most probable explanation for the creation of this defect. Other discrete hole trap levels are likely to be generated by quenching of the molten layer as far as their profiles do not extend beyond the regrowth layer. Moreover, a broad band of levels, characteristic of extended defects, has been observed only on the samples which have suffered the highest thermal stresses. This band of levels might be related to the generation of dislocation networks as recently observed by means of TEM on the same PEBA processed samples. (8 refs.)

114031 Growth of silicon-on-insulator films using a line-source electron beam. J.A.Knapp, S.T.Picraux (Sandia Nat. Labs., Albuquerque, NM, USA).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.557-62.

A swept line-source electron beam has been used to study unseeded Si-on-insulator crystallization at beam scan speeds of 150 – 1500 cm/s . For a particular sample configuration a maximum linear crystallization velocity of $\sim 350\text{ cm/s}$ was observed. At higher sweep speeds, competing nucleation occurred at intervals across the film. Both the limit in crystallization velocity and the intervals between nucleation are tentatively explained by a simple model. (9 refs.)

114032 Influence of alloy composition on defect production and recovery, in austenitic Fe-Cr-Ni solid solutions electron-irradiated at low temperature. O.Dimitrov, C.Dimitrov (Centre d'Etudes de Chimie Metall., CNRS, Vitry, France).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.656-9.

Austenitic Fe-16 wt.% Cr-20 to 45 wt.% Ni alloys have been studied by electrical resistivity measurements during 21K electron irradiation and during subsequent anneals. The Frenkel pair resistivity and the activation enthalpy for interstitial and vacancy migration have been evaluated in the 16-45 alloy. An increase in nickel concentration results in a strongly increased interstitial mobility and a slightly reduced vacancy mobility. The low swelling of the 16-45 alloy could be due to a lower vacancy formation energy. (9 refs.)

114033 Re-examination of the threshold energy surface in copper. W.E.King, R.Benedek, K.L.Merkle (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA), M.Meshi.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.789-94.

Radiation-induced defect production in copper has been studied using in-situ electrical resistivity damage-range measurements in the HVEM and molecular dynamics simulations. Analysis of the results yields a threshold energy surface characterized by two isolated pockets of low threshold energy centered at (100) and (110) surrounded by regions of much higher threshold energy; the corresponding damage function exhibits a plateau at 0.65 Frenkel pairs. A Frenkel pair resistivity of $(2.75\text{--}0.2^{+0.6})\times 10^{-4}\text{ }\Omega\cdot\text{cm}$ is proposed. A model damage function is constructed and compared to results from ion irradiation damage-rate measurements. (18 refs.)

114034 Differences in saturation of defects between electrons and reactor neutron irradiations at low temperature. M.Nakagawa (Res. Reactor Inst., Kyoto Univ., Osaka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.821-4.

The influence of the kind of irradiating particles on the defect saturation behavior in some FCC metals is surveyed by plotting the relative production rate versus the irradiation induced resistivity increment $\Delta\rho$. The largest spontaneous recombination volume was obtained for fission fragments, the next for neutron, and the smallest for electron irradiations, in the case of copper, and also similarly for aluminum and platinum. Comparative studies are made as well on the recovery characteristics after heavy irradiations by electrons or reactor neutrons at low temperature. (11 refs.)

114035 Low temperature irradiation of FeB amorphous alloys. A.Audouard (Lab. de Metall., CENS, Gif-sur-Yvette, France), J.C.Jousset.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.825-8.

21K 2.5 MeV electron irradiations induce localized defects in the short range order of the amorphous structure of FeB alloys. The idea which led to the results reported is the following: as in the comparatively well-known pure crystalline metal irradiation case, is it possible to define the elementary processes of the damage for an amorphous metallic alloy? If so, is it possible to characterize the 'defects' so created? The answer is thought to be positive. (12 refs.)

114036 On the evolution of microstructure during irradiation. R.Bullough (Theoretical Phys. Div., AERE, Harwell, England), T.M.Quigley.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.839-46.

The long range interaction fields between dislocations and point defects and between voids and point defects have been included, using the embedding procedure, to yield new sink strengths for these two sink types for use in the rate theory of radiation damage. These sink strengths have been used to interpret various electron irradiation observations of microstructural evolution. (25 refs.)

114037 Radiation damage in Zr and Ti. M.Griffiths, J.White, M.H.Loretto, R.E.Smallman (Dept. of Metall. & Materials, Univ. of Birmingham, Birmingham, England).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.880-2.

The nature of damage has been assessed in electron and proton irradiated Zr and Ti. In Zr loops of $b=1/3(1120)$, $1/3(1123)$ and $1/6(2023)$ have been observed. The loops of $b=1/3(1120)$ are found to be vacancy and interstitial. In Ti complex loops are found after electron irradiation and after proton irradiation defects which are found to be Fe-rich and which show vacancy type displacement contrast are observed. These results are discussed in terms of stress induced loop growth and impurity-defect interactions. (2 refs.)

114038 A study of irradiation damage in $\beta\text{Nb-3.1wt.\% Zr}$ alloy using a high voltage electron microscope. K.Nakai, Y.Muroo, K.Kinoshita, S.Kitajima (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.887-90.

The kinetic behavior of point defects in electron irradiated $\beta\text{Nb-3.1wt.\% Zr}$ has been examined at temperatures from 300 to 675K by use of a HVEM. Two kinds of impurities denoted with X and Y are concerned with the formation of complexes which act as nuclei of loops below 335K . Dissociation of X- and Y-complexes takes place in the regions 335 to 413K and 483 to 578K , respectively, resulting in a decrease in loop density with increasing temperature. Above 578K the impurities have no influence on the loop nucleation because of a high dissociation rate between interstitials and them. Migration energy of free interstitials and binding energies of X- and Y-impurities with interstitials are estimated to be $(3.36\pm 0.48)\times 10^{-20}\text{ J}$, $(7.24\pm 0.60)\times 10^{-20}\text{ J}$ and $(1.13\pm 0.10)\times 10^{-19}\text{ J}$, respectively. (12 refs.)

114039 Mechanism of void formation of iron and iron-alloys irradiated by electrons. E.Kuramoto, N.Yoshida, K.Kitajima (Res. Inst. for Appl. Mech., Kyushu Univ., Fukuoka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.899-902.

Analyses of void nucleation and growth in high-purity iron ($\text{RRR}_H 3500$) and iron alloys (Ti, Si and He) have been performed mainly for the results obtained from the electron irradiation in a high voltage electron microscope using a low vacancy migration energy (0.8 eV) in iron. (19 refs.)

- 114040 Influence of mechanical stresses on the accumulation of radiation defects in Nb and NbTi. L.S.Tophchyan (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.334-9 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- The combined effects of reactor radiation and mechanical stresses at low temperatures on the radiation-induced increase in the electrical resistivity of Nb and NbTi were studied. In the case of pure Nb a mechanical stress slowed down the rate of accumulation of radiation defects, whereas in the case of NbTi alloys it enhanced the radiation-induced increase in the electrical resistance. The processes which could account for these experimental results were considered. (25 refs.) A.T.
- 114041 Direct evidence for stress-enhanced swelling in type 316 stainless steel. D.L.Porter, M.L.Takata, E.L.Wood (Argonne Nat. Lab., Idaho Falls, ID, USA). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.272-6 (June 1983).
- Immersion density analysis of sections of Type 316 stainless steel tubes from He-pressurised in-reactor creep experiments has unequivocally demonstrated an enhancement of void swelling by an applied stress. In addition, the study has shown that in most cases of irradiation temperature and applied stress level, the void sizes and number densities are unaffected by stress at a given magnitude of swelling. Swelling versus irradiation dose relationships and microscopic examinations imply that the stress effect is to initiate swelling at a lower dose, while not affecting the nature of the mechanisms causing swelling. (12 refs.)

- 114042 A study of defect states in neutron-irradiated zirconium using positron annihilation spectroscopy. Carpenter G.J.C. (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada), H.T.Easterday, B.T.A.McKee. *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.277-86 (June 1983).
- Positron annihilation spectroscopy has been used to examine specimens of iodide-purity zirconium, irradiated with neutrons in the temperature range 355K to 725K. The mean positron lifetimes and Doppler broadening lineshape parameters from the irradiated specimens showed significant increases over values for annealed material. A two-component analysis of the lifetime spectra indicated saturation trapping at vacancies and dislocations for the lower irradiation temperatures. No evidence was found for the presence of trapped components with long lifetimes ($\tau \geq 300$ ps), indicative of three-dimensional vacancy clusters. Recovery of the 355K irradiation damage during annealing was interpreted in terms of the annihilation of vacancies at sinks (dislocations and grain boundaries) and recovery of the irradiation-induced dislocation structure. (39 refs.)

- Presents data about lattice expansion and broadening of the Bragg reflexions in Li_2O induced by thermal neutron irradiation. For the specimen irradiated to 1.44×10^{22} neutrons m^{-2} , the diffraction lines of the 422, 511 and 333 and 440 showed no striking shift compared to those of nonirradiated specimens. For the specimen irradiated to 2×10^{23} neutrons m^{-2} , the diffraction lines showed a drastic broadening and a considerable shift which corresponds to the 0.15% lattice expansion. (14 refs.)
- 114045 Critical radius for bias-driven swelling—a further analysis and its application to bimodal cavity size distributions. A.Hishinuma, L.K.Mansur (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *J. Nucl. Mater. (Netherlands)*, vol.118, no.1, p.91-9 (Aug. 1983).
- Cavities grow during irradiation only when the net vacancy influx caused by the dislocation-cavity bias is greater than the thermally emitted vacancy outflux. The cavity radius at which the strongly radius-dependent outflux equals the net influx has been termed the critical radius. An analysis is given for critical radius based on a derived expression containing functional dependences on gas pressure, dislocation and cavity capture efficiencies, temperature, and the other material and irradiation variables. Based on the solution of this equation a cavity stability diagram is obtained. The necessity for the development of a bimodal cavity distribution during irradiation after helium preinjection arises naturally from this construction. The dependence of critical radius on number of gas atoms, temperature, dose rate, and bias is illustrated for ranges of interest in the important variables. These results are consistent with recent experimental data. (14 refs.)

- Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.396-9
- Effect of solute atoms on the recovery of Cu, Ag and Ni after fast neutron irradiation at low temperature has been studied using electrical resistivity measurements. By doping with solute atoms, recovery stage I is suppressed and the substages are observed during stage II which is due to release of interstitial from trapping solute atom. The binding energies between solute atom and interstitial are estimated from the temperature of substage in recovery curves. The relation between the binding energies and the size effect is discussed. (12 refs.)

- Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.400-2
- By measuring the lattice parameters with X-ray techniques, the recovery process and the interaction between solute atoms and interstitials were investigated in fast neutron irradiated single crystals of Al and dilute Al-Ge alloys containing 0.2 and 1.1 at.% Ge. It was found that the change in the lattice parameter due to the neutron irradiation is proportional to the fluence. In the recovery curves of the Al-0.2 at.% Ge alloy obtained from (333) reflection, a remarkable suppression of recovery was found at stage I, and this suppression was released at the end of stage II. In the recovery curve obtained by the (400) reflection, a similar tendency was observed at stage I, while a small difference was found in a temperature range around 100K. These results were discussed in terms of the interaction between interstitials and impurities. (4 refs.)

- 114048 Direct determination of a radiation damage profile with atomic resolution in ion-irradiated platinum.** D.Pramanik (AMI, Santa Clara, CA, USA), D.N.Seidman.
Appl. Phys. Lett. (USA), vol.43, no.7, p.639-41 (1 Oct. 1983).
The field-ion microscope technique has been employed to determine directly a radiation damage profile, with atomic resolution, in a platinum specimen which had been irradiated at 60K with 20 keV Kr^+ ions to a fluence of $5 \times 10^{12} \text{ cm}^{-2}$. It is shown that the microscopic spatial vacancy distribution (radiation damage profile) is directly related to the elastically deposited energy profile. The experimentally constructed radiation damage profile is compared with a theoretical damage profile—calculated employing the transport of ions in matter (TRIM) Monte Carlo code—and excellent agreement is obtained between the two. Thus, it is demonstrated that it is possible to go directly from a microscopic spatial distribution of vacancies to a continuous radiation damage profile. (17 refs.)
- 114049 Flow behaviour of nickel irradiated with 15 MeV neutrons and 16 MeV protons.** R.H.Jones, E.R.Bradley, D.L.Styris (Pacific Northwest Lab., Richland, WA, USA).
J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.297-304 (June 1983).
The yield strength of zone refined nickel that was irradiated at 300K with T(d,n) and Be(d,n) neutrons and 16 MeV protons was found to increase by a similar amount when compared at equal fluence levels. A factor of 2.5 increase in the yield strength was determined for a 15 MeV neutron fluence of $1 \times 10^{22} \text{ m}^{-2}$ and a 16 MeV proton fluence of $2 \times 10^{22} \text{ m}^{-2}$. The strength increase was associated with defect clusters or small prismatic loops and could be described by a strong barrier model for both neutron and proton irradiated nickel. Serrated plastic deformation was observed for samples irradiated with 15 MeV neutrons and 16 MeV protons to fluences higher than $3 \times 10^{21} \text{ m}^{-2}$. The similarity in the hardening process of 15 MeV neutron and 16 MeV proton irradiated nickel is consistent with their damage energy cross sections being equal at high primary knock-on energies ($>10 \text{ keV}$). (25 refs.)
- 114050 Surface composition change of TiC under 0.15-3 keV hydrogen ion bombardment.** H.Tanaka, K.Saiki, S.Otani, A.Koma, S.Tanaka (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).
J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.317-20 (June 1983).
Reports the surface composition change in single crystal TiC, which is one of the candidate compound materials, under bombardment of high-density, hydrogen-ion beam. The results show that carbon atoms are highly depleted from the surface of TiC under bombardment of hydrogen ions in the energy range of 0.15-1 keV, which is the most probable energy range of fuel particles impacting the first wall in a fusion reactor. Therefore the problem of surface composition change becomes important for the characterization of TiC as the first wall material. (7 refs.)
- 114051 The effect of primary recoil spectrum on radiation induced segregation in nickel-silicon alloys.** R.S.Averback, L.E.Rehn, W.Wagner (Argonne Nat. Lab., Argonne, IL, USA), P.Ehrhart.
J. Nucl. Mater. (Netherlands), vol.118, no.1, p.83-90 (Aug. 1983).
Segregation of silicon to the surface of Ni-12.7 at.% Si alloys during 2.0-MeV He and 3.25-MeV Kr irradiations was measured using Rutherford backscattering spectrometry. For equal calculated defect production rates the Kr irradiation was $<3\%$ as efficient as the He irradiation for promoting segregation in the temperature range, 450-580°C. It was further observed that Kr preirradiation of specimens dramatically reduced segregation during subsequent He irradiation. A model for cascade annealing in Ni-Si alloys is presented which qualitatively explains the segregation results. The model assumes that small interstitial-atom-clusters form in individual cascades and that these clusters become trapped at silicon solute atoms. The vacancy thereby becomes the more mobile defect. The model should also have relevance for the observation that void swelling in nickel is suppressed by the addition of silicon solute. (26 refs.)
- 114052 Radiation-induced segregation in titanium alloys.** Z.Wang, G.Ayrault, H.Wiedersich (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
J. Nucl. Mater. (Netherlands), vol.118, no.1, p.109-14 (Aug. 1983).
Radiation-induced segregation (RIS) of V, Mo, Nb, Ta, Zr, and Sn in binary titanium alloys was investigated to test the solute size effect correlation in HCP alloys. Undersize Mo segregates weakly toward the sinks. Nb and Ta, which are slightly oversize in Ti, undergo little or no RIS. Oversize Zr solute in Ti segregates away from the sinks, whereas undersize Ti solute in Zr is enriched at sinks. All of these results are in accord with the solute size effect correlation. Surprisingly, Sn, which is significantly oversize in Ti, appears to segregate very little. The postirradiation annealing of Ti-3V and Ti-8Al-1V-1Mo confirmed that segregation of undersize V toward sinks is radiation-induced. Measurements of temperature and dose dependence in binary and complex alloys showed that the degree of V segregation has a maximum at $\sim 600^\circ\text{C}$ and obeys parabolic growth kinetics in its early stages but probably saturates at a rather low dose ($\sim 0.8 \text{ dpa}$). (8 refs.)
- 114053 Pattern formation in metallic glasses induced by helium ion implantation.** I.Lovas, T.Tel.
Report KFKI-1983-82, Hungarian Acad. Sci., Budapest (1983), 7 pp.
A model is constructed to explain the pattern formation. The migration of helium atoms is considered. The helium atoms are assumed to be in quasi free, in trapped, or in captured states. The density of the quasi free atoms and the energy density are governed by nonlinearly coupled diffusion type equations. The critical value of the control parameter and the critical wave-

number characterizing the soft-mode instability of the system are determined. Their orders of magnitude agree with that of the experimental data. Formally, the model can be reduced to the well-known Brusselator but the control parameter differs from that of the standard case. (11 refs.)

114054 Crystallization of amorphous silicon films by pulsed ion beam annealing. J.Gyulai, R.Fastow, K.Kavanagh, M.O.Thompson, C.J.Palmstrom, C.A.Hewett, J.W.Mayer (Dept. of Materials Sci., Cornell Univ., Ithaca, NY, USA).

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.455-60

Regrowth by pulsed proton beam was studied for evaporated amorphous Si layers, for layers converted to polycrystalline by annealing (both with and without Ge markers) and for implantation-amorphized SOS films. Silicon-on-sapphire showed the lowest threshold for regrowth. Amorphous silicon melted at about 0.2 J/cm^2 lower fluences of protons of 380 keV energy than crystalline Si. Implanted Sb into SOS occupies lattice positions exceeding the solid solubility. (4 refs.)

114055 Radiation damage in tantalum observed by PAC. A.Weidinger, M.Deicher, J.Busse (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.268-70

Stage III defects in Ta were investigated by the PAC method using ^{111}In as a radioactive probe. A unique defect configuration with $\nu_{Q1}=98(2) \text{ MHz}$, $\eta=0$ was found between 360K and 380K. In addition, unresolved signals from other defects with about twice the quadrupole interaction strength of ν_{Q1} were observed in the stage III region. If the sample was stored in air for a long period, a shift in the defect frequencies, probably due to interstitially dissolved impurities, was measured. (5 refs.)

114056 Displacement cascade damage in irradiated metals. B.L.Eyre, C.A.English (Metall. Div., AERE, Harwell, England).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.799-806

Results from electron microscope studies of vacancy clusters formed by the collapse of displacement cascades in heavy ion and neutron irradiated Cu, Mo and Fe are discussed. It is shown that the three metals exhibit considerable differences in cascade collapse behaviour although in each metal good agreement exists between the results obtained using heavy ion and neutron irradiation. (23 refs.)

114057 Direct observation of heavy radiation damage process by field ion microscopy. N.Igata, S.Sato, T.Sawai (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.811-14

Observed the point defects in heavily irradiated tungsten by field ion microscopy (FIM) and analysed surface radiation damage process from atomistic standpoints. The material used was a tungsten wire of 0.1 mm in diameter with a purity of 99.95%. The specimens were irradiated with various kinds of ions having energy 100~400 keV. The total dose was 0.01~10 dpa and the irradiation temperature was 20°C . The FIM observation was performed within (112), (121) and (211) planes for every atomic layer within the mean projected range. The calculated values from Lindhard's theory coincided with the observed damage depth profile within a factor of 2. The average size distribution was taken through the mean projected range. The maximum vacancy cluster size was 15 A, as caused by various kinds of ion irradiation. The total vacancy concentration was proportional to the square root of the total dose at 20°C irradiation. The total number of vacancies at the same level of average concentration of injected charged particles was proportional to the square root of the maximum primary knock-on energy. The annealing process was also investigated. (6 refs.)

114058 Radiation damage in glassy $\text{Pd}_{80}\text{Si}_{20}$ and $\text{Cu}_{50}\text{Zr}_{50}$. S.Klaumunzer, S.Rentzsch, G.Schumacher, G.Vogl (Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.829

Summary form only given. Different samples of the metallic glass $\text{Pd}_{80}\text{Si}_{20}$ were irradiated at 4.6K with 3 MeV-electrons and at 50K to 140K with high energy (25 MeV to 250 MeV) heavy ions (0, Ar, Kr). Care was taken to avoid implantation. Radiation-induced changes were monitored in situ by electrical resistance measurements and isochronal annealing treatments were performed up to 400K. The damage rate curves from electron irradiation of $\text{Pd}_{80}\text{Si}_{20}$ are very similar to those of pure metals. This similarity shows the existence of spontaneous recombination processes in metallic glasses. The saturation of the increase in resistivity is extrapolated to be about $2.45 \mu\Omega\text{cm}$. The authors conclude that the change in resistivity is proportional to the radiation-induced defect concentration. Similar effects are found after Ar- and Kr-irradiation of glassy $\text{Cu}_{50}\text{Zr}_{50}$ at about 60K to 120K. (2 refs.)

114059 Statistical theory of the evolution of damage structure under irradiation with cascades. K.Kitajima (Res. Inst. for Appl. Mech., Kyushu Univ., Fukuoka, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.847-52

A general statistical theory was presented for processes of cascade damage. Fluctuations of collisional and diffusional processes having wide range of relaxation times are approximated by a hierarchy of Fokker-Planck type equations. Methods of calculations are presented for transfer terms and applied for explanations of simulation irradiation studies made on metals. (18 refs.)

114060 The kinetics of the interaction between helium and displacement damage in irradiated materials. N.M.Ghoniem, S.Sharafat (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA), L.K.Mansur.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.865-8

Helium migration and clustering is affected by the presence of the primary damage components, vacancies and interstitials. A kinetic rate theory is developed to describe the migration, interaction and clustering of small helium-vacancy complexes. Numerical solutions of a set of rate equations are performed for transient as well as steady-state conditions. The study shows that helium migrates as an interstitial atom during early irradiation, turning gradually to a trapped helium mode by about a vacancy mean lifetime. At temperatures up to $\sim 550^\circ\text{C}$, helium migration in nickel irradiated in typical reactor conditions is primarily by a self interstitial replacement mechanism.

Self interstitials replace helium in substitutional sites and detrapp it into interstitial sites. The kinetics of cavity nucleation is investigated with particular emphasis on the kinetic stability of vacancy-helium complexes. (14 refs.)

114061 Voids and bubbles in argon irradiated nickel. S.Sasaki, M.Kiritani (Dept. of Material Phys., Osaka Univ., Osaka, Japan), A.Iwase, T.Iwata, F.E.Fujita.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.903-6

At the very beginning of energetic argon ion irradiation, interstitial type dislocation loops finish their nucleation, and then grow linearly with time. By continued irradiation, voids nucleate and grow without increasing their number density. Stereoscopic TEM observations of interstitial loops and voids show the distributions deeper and shallower than the ion stopping range respectively. Post-irradiation annealing experiment shows each void contains gas atoms depending on the depth from the ion-incident surface. All the observed processes of formation and annihilation of different types of defect clusters by irradiation and annealing are explained by using the diffusion kinetics of point defects. The influence of gas atoms on the formation of these defects are discussed. (1 ref.)

114062 Investigation of radiation induced impurity complexes in aluminium alloys by channeling. A critical analysis by computer simulation. M.Muller (Hahn-Meitner-Inst., KFA Berlin GmbH, Berlin, Germany).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.453-62 (1 Aug. 1983).

The flux distributions of channelled He^+ ions in Al and their development with penetration depth are calculated for the major axial and planar directions using Monte Carlo simulations. A strong depth oscillation of the flux in the channel centre is observed in the near surface region indicating the statistical nonequilibrium of the flux. The Monte Carlo program is applied to evaluate published yields measured in different directions ((100), (110), (111), [100], {111}) of He^+ irradiated Al alloys. It is shown that the solute atoms Mn, Cu, Zn, Ge and Ag which react with irradiation induced self-interstitials are displaced from their lattice site into the (100) or (111) direction. The distance of the displaced atoms to the octahedral interstitial site is found to be less than 0.1 nm. The displacement of the solute atom in the (100) direction agrees quite well with published analytically determined values. (35 refs.)

114063 A performance test of the recovery of single energy loss profiles via matrix analysis. P.Schattschneider (Inst. of Appl. & Tech. Phys., Tech. Univ. Vienna, Vienna, Austria).

Ultramicroscopy (Netherlands), vol.11, no.4, p.321-2 (1983).

From a hypothetical single scattering loss spectrum, revealing a broad plasmon and some unimportant structure, the multiple loss spectrum for a specimen thickness of three mean free path lengths was constructed. From the tests carried out up to now, it is concluded that the matrix approach is superior to the Fourier method with respect to the energy range afforded for the retrieval. Moreover, convergence of the procedure is guaranteed for any thickness parameter, contrary to the convolution approach which is the second well-established method. (3 refs.)

114064 Molar volumes and molar excess volumes of molten alkali chloride+silver chloride mixtures. A.Krekberg, W.Merkens, J.Richter (Inst. fur Phys. Chemie, RWTH Aachen, Aachen, Germany).

Z. Naturforsch. Teil A (Germany), vol.38A, no.8, p.890-2 (Aug. 1983).

Measurements of the densities (and with these of the molar volumes and the excess volumes) of the molten salt systems $\text{LiCl}+\text{AgCl}$, $\text{NaCl}+\text{AgCl}$, $\text{KCl}+\text{AgCl}$, $\text{RbCl}+\text{AgCl}$, and $\text{CsCl}+\text{AgCl}$ as functions of composition and temperature from the liquidus curve up to 1200K are reported. It is shown that a linear relation with the volume fraction fits the measured densities of the alkali chloride+silver chloride mixtures better than one with the mole fraction. (5 refs.)

114065 Measurements of densities and dielectric constants of liquid normal butane from 140 to 300K at pressures to 35 MPa. W.M.Haynes (Nat. Engng. Lab., NBS, Boulder, CO, USA).

J. Chem. Thermodyn. (GB), vol.15, no.9, p.801-5 (Sept. 1983).

Results of density and dielectric-constant measurements on compressed liquid normal butane at temperatures from 140 to 300K and pressures to 36 MPa are reported. Simultaneous measurements of these properties were carried out using a magnetic-suspension densimeter and a concentric-cylinder capacitor. Also presented are computed values of the Clausius-Mossotti function. (11 refs.)

114066 Viscoelastic relaxation in the acetamide+sodium thiocyanate binary system. G.Berchiesi, C.Vitali, P.Passamonti (Dipartimento di Sci. Chimiche, Camerino Univ., Camerino, Italy), R.Plowiec.

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.8, p.1257-63 (Aug. 1983).

The shear impedance, density and viscosity of the eutectic mixture $\text{NaCNS}+\text{CH}_3\text{CONH}_2$ have been measured in the temperature range 253-313K and at the frequencies 31 and 87 MHz. The real parts of the complex impedance and of the rigidity modulus have been obtained. The relaxation region is shifted in comparison with that of the Maxwell model and is interpreted using the modified BEL model. Irregularities in the real part of the mechanical impedance (around 283K) and in the Arrhenius plot of the viscosity (around 293K) may be attributed to changes in the liquid structure. (15 refs.)

114067 Elastic constants of some nematic liquid crystals with banana-shaped molecules. E.F.Gramsbergen, W.H.De Jeu (Solid State Phys. Lab., Groningen, Netherlands).

Phys. Lett. A (Netherlands), vol.97A, no.5, p.199-201 (29 Aug. 1983).

Results are given for the elastic constants in the nematic phase of some molecules with a curved (banana-like) molecular shape. In principle this could lead to a reduced bend elastic constant due to the possibility of adjusting to a bend deformation by a redistribution of the molecules. However, the elastic constants turn out to have quite normal values as compared with similar non-curved molecules. (10 refs.)

114068 Melt rheology of polymer blends: the morphology feedback. A.Plochocki (Polymer Engng. Dept., Univ. of Tennessee, Knoxville, TN, USA).

Polym. Eng. & Sci. (USA), vol.23, no.11, p.618-26 (mid-Aug. 1983).

Particular rheology compositions (PRC) so far observed for blends of polyolefins are confirmed with composition dependence of melt elasticity and viscosity functions for polypropylene/rubbers and blends of other commercial polymers. Particular morphology at PRC was indirectly ascertained from the composition dependence of specific volume, v_T -compositions for which the maximum v_T observed are those of minimum viscoelasticity. Direct evidence from scanning electron microscopy (SEM) indicates that the disperse morphology undergoes distinct change at PRC: from uniform into bimodal, with coarser core. Rubber rich mixtures display stratified texture confirming that the melt elasticity ratio (Van Oene's 1982) criterion for disperse/stratified morphology transition is valid in case of polypropylene/rubber blends. For a set of polymers of given melt elasticity ratios and at a composition ratio, static and rotational distributive mixers generate polyblends differing significantly in the melt rheology-morphology interaction. (43 refs.)

114069 Melt rheology of blends of semi-crystalline polymers. II. Dynamic properties of poly(ethylene terephthalate)-poly(amide-6,6) molten blends. L.A.Utracki, G.L.Bata (Industrial Materials Res. Inst., Nat. Res. Council of Canada, Montreal, Canada).

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.91-103

Melt rheology of poly(ethylene terephthalate), PET, poly(amide-6,6), PA, and their blends were investigated at 240, 260, 280 and 300°C on a Rheometrics Mechanical Spectrometer in a dynamic mode within the frequency range from 10^{-1} to 10^2 (rads/sec). Dynamic viscosity, storage and loss shear moduli were recorded. First, the isothermal rate of the overall thermal degradation process for each sample was determined, from which the activation energy of the process, E_p , as a function of the composition was computed. The rates of degradation as well as E_p s of the blends were found to be larger than those calculated from the properties of PET and PA by using an additivity rule. Next, subtracting the degradation effect from the recorded rheological signals, the true flowcurves result. The dynamic viscosity, η^* , and the dynamic measure of the primary normal stress difference coefficient, ψ^* , as functions

of the frequency, ω , were computed for each temperature, T , and composition, c . (23 refs.)

114070 Shear elastic constant softening in $(\text{V}_{1-x}\text{Cr}_x)_2\text{O}_3$: second-order nature of the low temperature phase transition. H.Yang, R.J.Sladek (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA), H.R.Harrison. *Solid State Commun. (USA)*, vol.47, no.12, p.955-7 (Sept. 1983). From ultrasonic wave velocities in semiconducting, corundum-structured $(\text{V}_{1-x}\text{Cr}_x)_2\text{O}_3$ with $x=0.015$ and 0.03 , the authors find that the C_{44} shear modulus softens drastically with decreasing temperature. Along with other elastic behavior this indicates a smooth change from rhombohedral to almost hexagonal elastic symmetry before a nearly second-order transition to the low T monoclinic phase. 62.20F Deformation and plasticity

(inc. yield, ductility and superplasticity; see also 81.40L Deformation, plasticity and creep)

114071 Interlayering and interlayer slip in biotite as seen by HRTEM. J.O.Banos, M.Amouric (Centre de Recherche sur les Mecanismes de la Croissance Cristalline, CNRS, Marseille, France), C.De Fouquet, A.Baronnet. *Am. Mineral. (USA)*, vol.68, no.7-8, p.754-8 (July-Aug. 1983). Interlayering, slip, and cleavage phenomena have been observed using high-resolution transmission electron microscopy in tectonically deformed biotite. The unit mica layers and the positions of the interlayer cations can be imaged

with this technique. From the observations, the authors conclude first that slip and cleavage occur in the interlayer level of the structure. The biotite shows partial interlayers of brucite-like sheets, which form, with the adjacent talc-like layers of the mica, single chlorite layers interstratified in the mica structure. From structural and physical considerations, brucite interlayering is interpreted here as a 'brucitization' of an interlayer level of the mica where partial slip or cleavage has previously occurred. It is an example of a chemical process at the atomic scale (local chloritization of the mica) favored by deformation microstructures. (19 refs.)

114072 Characteristics of plastic flow of interstitial phases. N.M.Vlasov, P.V.Zubarev. *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.361-5 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

An analysis was made of the experimental data on the high-temperature creep of interstitial phases on the basis of dislocation theory. The cubic dependence of the rate of creep on the stress is accounted for by a mechanism of plastic flow of interstitial phases in which the glide of a dislocation in the lattice of a metal is accompanied by diffusion jumps of nonmetal atoms. The nonmetal atoms do not follow the dislocation, in contrast to impurity atmospheres in solid solutions, but remain close to 'their' metal atoms and together with the latter they produce disordered regions near dislocation lines. (9 refs.) A.T.

114073 Modification of the theory of plastic flow based on a shear-strain mechanism. A.M.Kovrizhnykh. *J. Appl. Mech. & Tech. Phys. (USA)*, vol.23, no.6, p.860-5 (Nov-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.133-8 (Nov-Dec. 1982). [received: Sept. 1983]

An experimentally based modification of the theory of plastic flow is proposed, in which a macroscopic shear strain mechanism is taken as the basis for constructing the governing relationships. Such an approach does not use the concept of a loading surface to construct the governing relationships, but allows interpretation in this terminology. The loading surface is singular in the hardening stage, and comprised of piecewise-smooth sections of surfaces of constant principal tangential stresses. The appearance of plastic strain is associated with the Tresk-Saint-Venant plasticity condition, and hardening is developed as follows: the loading point in stress space displaces piecewise-smooth sections of the surfaces of constant principal tangential stresses parallel to themselves by withdrawing them from the origin. (9 refs.)

114074 The characteristic equation for superplastic flow. B.Burton (Technol. Planning & Res. Div., Berkeley Nuclear Labs., Berkeley, England). *Philos. Mag. A (GB)*, vol.48, no.3, p.L9-13 (Sept. 1983).

The characteristic-area concept of steady-state flow is applied to superplasticity. It is shown that the parametric dependence of flow rate upon stress and grain size is satisfied if it is assumed that an interface reaction controls the diffusion fluxes which lead to strain development. The characteristic area is shown to be equal to the produce of the grain diameter and the interfacial line-defect spacing. (9 refs.)

114075 Deformation of semibrittle solids. B.I.Koval'chuk (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1217-24 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.51-7 (Sept. 1982).

The author proposes a variant of the strain theory of plasticity of isotropic semibrittle solids for the case of simple loading. The effect of the first stress-tensor invariant on plastic flow and dilatation of the material is considered. (21 refs.)

114076 Laws of the limiting plasticity of metals. V.A.Skudnov (Gorky Polytech. Inst., Gorky, USSR). *Strength Mater. (USA)*, vol.14, no.9, p.1243-52 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.72-80 (Sept. 1982).

The author obtains a general phenomenological equation permitting theoretical analysis of the general and particular behaviour of the end point of the stress/strain curve and determination of the role of any parameter of interest, including defect parameters, in the kinetics of changes in the end point. (27 refs.)

114077 Photoplastic effects in II-VI crystals. S.Takeuchi, K.Maeda, K.Nakagawa (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.461-75

A reversible change in the flow stress with the illumination of a band gap light (photoplastic effect: PPE) is observed commonly in II-VI semiconducting compounds both with the zincblende and the wurtzite structures. After reviewing the experimental results accumulated so far concerning the usually observed PPE, detailed microscopic experiments on CdTe (partly on CdS) single crystals are described. In-situ TEM straining experiments with a laser illumination system clarified that the dislocation mobility, evidently controlled by the Peierls mechanism, is not affected by light illumination. The investigation of the dislocation glide behavior over a longer range using the etch pit method and the cathodoluminescence microscopy with a SEM revealed that the dislocations are apt to become immobilized after traveling a certain distance from the sources with a high velocity. The dislocation loops and cusps observed by TEM suggest that the immobilization is caused by jog formation along screw segments. (29 refs.)

62.20H Creep

(see also 81.40L Deformation, plasticity and creep)

114078 Creep of weakly strained LiF crystals in the temperature range 1.6-300K. H.-J.Kaufmann, S.V.Lubenets, V.V.Abraimov (Physicotech. Inst. for Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.181-4 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.321 (Feb. 1983). [received: Sept. 1983]

At the initial stage of plastic deformation the creep of LiF crystals was shown to be described by the logarithmic relation $y = a \ln(vt + 1)$. The coefficient *a* decreases with decreasing temperature in the neighbourhood of 300K and for $T < 10\text{K}$, but remains practically constant over the wide range from 150 to 10K. An analysis of the temperature dependence of the flow stress $\tau_0(T)$ and the activation volume $V(T)$ suggests that the creep is due to thermal activation determined by the interaction of dislocation with local lattice defects. At liquid-helium temperatures, the Peierls barriers may have an effect on the mobility of dislocations. The distinctive features of the dependences $\tau_0(T)$ and $V(T)$ in the range 100-200K can be related to the formation of an ordered atmosphere of impurity defects in the elastic field of mobile dislocations (induced Snoek effect). No influence of quantum properties of the dislocation on the creep of LiF crystals was observed. (33 refs.)

62.20M Fatigue, brittleness, fracture, and cracks

(inc. hardness; see also 81.40N Fatigue, embrittlement and fracture)

114079 Microhardness of rhombohedral crystals: Calcite and sodium nitrate. J.R.Pandya, L.J.Bhagia, A.J.Shah (Dept. of Appl. Phys., M.S. Univ. of Baroda, Baroda, India). *Bull. Mater. Sci. (India)*, vol.5, no.1, p.79-82 (March 1983). [received: Sept. 1983]

The variation of hardness of rhombohedral single crystals of calcite and sodium nitrate with quenching temperature is studied. Vickers and Knoop hardness numbers are determined from the indentations produced on freshly-cleaved crystal surfaces for various loads. The variation of hardness number with quenching temperature can be represented by $HT_k^k = \text{constant}$ where the exponent k is less than unity and its sign determines the nature of material. (6 refs.)

114080 Parameters of mechanical twins emitted by a crack. A.P.Korolev, V.A.Fedorov (Inst. of Chem. Machine Construction, Tambov, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.390-2 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* Coarse-grained samples of Fe+3.25% Si were subjected to dynamic stretching along the [001] axis at temperatures in the range 77-273K. The density and dimensions of twins emitted by rapidly travelling cracks were determined after fracture for regions where the crack velocity was known. Changes in the test conditions, such as a preliminary deformation by slip, increased considerably the frequency of appearance of twins which accompanied the dynamic propagation of cracks. Such active control of the parameters of the concomitant twins altered considerably the mechanism and kinetics of fracture. (6 refs.) A.T.

114081 A method of creep damage summation based on accumulated strain for the assessment of creep-fatigue endurance. R.Hales (Berkeley Nuclear Labs., CEBG, Berkeley, England). *Fatigue Eng. Mater. & Struct. (GB)*, vol.6, no.2, p.121-35 (1983). A method of combining long term creep data with relatively short term mechanical behaviour to provide an estimate of creep-fatigue endurance is presented. It is proposed that the creep-fatigue effect in high temperature cyclic deformation is governed by a difference in strain rate around the cycle and the associated variation in ductility with strain rate. (21 refs.)

114082 Investigation of material damage under creep and creep strength. A.M.Lokoshchenko. *J. Appl. Mech. & Tech. Phys. (USA)*, vol.23, no.6, p.855-9 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.129-33 (Nov.-Dec. 1982). [received: Sept. 1983] The author presents results of an experimental investigation of $\omega(t)$, the measure of material damage in creep. The rupture time $t=t^*$ is the time at which the damage reaches unit [$\omega^*=\omega(t^*)=1$]. It is shown that $\omega^*<1$, where the dependence of ω^* on stress is monotonically decreasing in nature; an analytic description of this effect is obtained. The specimens were various Cu rods. (4 refs.)

114083 Conditions for cavity growth during slow-fast fatigue. W.Beere (Berkeley Nuclear Labs., CEBG, Berkeley, England). *Met. Sci. (GB)*, vol.17, no.4, p.187-91 (April 1983). [received: Sept. 1983] The growth rates of grain boundary cavities during slow-fast fatigue are calculated by assessing the rates of four growth mechanisms. It is shown that cavity growth can take place providing the strain rate during tension is below a critical value. Also at sufficiently low strain rates cavities can grow to a large size before the life of a fast-fast test is achieved. The author suggests that a better understanding of cavity nucleation is desirable. (14 refs.)

114084 The transition from an emitting to a cleaving crack. I.-H.Lin (Fracture & Deformation Div., NBS, Boulder, CO, USA), R.Thomson. *Scr. Metall. (USA)*, vol.17, no.8, p.1031-4 (Aug. 1983). Proposes two mechanisms by which a crack, able to produce dislocations either from its own tip or from external sources, with increasing external stress intensity will undergo a transition to cleavage after a critical dislocation shielding charge has built up. (3 refs.)

114085 Dislocation emission from cracks in the presence of liquids. I.-H.Lin (Fracture & Deformation Div., NBS, Boulder, CO, USA), R.Thomson. *Scr. Metall. (USA)*, vol.17, no.8, p.1035-7 (Aug. 1983). Presents a mechanism by which a wetting liquid can modify the emission criterion at the tip, and discusses the requirements for embrittlement. There are three general prototype models for mode I fracture: (1) cleavage in which bonds are pulled apart in tension by the stress concentration at the tip; (2) crack growth by dislocation slide-off at the crack-tip; (3) fully ductile crack growth by hole nucleation ahead of the crack. It is shown that possibilities exist for mechanism transitions from type 3 to type 1 and from type 3 to type 2 when liquid metal is introduced. (10 refs.)

114086 The breaking of polycrystalline ice. V.P.Epifanov (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1063-5 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1364-7 (Dec. 1982). [received: Sept. 1983]

The breaking of ice during uniaxial compression was investigated by means of a procedure for the comprehensive determination of the mechanical characteristics of a deformable material. The longitudinal and transverse deformations, and the amplitude and time of the passage of an elastic disturbance through the specimen, were measured synchronously, and the amplitudes and spectra of acoustic-emission signals, the load, and the temperature were recorded. The frequency of transmission of the sounding pulse was varied from 0.6 MHz to 6 MHz. The attenuation coefficient α and the propagation speed v of an acoustic disturbance were determined by the pulse-phase method. (8 refs.)

114087 Evaluating the durability of materials on the basis of thermal fluctuation theory. E.S.Pereverzev (Inst. of Engng. Mech., Acad. of Sci., Dnepropetrovsk, USSR).

Strength Mater. (USA), vol.14, no.11, p.1477-82 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.48-51 (Nov. 1982). [received: Sept. 1983]

The kinetics of brittle fracture of a specimen are examined for the case when thermal fluctuation processes caused by the oscillatory motion of atoms play the deciding role in the fracture process. In the case of fracture, the rupture and restoration of interatomic bonds represent a thermal fluctuation process. Only the rupture of interatomic bonds is examined. (13 refs.)

114088 Deformation and fracture of a material in plane stress under complex loading. N.S.Mozharovskii, K.N.Rudakov, A.A.Zakhovai (Kiev Polytech. Inst., Kiev, Ukrainian SSR).

Sov. Appl. Mech. (USA), vol.18, no.12, p.1092-6 (Dec. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.12, p.54-8 (Dec. 1982). [received: Sept. 1983]

Cyclic loading according to complex paths may lower the load-carrying capacity of materials compared to simple (proportional) loading. In particular, in the cyclic loading of tubular specimens of steel there was an intensification of creep and fracture. The authors present the basic results of studies undertaken to explain the reasons for this intensification. In connection with the fact that the unloading is elastic, the authors compared results obtained with active loading. It was assumed that the effects of complex loading are the reasons for the intensification of creep and fracture, and that the effect of complex loading on strain and load-carrying capacity should also be manifest in one-time loading. 62.30 MECHANICAL AND ELASTIC WAVES
(see also 03.40K Mathematical aspects)

114089 Analysis of the elasticoelectric effect. V.A.Shkitin, N.V.Pereloma, L.E.Chirkov (Inst. of Steel & Alloys, Moscow, USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.1, p.5-7 (Jan.-Feb. 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.1, p.14-17 (Jan.-Feb. 1983). [received: Sept. 1983]

General equations are derived representing the variation of the elastic-wave displacement and phase-velocity vectors in the case of the elasticoelectric effect in an anisotropic medium of arbitrary symmetry. Conditions formulated and expressions derived for determining the directions of maximum change of the elastic-wave phase velocities in the case of arbitrary orientation of the wave normal and electric field, and also of the transverse elasticoelectric effect. (7 refs.)

114090 Leaky elastic waves in hexagonal crystals. V.I.Al'shits, V.N.Lyubimov (Inst. of Crystallography, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.130-5 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.224-33 (March-April 1983). [received: Sept. 1983]

The authors investigate types of leaky elastic waves arising in the vicinity of a transversely isotropic direction in a semiinfinite hexagonal crystal with a surface parallel to the hexad symmetry axis. They show that in addition to the known class of leaky pseudosurface waves, which pass over to the usual Rayleigh surface wave for a transversely isotropic direction, there are two new types of leaky waves, which for symmetrical orientation correspond to Brewster reflections and to the transverse body wave. The authors indicate the ranges of values of the elastic constants of the crystal for which leaky waves of various types arise. (14 refs.)

114091 Method of obtaining dispersion equation for normal and surface waves in layered anisotropic systems. V.V.Filippov (Inst. of Phys., Acad. of Sci., Belorussian SSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.136-9 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.234-9 (March-April 1983). [received: Sept. 1983]

Dispersion equations for normal and surface waves in plane-layer systems are obtained from the condition that the reflection coefficient of the system becomes infinite. General dispersion equations are derived for the cases in which the surface or normal waves are bipartial or tripartial. For systems containing intensifying layers, the conditions for the existence of surface or normal waves coincide with the condition of self-excitation of such a system. (8 refs.)

62.40 ANELASTICITY, INTERNAL FRICTION, AND DAMPING
(see also 81.40J Elasticity and anelasticity)

114092 Zener relaxation in copper-indium-aluminium alloys. I.M.Sharshakov, V.V.Putilin (Polytech. Inst., Voronezh, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.406-8 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

The internal friction was determined for alloys with the same amounts of indium and aluminium (from 10 to 20 at.%) but different amounts of copper (from 80 to 60 at.%). The dependence of the amplitude of the Zener internal friction peak on the copper concentration indicated that the relaxation process was dominated by copper-aluminium pairs of atoms. (6 refs.) A.T.

62.50 HIGH-PRESSURE AND SHOCK-WAVE EFFECTS IN SOLIDS

114093 Shock compression of zirconia ZrO₂ and zircon ZrSiO₄ in the pressure range up to 150 GPa. T.Mashimo (Faculty of Engng., Kumamoto Univ., Kumamoto, Japan), K.Nagayama, A.Sawaoka. *Phys. & Chem. Miner. (Germany)*, vol.9, no.6, p.237-47 (1983).

The shock compression state of zirconia ZrO₂ and zircon ZrSiO₄ in the pressure range up to 150 GPa (1.5 Mbar) are studied on the basis of the measurements of shock velocities, particle-velocity histories, free surface motions, and electrical conductivities. Zircon transforms, and zirconia probably does, to high pressure phases up to 90 GPa. The shock velocity (U_s)-particle velocity (U_p) Hugoniot can be described as $U_s=4.38+1.37 U_p$ km/s above 90 GPa for ZrO₂, and $U_s=6.50+0.49 U_p$ km/s (mixed phase region), and $U_s=1.54+2.30 U_p$ km/s (high pressure phase region) for ZrSiO₄. The corrected isothermal densities of the high pressure phase ZrSiO₄ are roughly consistent with the isothermal ones of mixtures of ZrO₂ and SiO₂. Bulk sound velocities in the high-pressure phase region of these oxides are discussed in comparison with other oxides. Electrical conductivities of these oxides increase from lower than 10⁻¹² S/m to greater than 10⁰ S/m in the shock-stress range up to 70 GPa, and remain as constant values up to higher than 100 GPa. (57 refs.)

114094 Shock effects in MgAl₂O₄-spinel. H.Schafer (Inst. fur Mineralogie, Tech. Hochschule Darmstadt, Darmstadt, Germany), W.F.Muller, U.Hornemann. *Phys. & Chem. Miner. (Germany)*, vol.9, no.6, p.248-52 (1983).

Shock recovery experiments on synthetic MgAl₂O₄-spinel samples in the pressure range 25.5 to 50.5 GPa have been performed in order to examine the effects of shock waves on this material. The shocked samples were subsequently studied in the transmission electron microscope. All samples showed shock-induced dislocations with the Burgers vector 1/2 {110} and twin lamellae of the twin-law {111}. In addition, samples, which had experienced the higher pressures, showed lamellar areas of a crystalline phase that the authors have not yet been able fully to characterize. It is probably not ϵ -MgAl₂O₄. (27 refs.)

114095 Acoustic properties of cadmium pyroniobate single crystal. N.K.Yushin, A.N.Nasyrov, F.M.Salaev, E.S.Sher (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.326-7 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.575-7 (Feb. 1983). [received: Sept. 1983]

The authors investigate the acoustic properties of a cadmium pyroniobate single crystal. Single crystals of Cd₂Nb₂O₇ were grown by the method of a solution in a melt. The geometry of the specimen allowed measurements to be made only for elastic waves propagating along the [110] direction (in the axes of the cubic phase at 300K). Elastic waves were excited by a lithium niobate piezoelectric transducer. The velocity of propagation V of the elastic waves was measured at a frequency of 30 MHz by the pulse interference method. (19 refs.)

114096 Acoustic characteristics of porous bronze. S.V.Belov, A.S.Terekhin, S.K.Balantsev, P.A.Vityaz', V.M.Kaptevich, V.K.Shelyag (N.E. Bauman Moscow High Tech. Coll., Moscow, USSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.20-3 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.22-5 (Jan. 1983). [received: Aug. 1983]

It is shown that sound absorption by porous bronze is influenced by the specimen thickness and pore size and also by the size of the gap between the specimen and a rigid bottom. The highest values of coefficient of sound absorption α (0.9-0.95) in a wide sound frequency range were attained with 8- to 10-mm-thick specimens having pores of 100- to 200- μ m size. By varying the size of the gap between the specimen and a rigid bottom it is possible to vary the position of the sound absorption coefficient maximum on the frequency scale without affecting its absolute value. There was good agreement between values of specific resistance to blowing through obtained as a result

of acoustic and hydraulic tests. It is therefore possible to predict the acoustic properties of porous metals from data yielded by hydraulic tests and vice versa. (3 refs.)

62.80 ULTRASONIC RELAXATION

(see also 74.30G Ultrasonic attenuation in superconductors, 43.35 Ultrasonics)

114097 Ultrasonic and hypersonic investigations of structural relaxation in aqueous solutions of hexamethylphosphortriamide. P.Miecznik (Mickiewicz Univ., Poznan, Poland). *Arch. Acoust. (Poland)*, vol.8, no.1, p.55-68 (1983). Measurements of the absorption coefficient of ultrasonic waves in the frequency range 10-100 MHz and of the propagation velocity of ultra- and hypersonic waves in aqueous solutions of hexamethylphosphortriamide (HMPT) were carried out. In addition the density of the solutions and the coefficient of shear viscosity was measured. On the basis of the quantities measured, the coefficient of bulk viscosity, relaxation parameters of the process observed and, on the basis of the theory of compressibility relaxation, change in free energy and volume between two structural states were measured. The analysis of the results of measurements of the absorption coefficient of ultrasonic waves, depending on the frequency, temperature, and composition of solutions, shows the presence in aqueous solutions of HMPT of a relaxation process related to the formation and disintegration of clathrate structures with the composition HMPT.17 H₂O. On the basis of compressibility relaxation theory, it was shown that the process of structural relaxation is related to a change in volume ΔV and in free energy ΔF between two structural states. (15 refs.)

63.00 LATTICE DYNAMICS AND CRYSTAL STATISTICS

(see also 05.50 Lattice theory, 65. Thermal properties, 66.70 Thermal conduction, 68.30 Dynamics of surface and interface vibrations, 78.30 Infrared and Raman spectra)

63.20 PHONONS AND VIBRATIONS IN CRYSTAL LATTICES

114098 Force constant model of crystalline HI in its low temperature phase. Chia-Nan Chang (Dept. of Electronic Engng. & Technol., Nat. Taiwan Inst. of Technol., Taipei, Taiwan), Wan-Sun Tse. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.54-8 (Dec. 1982). [received: Sept. 1983] Lattice dynamics of crystalline HI in phase III is studied by using the Born-Von Karman force constant model with five different kinds of interatomic force constants and the results are compared to observed zone centre ($k=0$) frequencies (Raman and IR). (9 refs.)

114099 Lattice vibrations of solid hydrofluoric acid. Wan-Sun Tse (Inst. of Phys., Acad. Sinica, Taipei, Taiwan), Chia-Nan Chang. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.59-66 (Dec. 1982). [received: Sept. 1983] Lattice dynamics calculations on the solid hydrofluoric acid are presented. It is found that six interatomic force constants using the Born-Von Karman model are capable of giving acceptable values of the zone center frequencies. (10 refs.)

114100 Lattice dynamics of the hydrogen halide crystals. Chia-Nan Chang (Dept. of Electronic Engng. & Technol., Nat. Taiwan Inst. of Technol., Taipei, Taiwan), Wan-Sun Tse, Li Chang. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.67-76 (Dec. 1982). [received: Sept. 1983] A lattice dynamical model for three of the four hydrogen halide molecular crystals in their low temperature phase III has been investigated by using the Born-Von Karman model with different interatomic force constants and the results are compared to observed zone centre ($k=0$) frequencies (Raman). This simple model is also used to estimate hydrogen bond strengths in different crystals. (9 refs.)

114101 Properties of solid potassium cyanide: is the physics of cyanide crystals really chemistry?. M.L.Klein (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada), I.R.McDonald. *J. Chem. Phys. (USA)*, vol.79, no.5, p.2333-42 (1 Sept. 1983). Molecular dynamics simulations are reported for the orientationally disordered phase I of solid potassium cyanide. The calculations are based on an ionic potential incorporating a charge distribution for the cyanide ion which gives realistic values for the electrostatic moments up to and including the hexadecapole. Semiquantitative agreement with experiment is obtained for a wide range of static and dynamic properties of the crystal. Comparison with results obtained earlier for simple electrostatic models shows that the high order moments are an essential ingredient of a satisfactory potential. (31 refs.)

114102 Lattice dynamics of solid I₂ under high pressure. K.Kobashi, R.D.Eiters (Phys. Dept., Colorado State Univ., Fort Collins, CO, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.3018-25 (15 Sept. 1983).

A calculation of the lattice dynamics of solid I₂ is made on the basis of a semiphenomenological potential with terms describing the intramolecular interaction, orientation-dependent charge transfer interactions, and nonbonding interactions. In addition, two terms describing a coupling between intramolecular vibrations of different molecules and a vibrational coupling between charge transferred bonds are included. At normal pressure, calculated vibrational frequencies are in good agreement with Raman and neutron scattering data. Agreement with experiment at high pressures requires that some potential parameters be volume dependent, and the implication of this result to the pressure induced changes in the electronic states of solid I₂ is discussed. The merging of the intramolecular A_g and B_{3g} Raman bands upon compression is explained quantitatively. The pressure dependence of several lattice vibrational mode frequencies are predicted but the observed softening of the librational A_g mode is not reproduced. The crystal energy is also calculated and compared with experiment. (27 refs.)

114103 The parameterization of vibronic transitions for lanthanide and actinide ions in crystals. R.A.Satten (Dept. of Phys., Univ. of California, Los Angeles, CA, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.235 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given, as follows. Some of the problems associated with parameterizing vibronic transitions of lanthanide and actinide ions in crystals and interpreting the results are discussed. Much of the discussion is centered on the vibronic intensity parametrization of the UCl_6^{2-} complex in crystals. (no refs.)

114104 Low frequency lattice vibrations of LaF₃ by neutron scattering. G.S.Dixon (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA), R.M.Nicklow. *Solid State Commun. (USA)*, vol.47, no.11, p.877-9 (Sept. 1983).

The phonon modes having frequencies less than 3 THz in the high symmetry directions of LaF₃ are reported. These are compared to the results of previous optical studies. A previously unobserved branch of low group velocity is found near 1.2 THz polarized both parallel and perpendicular to the basal plane. Its significance for the lifetimes of zone boundary acoustic phonons is discussed. (19 refs.)

63.20D Phonon states and bands, normal modes, and phonon dispersion

114105 Harmonics of phonons in Al. Y.Nakai, Y.Tsunoda (Faculty of Sci., Osaka Univ., Osaka, Japan). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.286-90 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

According to the Toda theory (1967) for a one-dimensional exponential lattice, the lattice vibrations have higher harmonics without damping in time. This is contrasted to phonons with a finite life-time obtained by the perturbation theory in the pseudoharmonic approximation. A search for the higher harmonics in the phonons of Al was carried out by means of inelastic scattering of neutrons. Neutron groups observed at elevated temperatures are explained as the second harmonic wave expected for the Toda lattice although other explanations cannot be excluded. (5 refs.)

114106 Coupling of longitudinal phonons with transverse Einstein mode in C₂₄Rb. S.Funahashi, T.Kondow, M.Iizumi (Div. of Phys., JAERI, Ibaraki-ken, Japan). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.305-9 (May 1983).

(Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). Phonon dispersion relations in C₂₄Rb made from HOPG were measured at 30, 80 and 120K. Three L mode phonon branches were observed for $q||c^*$ axis. A small gap was discovered at $\hbar\omega \approx 5$ meV on the acoustic branch. Except for this gap region, the dispersion curves were explained in terms of the one-dimensional Born-von Karman model. Three interlayer force constants were evaluated. The nearest neighbour (NN) carbon-carbon force is nearly

equal to that of pristine graphite. The NN carbon-rubidium force agrees with Dresselhaus's empirical law. The second neighbour carbon-carbon force across rubidium layer is 12% that of the first neighbour force but cannot be ignored. The small gap in the acoustic branch is satisfactorily explained as a result of coupling with transverse Einstein oscillations predicted by Suganuma et al. (1981) from low temperature specific heat measurements. An appreciable change in the results at the three temperatures was not observed. (7 refs.)

114107 Coupled quadrupole-phonon excitations: inelastic neutron scattering on Van Vleck paramagnet PrNi₂. V.L.Aksenov, E.A.Goremychkin, E.Muhle (Joint Inst. for Nuclear Res., Dubna, USSR), Th.Frauenheim, W.Buhrer. *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.310-13 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). Inelastic neutron scattering experiments on a single crystal of PrNi₂ (0.4 cm³) were performed at the sample temperature T=8K. The dispersion relations of the acoustic transverse phonons and the low energy magnetic excitations were measured in the T and Δ-directions. An analysis of the intersection region of these excitations shows that an additional neutron intensity to the nuclear and magnetic dipolar scattering occurs due to magnetoelastic scattering. The hybridised spectra of phonons and quadrupole excitons are discussed. (5 refs.)

114108 Calculation of the phonon width and phonon shifts in naphthalene-d₈. V.K.Jindal, J.Kalus (Phys. Inst., Univ. Bayreuth, Bayreuth, Germany). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.314-16 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). The width Γ and the shift Δ of the q=(0, 0, 0) phonon at 2.52 THz were calculated with three different sets for the forces of a 6-exp-potential. The molecules were assumed to be rigid. The authors took into account cubic and quartic anharmonicity terms. The three models differ in magnitude for Γ and Δ by about 25%. A comparison is made with inelastic neutron scattering data. (10 refs.)

114109 Lattice dynamics of FePt alloys of AB₂ type ordered structure. Y.Noda, Y.Endoh (Dept. of Phys., Tohoku Univ., Sendai, Japan), S.Katano, M.Iizumi. *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.317-22 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). The lattice dynamics of FePt alloys with the Cu₃Au type crystal structure, Fe₃Pt and FePt₃, have been studied by inelastic neutron scattering. The phonon dispersion curves along the [100], [110] and [111] directions have been observed over the whole Brillouin zone at room temperature. The observed phonon energies of acoustic modes of Fe₃Pt are almost the same as those of FePt₃ except the [110]TA₁ branch, although the average atomic mass is different by a factor of 1.8. The dispersion relations have been analysed by the Born-von Karman (BvK) force constant model where the first two neighbour forces were employed. It turns out that the nearest neighbour Fe-Fe force constant (1xx) is unusually small in the ferromagnetic Fe₃Pt Invar alloy. (10 refs.)

114110 Gitterdynamik von Imidazol (Lattice dynamics of Imidazol). K.H.Link. **Report JUL-1850**, Kernforschungsanlage, Julich, Germany (May 1983), 125 pp. In German. The lattice dynamics of imidazole have been investigated. To this end dispersion curves have been determined at 10K by inelastic coherent neutron scattering. Strictly speaking, of the 24 expected external curves 22 were measured along the symmetry directions (100) and (001) and ten branches along (010). Raman measurements have been done to investigate Γ-point modes. The combination of extinction rules for Raman and neutron scattering leads to the symmetry assignment of Γ-point modes. The experiment yields a force constant for the stretching vibration of the hydrogen bond of 0.33 mdyn/Å. A force model has been developed to describe the intermolecular atom-atom interactions in imidazole. In a minimisation routine the open parameters of the force model have been fitted to the observed dispersion branches. The force model contains the van der Waals, the exchange interaction and the interactions of static monopoles and dipoles. These static multipoles take into account the differences of the electronegativities within the molecule and its asymmetric shape. An essential part of the hydrogen bond is provided by the static multipole interaction. (47 refs.)

114111 Spectroscopic properties and relaxation processes of impurity molecules in solids. II. Vibrational relaxations. H.Kono, S.H.Lin (Dept. of Chem., Arizona State Univ., Tempe, AZ, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2748-55 (15 Sept. 1983). For pt.I see *ibid.*, vol.78, no.5, p.2607 (1983). The authors have calculated the vibrational relaxation rates for HCl (DCI)/Ar matrix systems. The quantitative agreement between their calculations and experimental data is fairly good. Their approach based on the adiabatic approximation can consistently treat the eigenvalue problems and vibrational relaxation processes for diatomic molecules embedded in monatomic crystals. The adiabatic approximation is used to separate high (intramolecular vibration) and low frequency modes (molecular rotation and lattice vibration). The nonadiabatic couplings (the kinetic energy operators for the low frequency modes) induce the vibrational relaxation processes. Their numerical calculations support the mechanism proposed by Bondybey and Brus (1980) that for small hydrides molecular rotation is the dominant accepting mode. The A_{1g} totally symmetric lattice modes in the classification by the irreducible representations of the substitutional site symmetry O_h are shown to be dominant to accept the energy mismatch between initial and final rotational levels. For the DCI/Ar system, they have found that the mixing of initial rotational levels due to the rotation-lattice vibration coupling is responsible for the vibrational relaxation. The calculated relaxation rate for DCI is smaller than that of HCl by one order of magnitude. (35 refs.)

114112 Local optical oscillations near point and extended defects in ionic crystals. A.M.Kosevich (Physicotech. Inst. for Low Temperatures, Acad. of Sci., Ukrainian SSR), V.A.Pogrebnyak. *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1090-4 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1886-93 (Nov. 1982). [received: Sept. 1983] It is shown that the vector-like field of the relative displacements of the ions in the unit cell during optical oscillations of an ionic crystal leads to a nonexponential (power-law) decrease of the amplitude of the local optical oscillations at large distances from point and linear defects. In the case of a planar defect the amplitude decreases exponentially over a macroscopic distance equal to the wavelength. The dispersion laws of oscillations localized near linear and planar defects are obtained. (13 refs.)

63.50 VIBRATIONAL STATES IN DISORDERED SYSTEMS

114113 Effect of amorphous sequences on the longitudinal acoustic modes in partially crystalline polymers. I. Transfer matrix method. G.R.Strobl (Fachbereich Chem., Inst. for Phys. Chem., Johannes-Gutenberg-Univ., Mainz, Germany). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.8, p.1357-80 (Aug. 1983). A novel theoretical scheme is developed which enables the determination of the LAM-like vibrations of polymer chains made up of crystalline and amorphous parts as they occur in partially crystalline structures. The boundary conditions effective at the junction points are formulated in terms of the compliances of the associated amorphous sequences. These compliances can be derived from their eigenfrequencies and eigenvectors in a disconnected state. The treatment uses a matrix formalism which can be extended to include bending and torsional motions in a general state of vibration of the crystalline stem. A first numerical example demonstrates that the LA mode of a crystalline stem can be strongly perturbed by the coupling to the adjacent amorphous sequences. Interpretation of frequencies and line shapes of observed LA modes should always include these coupling effects; their neglect can lead to considerable errors. (14 refs.)

114114 Inelastic scattering of polarised neutrons by amorphous Fe₄C₇₀Si₁₅B₁₀. D.E.G.Williams, K.R.A.Ziebeck (Dept. of Phys., Loughborough Univ. of Technol., Loughborough, England). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.367-72 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). The inelastic scattering of polarised neutrons has been used to investigate the possible existence of magnetic excitations in the amorphous alloy Fe₄C₇₀Si₁₅B₁₀. The measurements were confined to wave vectors close to 3.18 Å⁻¹ which corresponded to the position of the first peak in the static structure factor. Extensive scans both in wave vector and in energy revealed several features but only one of these was found to be an intrinsic excitation of the system. This mode, which was extremely weak was non-magnetic and was found to disperse with a sound velocity of 1636 m s⁻¹. (9 refs.)

114115 Resonant photon scattering in metallic glasses. N.Thomas (Dept. of Phys., Univ. of Birmingham, Birmingham, England). *Philos. Mag. B (GB)*, vol.48, no.3, p.297-305 (Sept. 1983). The two-level systems (TLS) in metallic glasses at low temperatures are so heavily damped by inelastic electron scattering that one cannot realistically describe the resonant absorption of phonons by these systems using Fermi's Golden Rule. A simple idealized model is considered in which both the TLS-phonon and TLS-electron interactions are off-diagonal, and this is analysed to infinite-order perturbation theory using quantum-field techniques. The result for the total phonon scattering rate is almost identical to Fermi's Golden Rule, except that the density of final states is replaced by the spectral density of the TLS. This spectral density cannot be calculated exactly, but consideration of its low-frequency limiting behaviour shows that resonant scattering alone cannot explain the anomalous behaviour in the saturation of the ultrasonic attenuation observed by Araki, Park, Hikata and Elbaum (1979). 114116 Dimensional shifts in phonon spectra. S.P.Chizhik, N.T.Gladikh, L.K.Grigor'yeva, R.N.Kuklin, R.G.Melkadze. *Russ. Metall. (GB)*, no.3, p.142-4 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.165-7 (1982). Examines the functional relationship of the Debye energy in relation to the magnitude of disperse particles. On the basis of the dimensional vacancy effect, which occurs in high-dispersion systems, the Debye temperature in a small particle is lower than in a large specimen. The change in Debye frequency was used to determine the ratio of the volumes corresponding to an atom and a vacancy. Estimates of the decrease of the melting point for small particles, based on the dimensional shift in the Debye temperature, is in agreement with experiment. (9 refs.)

114117 Instability of an atomic chain in a thermal force field. V.L.Gilyarov, V.A.Petrov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Lenin-grad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.267-9 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.472-7 (Feb. 1983). [received: Sept. 1983] Solutions of thermodynamic equilibrium equations for an atomic chain in a thermal force field are obtained. The solutions are used to study the simplest unstable configurations whose excitations due to thermal fluctuations can lead to the fracture of the chain. (5 refs.)

63.90 OTHER TOPICS IN LATTICE DYNAMICS AND CRYSTAL STATISTICS

114118 Hyper-Raman spectra and frequency dependence of soft mode damping in SrTiO₃. V.N.Denisov, B.N.Mavrin, V.B.Podobedov (Inst. for Spectroscopy, Acad. of Sci., Troitzk, USSR), J.F.Scott. *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.276-83 (Aug. 1983). The hyper-Raman spectra of SrTiO₃ were studied in the range 85-710K. The temperature dependence of frequencies and damping of all the vibrations, including the soft F_{1u} and silent F_{2u} modes, was obtained. Using the hyper-Raman spectra and a Green's function analysis, the authors calculated the damping function Γ_s(ω,T) in the frequency region 20-200 cm⁻¹ for temperatures between 300 and 710K. It was shown that the behavior of the soft mode damping may be described by invoking soft mode decay into two acoustic phonons (ω_s→ω_{ac}+ω_{ac}) plus an additional channel via annihilation of one acoustic phonon (ω_s+ω_{ac}→ω₁₇₆). The temperature dependence of the phonon resonance between the soft mode and the nearest polar optical phonon (at 176 cm⁻¹) was studied. Quantitative analysis of this phonon resonance was carried out to obtain parameters characterizing both modes: signs and relative magnitude of the hyper-Raman matrix elements; the soft mode damping; and the resonance coupling constant, which yields interference effects. (28 refs.)

114119 Neutron observations of phasons and amplitudons in incommensurate phases. C.M.E.Zeyen (Inst. Laue-Langevin, Grenoble, France). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.283-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). The author presents the first observations of phase modes in low-temperature incommensurate phases. The experiments were performed using thermal and cold neutron triple-axis-spectrometers at ILL on biphenyl and thorium bromide. Biphenyl is a molecular crystal exhibiting two distinct low-temperature incommensurate phases but no lock-in transition. Despite its structural complexity two low-lying phonon branches corresponding to torsional motions of the biphenyl molecule can be well studied. In the high-temperature phase one of these modes becomes soft and condenses at an incommensurate lattice position near the zone boundary. Within the incommensurate phases this mode splits into a phason with a linear dispersion and a soft-mode-like amplitudon. The other mode also splits into two distinct branches in the incommensurate phase. Thorium bromide is a structurally much simpler system which displays an incommensurate phase below 95K. Here too a high-temperature soft mode is clearly observed, and below T_C it splits into a phason and an amplitudon branch. (3 refs.)

114120 Incommensurate lattice instability in [N(CD₃)₄]₂ZnCl₄. M.Iizumi, K.Gesi (Div. of Phys., JAERI, Ibaraki, Japan). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.291-5 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). Neutron scattering measurements carried out for the deuterated crystal of tetramethylammonium tetrachlorozincate at temperatures above the normal-to-incommensurate phase transition temperature (25.5°C) have shown that the A₁ transverse phonon indicates a slight softening at q~(0, 0, 0.35) and that the quasielastic critical scattering without energy broadening develops along the (0, 0, q_z) line with a peak increasing at q_z=0.41 with decreasing temperature. The existence of the two incommensurate phases is suggested from the measurements of the modulation wave vector in the incommensurate phase (1.8 to 25.5°C) (10 refs.)

114121 Mode softening and the temperature dependence of the atomic mean-square displacement. S.L.Mair (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia). *Phys. Rev. B (USA)*, vol.28, no.5, p.2866-8 (1 Sept. 1983). The form of the temperature dependence of the mean-square displacement is derived for an atom vibrating in the presence of soft modes. The derivation, which is based on Ornstein-Zernike theory, results in a mean-square displacement with an anomalous temperature-independent positive component at temperatures greater than twice the critical temperature. 114122 Phase transformation in a linear polycrystal with a rate law of n-th order. G.E.W.Schulze (Phys. Inst., Univ. Dusseldorf, Dusseldorf, Germany). *Cryst. Res. & Technol. (Germany)*, vol.18, no.8, p.977-84 (1983). A phase transformation in a one component polycrystal starts to grow instantaneously and with a constant rate from the grain boundaries. After the time *t* there exist regions of the old and of the new phase. The derivation of the statistical quantities characterizing this state at *t* is unknown yet. Therefore the author reduces this complicated three-dimensional problem to a one-dimensional model analogously to the linear chain in lattice dynamics or to the one-dimensional energy band model. A closed analytical treatment of this model is practicable. It is derived in detail for those one-dimensional systems, which transform according to a rate law of n-th order (n≥0). (6 refs.)
114123 Hard-sphere fluid-to-solid transition and the virial expansion. V.C.Aguilera-Navarro (Instituto de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), M.Fortes, M.de Llano, A.Plastino, J.del Rio, O.Rojo. *J. Stat. Phys. (USA)*, vol.32, no.1, p.95-104 (July 1983). An exhaustive Pade approximant study of the Mayer (1977) virial series expansion is carried out for the classical hard-sphere system. As one increases the order of the different approximants a clear tendency is seen to reproduce both the random close packing divergence of the fluid branch as well as its instability (towards the crystalline phase) at the spinodal point. (27 refs.)
114124 Effect of interplane coupling in quasi-two-dimensional systems. S.T.Chui (Franklin Inst., Univ. of Delaware, Newark, DE, USA). *Phys. Rev. B (USA)*, vol.28, no.5, p.2863-5 (1 Sept. 1983). There are many divergent susceptibilities in two-dimensional systems that are not associated with phase transitions. The authors propose that when stacks of planes of these two-dimensional systems are coupled together, these divergences indicate genuine phase transitions. Applications to melting, commensurate-incommensurate transitions, and superconductivity are pointed out. (14 refs.)
114125 Influence of Jahn-Teller impurities on phase transitions. V.S.Vikhnin (Inst. of Semiconductors, Acad. of Sci., Ukrainian SSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.127-9 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.219-23 (March-April 1983). [received: Sept. 1983] The author investigates the influence of Jahn-Teller impurities on ferroelectric and nonferroelectric structural phase transitions. As mechanisms of interaction of Jahn-Teller impurities with soft modes, he considers quadratic vibron interaction with a soft mode, anharmonic third-order interaction quadratic with respect to a soft lattice mode and linear with respect to a quasilocal Jahn-Teller mode, and linear interaction with respect to soft lattice and quasilocal modes. He shows that Jahn-Teller impurities can lead to a shift of the phase transition (PT) temperature, and can induce PT in virtual ferroelectrics. He also shows that in low-symmetry phase, on account of interaction with the order parameter, acentricity of Jahn-Teller impurities is induced. Jahn-Teller impurities can lead to splitting of a PT into two PT and to reorientation of the distortion in a PT. Owing to indirect interaction between Jahn-Teller impurities via soft phonons, a quadruple pseudospin glass phase can be realized. (10 refs.)

64.70 PHASE EQUILIBRIA, PHASE TRANSITIONS, AND CRITICAL POINTS

(see also 81.30 Phase diagrams and microstructures developed by solidification and solid-solid phase transformations)

114126 Alloys with the $\text{Ge}_{1-x}\text{Ni}_x\text{Te}$ composition. M.A.Alidzhanov, I.Sh.Dadashev, L.K.Vagabova, G.I.Safaraliev (V.I. Lenin Azerbaidzhan State Pedagogic Inst., Acad. of Sci., Azerbaidzhan SSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1361-2 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1587-9 (Sept. 1982). [received: Sept. 1983]

It has been supposed that solid solutions of the GeTe-NiTe system have high thermoelectric efficiency, and it was therefore expedient to investigate the properties of this system. The authors have studied part of the phase diagram on the GeTe side, constructed by thermal analysis, microhardness determination, and certain kinetic coefficients. It was established that in the region of solid solutions based on GeTe there is a slight increase in the microhardness from $12.1 \cdot 10^{-7}$ Pa for GeTe to $15.3 \cdot 10^{-7}$ Pa for the alloy containing 20 mole % NiTe . From measurements of the Hall effect and electrical conductivity they calculated the mobility of the current carriers, which decreases smoothly with increase in the NiTe content of the GeTe . The decrease in mobility is due to the appearance of additional scattering centers. Since the germanium and nickel in this case have identical valence, these additional centers can be regarded as neutral impurities. (4 refs.)

114127 Phase equilibria in $\text{Ln}_2\text{V}_2\text{O}_7\text{-Ln}_2\text{Ti}_2\text{O}_7$ systems ($\text{Ln}=\text{Er, Lu}$). A.K.Molodkin, Yu.E.Bogotov, V.I.Moskalenko, V.N.Belan, A.V.Ershov (Patrice Lumumba Harmony of the Nations Univ., Moscow, USSR). *Inorg. Mater. (USA)*, vol.18, no.10, p.1393-5 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1625-7 (Oct. 1982). [received: Sept. 1983]

The phase equilibria in $\text{Ln}_2\text{V}_2\text{O}_7\text{-Ln}_2\text{Ti}_2\text{O}_7$ systems ($\text{Ln}=\text{Er}$ or Lu) have been studied by the method of X-ray phase analysis. In the systems investigated, $\text{Er}_2\text{V}_2\text{Ti}_{2-x}\text{O}_7$ and $\text{Lu}_2\text{V}_2\text{Ti}_{2-x}\text{O}_7$ solid solutions are formed, which crystallize in structures of the pyrochlore type. The unit cell parameters and the values of the dielectric constants of the solid solutions vary linearly as a function of the composition. (7 refs.)

114128 Order parameter for tricritical phenomena. I.L.Pegg, C.M.Knobler, R.L.Scott (Dept. of Chem., Univ. of California, Los Angeles, CA, USA). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2866-8 (21 July 1983).

Experimental three-phase coexistence curves in the tricritical region do not show the complete symmetry predicted by the simplest theories. Model calculations using the van der Waals equation yield the expected asymptotic behavior, but show that the magnitude of the departures from this behavior differs for different properties. In particular, the concentration differences at the upper and lower critical end points show the limiting form only very close to the tricritical point. (8 refs.)

114129 Model calculations for the thermodynamic equilibria in intermetallics in La-Ni under hydrogen. H.Oesterreicher (Dept. of Chem., Univ. of California, San Diego, La Jolla, CA, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.L1-3 (1983).

In previous communications the author has shown that equilibrium states of intermetallics in La-Ni under hydrogen involve complex ternary hydride phases. Examples are the transformation reactions under increasing hydrogen pressure around 500°C: $\text{LaNi}_5 \rightleftharpoons \text{LaH}_{3-x}$ and $\text{LaNi}_5 \rightleftharpoons \text{LaNiH}_{3.1}$. For LaNi_5 small changes in composition decide between the transformation reactions $\text{LaNi}_5 \rightleftharpoons \text{LaNiH}_{3.1}$, Ni and $\text{LaNi}_5 \rightleftharpoons \text{LaNi}_{3.1}$, $\text{LaNi}_{1.5}\text{H}_2$. The simple cleavage or lysis-type reaction $\text{LaNi}_5 \rightleftharpoons \text{LaH}_3$, Ni , for which evidence has been presented in the past, appears not to be an equilibrium reaction under these conditions. The author shows that simple enthalpy considerations are in accord with these findings. Furthermore they provide evidence that the energetics of a series of reactions are rather competitive and that the mode of decomposition of important hydrogen storage materials can therefore be influenced by modification of ΔH_F of the intermetallic in question through pseudobinary formation. The authors present the results of simplified model calculations for the thermodynamic drive of various possible reactions of LaNi_5 under hydrogen. (7 refs.)

114130 Critical point phenomena in fluids. D.Beyens (CENS, Gif-sur-Yvette, France).

Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.367-76

A review of critical phenomena in simple fluids and mixtures is presented, including: introduction to the universality of critical phenomena by means of the Landau theory, critical enhancement of the fluctuations, critical properties near T_c , corrections far from T_c , dynamics of fluctuations, kinetics of the phase separation process, shear flow phenomena, wetting problems. The influence of gravity is also discussed. (33 refs.)

114131 Optical investigation of critical behaviour in simple fluids at reduced gravity. P.H.Huisser, A.C.Michels, N.J.Trappeniers (Van der Waals Lab., Univ. of Amsterdam, Amsterdam, Netherlands). Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.377-84

The authors have devised an experiment to study critical behaviour in a simple fluid under strongly reduced gravitational conditions. The proposed optical techniques, elastic light scattering and interferometry are essentially noninvasive to the critical sample conditions, yield detailed quantitative information on well-defined physical quantities and, not in the last place, may allow an, albeit more qualitative, visual investigation of the underlying transient processes. In order to study the feasibility of performing such an experiment in Spacelab, the authors have been developing a full-scale engineering model, which meets the typical requirements regarding size, mass, power consumption and autonomy of operation. The authors describe this model and discuss some preliminary results. (17 refs.)

64.70D Solid-liquid transitions

(see also 81.30F Solidification)

114132 Dissipation-theory treatment of the transition from diffusion-controlled to diffusionless solidification. M.J.Aziz (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA). *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.552-4 (15 Sept. 1983).

The steady-state velocity of a planar liquid-solid interface is predicted by calculating the free energy dissipated by irreversible processes at the interface and equating it to the available driving free energy. A solute drag term and an intrinsic interfacial mobility term are included in the dissipation calculations for a binary alloy. The solute drag calculation employs a solute trapping model, which has been extended to concentrated alloys. The result is presented in terms of a single unknown parameter, the interfacial diffusivity D_i . A transition from diffusion-controlled to diffusionless solidification occurs over approximately an order of magnitude in growth velocity, as the interface speed surpasses the maximum speed with which solute atoms can diffuse across the interface to remain ahead of the growing crystal. (28 refs.)

114133 Computer simulation of high speed melting of amorphous silicon. H.C.Webber, A.G.Cullis, N.G.Chew (Royal Signals & Radar Establ., Malvern, England). *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.669-71 (1 Oct. 1983).

The laser melting of amorphous Si is accurately modelled by computer calculations. It is found that the thermal conductivity of the amorphous phase must be set at approximately 10^{-2} W/cm K, a value much lower than that of crystalline material to obtain close agreement with experimental measurements. This low value is, however, consistent with the thermal conductivities of other amorphous materials. The results of the computations, when compared with experimental observations, confirm that the melting point of ion implanted amorphous Si is below that of crystalline Si, with a best estimate in the range 1185-1385K. (21 refs.)

114134 Construction of the liquidus surface in the In-InP-GaAs-InAs system using simplex-centroid design. A.A.Selin, V.N.Vigdorovich, V.P.Batura (Moscow Inst. of Electronic Engng., Moscow, USSR). *Inorg. Mater. (USA)*, vol.18, no.10, p.1454-7 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1693-6 (Oct. 1982). [received: Sept. 1983]

With the use of simplex-centroid design the liquidus surface of the In-InP-GaAs-InAs system has been constructed. Analysis of the results obtained establishes that in a quaternary section of this system at constant indium content an increase in the indium phosphide concentration increases the liquidus temperature, an increase in the indium arsenide concentration has the opposite effect, while a change in the gallium arsenide concentration has no significant effect on the liquidus temperature, at constant concentration ratio of the other two compounds. (6 refs.)

114135 Solidification processes in saline solutions. B.Rubinsky (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.513-22 (Aug. 1983).

A numerical study using a 'front tracking' finite element method, has been performed to investigate, in conjunction with the Mullins-Sekerka stability criteria, the stability of a one-dimensional planar phase change interface (ice-water) during the solidification of a binary aqueous-saline solution, for various thermal initial and boundary conditions and various initial solute concentrations. Transient heat and mass transfer equations were solved in the solid and liquid regions. The forced convection caused by change in density between ice and water was considered. The results indicate that the proposed method can be employed to determine the morphology of a phase change interface as a function of exterior thermal boundary conditions and to determine the transition between a stable planar front and an unstable (perturbed) front. (21 refs.)

114136 On the physics of state transition. G.V.Abi-Ghanem, V.V.Nguyen (Dept. of Civil Engng., Princeton Univ., Princeton, NJ, USA). *J. Phys. A (GB)*, vol.16, no.14, p.3401-8 (1 Oct. 1983).

In the melting of a solid crystalline medium, the shear modulus changes abruptly to zero. This behaviour can be explained firstly by representing the stress tensor in terms of the correlation function and the potential of interaction of the system and secondly by using an extension of Ruelle's criterion (1977) for thermodynamic stability. (17 refs.)

114137 Localized volume deficiencies as an effect of spherulite growth. I. The two-dimensional case. A.Galeski, E.Piorkowska (Centre of Molecular & Macromolecular Studies, Polish Acad. of Sci., Lodz, Poland). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.8, p.1299-312 (Aug. 1983).

Two-dimensional spherulite growth leads to the encirclement of regions of molten polymer in a polymer film. On further crystallization localized volume defects arise, resulting in thin spots in the film. Since this effect lowers the mechanical strength of films, the authors call these volume defects 'weak spots'. A computer program is developed to evaluate the number, size, and shape of such volume defects for athermal, thermal, and mixed modes of primary nucleation of spherulites. It is shown that the total area of weak spots exceeds 10% of the sample area for all types of nucleation studied. The largest weak spots arise in samples crystallized via athermal and mixed nucleation; their size is of the same order as that of an average spherulite. Formation of weak spots is observed in thin films of poly(ethylene oxide) and poly(methylene oxide). The disadvantageous role of weak spots is confirmed by observation of electric breakdown occurring preferentially in weak spots in polypropylene films. (7 refs.)

114138 Localized volume deficiencies as an effect of spherulite growth. II. The three-dimensional case. A.Galeski, E.Piorkowska (Centre of Molecular & Macromolecular Studies, Polish Acad. of Sci., Lodz, Poland). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.8, p.1313-22 (Aug. 1983). For pt.1 see *ibid.*, vol.21, no.8, p.1299-312 (1983). As in the two-dimensional case, the density change due to crystallization leads to a buildup of internal strain in some regions of a polymer melt occluded by growing spherulites. The occluded parts of the sample are called 'weak spots.' Computer simulation of spherulite growth in bulk samples shows that the largest weak spots have the size of an average spherulite. The total volumes of weak spots are 0.47, 0.094, and 0.119% of the sample for athermal, thermal, and mixed primary nucleation, respectively. The weak spots in the bulk material exhibit distance correlation. Within weak spots, internal strain is released (Raman spectroscopy), and holes develop. Polypropylene bulk spherulite samples contain holes distinctly visible under a microscope with infrared optics and illumination. The number of visible holes is in agreement with the computer prediction. The increase of impact strength with decreasing spherulite size is explained in terms of changes in the number and size of weak spots. (23 refs.)

114139 Retardation of spherulitic growth rate in the crystallization of isotactic polystyrene due to the presence of nucleant. M.A.Kennedy, G.Turturro, G.R.Brown, L.E.St-Pierre (Dept. of Chem., McGill Univ., Montreal, Canada).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1403-13 (Aug. 1983). Although the rate of heterogeneous nucleation of crystallization in isotactic polystyrene, as studied by photomicroscopy, is markedly increased by addition of fine-particle silica, the rate of subsequent radial growth of spherulites formed is diminished. The latter observation is rationalized on the basis of a modified Hoffman-Lauritzen treatment wherein the nucleant is depicted as a quasicrosslink which impedes the transport of polymer segments. (20 refs.)

114140 Calculation of phase equilibria of ternary additive molten salt systems with a common anion. I.J.Gal (Dept. of Chem., Univ. of Belgrade, Belgrade, Yugoslavia), I.J.Zsigrai, I.Paligoric, K.Szecsényi-Meszaros. *J. Chem. Soc. Faraday Trans. 1 (GB)*, vol.79, pt.9, p.2171-8 (Sept. 1983). Phase diagrams for ternary additive systems $\text{LiF}+\text{NaF}+\text{KF}$, $\text{LiF}+\text{NaF}+\text{CaF}_2$, $\text{LiF}+\text{NaF}+\text{SrF}_2$ and $\text{NaF}+\text{KF}+\text{SrF}_2$ have been calculated a priori using a set of readily available physical parameters for each component. The method of calculation is based on a simple ion-interaction model developed for binary molten salt systems and now extended to ternary additive salt mixtures. Calculated and experimentally derived phase diagrams are compared and discussed. (18 refs.)

114141 The precipitation and characterization of cobalt (II) oxalate tetrahydrate. E.Wisgerhof, J.W.Geus (Dept. of Inorganic Chem., Univ. of Utrecht, Utrecht, Netherlands).

Mater. Res. Bull. (USA), vol.18, no.8, p.993-1000 (Aug. 1983). Mixing of solutions of Co^{2+} and $\text{C}_2\text{O}_4^{2-}$ ions can lead to crystallization of cobalt (II) oxalate both as a tetrahydrate and a dihydrate. Up to about 60°C acicular crystallinities of a greyish pink tetrahydrate initially result. In a period depending mainly on the temperature and to a lesser extent on the degree of supersaturation and the $[\text{C}_2\text{O}_4^{2-}]/[\text{Co}^{2+}]$ ratio, the precipitated tetrahydrate recrystallizes to β -cobalt (II) oxalate, a bright pink dihydrate. The two cobalt (II) oxalates have been distinguished by means of X-ray diffraction (XRD), (electron)microscopy and thermal analysis. The d-values and relative peak heights of the most pronounced maxima of the XRD-pattern of the tetrahydrate are presented, as these are not available in standard reference works. (7 refs.)

114142 On cellular instability in the solidification of a dilute binary alloy. G.I.Sivashinsky (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Physica D (Netherlands), vol.8D, no.1-2, p.243-8 (July 1983). In the solidification of a dilute binary alloy, a planar solid-liquid interface is often found to be unstable, spontaneously assuming a cellular structure. If the solute rejection coefficient is close to unity, then, near the stability threshold, the characteristic cell size may significantly exceed the diffusional width of the solidification zone. This situation enables one to derive an asymptotic nonlinear equation which directly describes the dynamics of the onset and stabilization of cellular structure: $f_t + \nabla^2 f + \nabla[(2-f)\nabla f] + af = 0$. (12 refs.)

114143 The supercooling of the water droplets. R.Shimomura, K.Ichimiya, T.Miyazawa, Y.Hanada, Y.Shintani. *Refrigeration (Japan)*, vol.58, no.666, p.339-45 (April 1983). In Japanese.

In order to study the freezing of supercooled water, measurements were made of the freezing point of water droplets, ranging from 1.2 mm to 4.00 mm in diameter, suspended at the interface of two insoluble liquids and cooled at rates of 0.13-0.75°C/min. The relation between the degree of supercooling, the cooling rate and the diameter of water droplets was arranged experimentally by using probability of freezing. Additionally, the relation was generally extended by three kinds of dimensionless parameters which were obtained by dimensional analysis. (14 refs.)

114144 Melting in a two-dimensional system with dipolar interactions. V.M.Bedanov, G.V.Gadiyak, Yu.E.Lozovik (Inst. of Theoretical & Appl. Mech., Acad. of Sci., Novosibirsk, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.328-9 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.577-80 (Feb. 1983). [received: Sept. 1983]

The authors use molecular dynamic methods to study the phase transition in a system of classical dipoles and discuss qualitative and quantitative differences between such a system and a system of classical electrons moving in a homogeneous positively charged background. They assume that all the dipoles are oriented in the vertical direction and can move freely in the horizontal plane. (11 refs.)

114145 Dislocation mechanism of crystal melting. S.P.Obukhov (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).

Sov. Phys.-JETP (USA), vol.83, no.5, p.1144-7 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1978-84 (Nov. 1982). [received: Sept. 1983]

A field model is constructed for the description of a system of interacting dislocation lines. In this model the liquid-crystal transition corresponds to the appearance of infinitely long (unclosed) dislocation lines. It is shown that this transition is of first order. (10 refs.)

114146 Evaluation of kinetic parameters from non-isothermal experiments: Application to crystallization kinetics. T.Kemeny, L.Granasy. *Report KFKI-1983-73*, Hungarian Acad. Sci., Budapest (1983), 10 pp.

Kinetic parameters are usually evaluated from nonisothermal experiments by supposing the same form of the rate equation in isothermal and dynamic investigations. The capabilities and limitations of this approach will be discussed. The applicability of the alternative hypothesis where the transformed fraction is a state function of its variables and the rate equation is different under isothermal and nonisothermal conditions is highly questionable for any processes. This approach is definitely invalid for crystallization kinetics as it contradicts the formal theory of solid state transformations. (27 refs.)

114147 Solidification front dynamics in model systems. A.Ecker, P.R.Sahm (Aachen Inst. of Technol., Aachen, Germany).

Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.331-6

Optical methods are particularly useful for the analysis of solidification phenomena in transparent model systems. The authors describe work carried out on thermo-solutal boundary layers which interact with 'macroscopic' convective melt movement. Both pure and alloyed succinonitrile probes are investigated. The measurement system ODES (optical diagnostic experiment system) has been mounted around a 'transparent mold' that is controllable with respect to temperature gradients, velocity of the melt and also growth velocities of the crystallization front. The particular research is being performed in preparation of the German D1-Mission by the experiment GETS (boundary layers in transparent solidifying melts). The results are to be checked against existing stability criteria of the solidification front. (7 refs.)

114148 Solidification of Pb-Sn alloys under microgravity conditions. L.L.Regel, I.V.Barmine, A.M.Durachenko (Space Res. Inst., Acad. of Sci., Moscow, USSR), L.Oyunbiling.

Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.417-20

Discusses the experimental results of studying the effect of microgravity conditions on a homogenization of metal melts and on a subsequent bulk crystallization using Pb-Sn alloys as an example. The experiment was carried out on board the Salyut-6 station following the ALTAI Soviet-Mongolian program. (4 refs.)

114149 Periodic crystallization of binary melts under diffusion-controlled mass transfer. L.L.Regel, Nguyen Thanh Nghi (Space Res. Inst., Acad. of Sci., Moscow, USSR).

Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.421-7

The peculiarities of the crystallization process from the liquid phase under purely diffusion mass transfer conditions leading to the macroperiodic variations of crystal composition and structural perfection are considered. The results of a number of the crystal growth experiments are given in which the periodic composition distribution with large period and amplitude of fluctuations were observed. The criteria for the choice of technological parameters of growth process with account for phase diagram and component diffusion coefficients of concrete systems for preventing the macroinhomogeneity in the crystals grown are discussed. (16 refs.)

114150 Directional crystallization of PbTe under microgravity conditions. L.L.Regel, Nguyen Thanh Nghi, O.I.Rachmatov (Inst. for Space Res., Acad. of Sci., Moscow, USSR).

Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.429-33

The PbTe undoped single crystals were grown by directional crystallization from partially remelted cylindrical ingots in the [100] direction in the Splay furnace under microgravity conditions and on Earth. The surface morphology, structural perfection and electrical physical parameters of the space- and earth-grown crystals were comparatively investigated. The differences in morphological characteristics of space- and earth-grown PbTe crystal were found. Significant inhomogeneities were observed both in space- and earth-grown ingots which indicate a nonsteady-state of the growth process. (2 refs.)

64.70F Liquid-vapour transitions

- 114151 Vaporisation of tungsten bronzes. II. Sodium and potassium tungsten bronzes. N.J.Clark, P.L.Mart (School of Phys. Sci., Flinders Univ. of South Australia, Bedford Park, Australia). *Mater. Res. Bull. (USA)*, vol.18, no.8, p.951-8 (Aug. 1983). Thermodynamic calculations indicate that the disproportionation of sodium tungsten bronze is expected to occur at a lower temperature than that required for direct decomposition via congruent vaporisation. This expectation has been tested for cubic sodium bronzes and also for cubic europium and cerium bronzes, a tetragonal II potassium bronze and hexagonal bronzes of potassium, indium and thallium. Knudsen weight loss and Knudsen mass spectrometry results confirm that disproportionation is the dominant reaction for cubic and tetragonal bronzes. The hexagonal bronzes are resistant to disproportionation and vaporisation of K_{0.22}WO₃ occurs by the following K_{0.22}WO₃(s)→0.22K(g)+0.14 O₂(g)+0.056 W₁₈O₄₉(s) with an enthalpy of vaporisation of 405 kJ mol.⁻¹. - 114153 Dynamics of NH₄Cl particle nucleation and growth at 253-296K. J.F.Henry, A.Gonzalez, L.K.Peters (Dept. of Chem. Engng., Univ. of Kentucky, Lexington, KY, USA). *Aerosol Sci. & Technol. (USA)*, vol.2, no.3, p.321-39 (1983). Particle dynamics in the NH₃-HCl-NH₄Cl particle system are modeled for particle growth times exceeding the induction time for the initial appearance of particles. The model results of Dhalin et al. (1981) at 296K are confirmed, and the appropriate microscopic surface free energy is practically independent of reactant concentrations over small concentration ranges at 296K. Over larger concentration ranges, the value of the surface free energy required to explain the data varies appreciably, increasing as initial reactant concentration increases. At relatively long particle growth times, diffusional growth together with coagulation adequately describes the experimental data, although the coagulation coefficient must be increased over the Brownian value to account for other effects. Possible mechanisms such as cluster scavenging, charge-induced coagulation, particle evaporation and NH₄Cl vapor formation on reactor walls apparently do not affect the model predictions even at small particle growth times. - 114154 Structural transformations and their precursors. T.R.Finlayson (Phys. Dept., Monash Univ., Clayton, Victoria, Australia). *Aust. J. Phys. (Australia)*, vol.36, no.4, p.553-63 (1983). For a number of materials which exhibit a change of structure on being cooled below a certain temperature T_m , some physical properties display anomalous behaviour at temperatures above T_m . The particular structural transformations in mind have been broadly classified as 'martensitic' and the anomalous physical properties as 'precursive phenomena'. Some debate exists regarding the role of the precursive phenomenon in the kinetics of the structural transformation. The most direct evidence for 'martensite precursors' is obtained from electron diffraction, although various indirect evidence is contained in X-ray, neutron and γ -ray diffraction and various physical properties, for example, elastic constants and thermal expansion. In the paper current understanding of 'martensite precursors' is reviewed and examples of data from the Al₅ structure compounds V₃Si and Nb₃Sn, In-Tl and Ti-Ni alloys are discussed. (33 refs.)
- 114155 Determination of the phase ranges during cooling and heating of Al-40 wt.-% (0-3) wt. % Mg alloys. B.Major, R.Ciach, G.Wendrock, H.Löffler (Inst. für Metallforschung, Polnischen Akad. der Wissenschaften, Krakow, Poland). *Cryst. Res. & Technol. (Germany)*, vol.18, no.8, p.1021-8 (1983). The various phases and the respective ranges of their existence were determined during continuous cooling from temperatures close below the solidus line to RT with a rate of 2K min.⁻¹ as well as during the subsequent heating in few Al-Zn(40 wt.%)Mg(X) alloys (X=0; 0.5; 1.0; and 3.0 wt.%) by means of X-ray phase-analysis, small angle X-ray scattering, differential thermo-analysis, optical microscopy, and X-ray micro-analysis. The most striking features are that even addition of only 0.5 wt. % Mg cause the formation of precursors of the MgZn₂ equilibrium phase few degrees below the solidus line. (7 refs.)
- 114156 Thermodynamic theory of phase transitions in solid solutions based on lead metaniobate. I.L.Kraizman, V.P.Sakhnenko (Rostov State Univ., Rostov, USSR). *Inorg. Mater. (USA)*, vol.18, no.10, p.1395-8 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1628-31 (Oct. 1982). [received: Sept. 1983] It is shown that phase transitions in lead niobate, lead tantalate, and their solid solutions can be described by a single thermodynamic potential with second-order parameters. The x, T phase diagram for the solid solutions Pb(Nb_{1-x}Ta_x)₂O₆ should contain two closely situated triple points and a critical point. An assumption is expressed that the paraelectric phase of lead tantalate is crystallized into the space group D_{2h}¹⁷ or D_{2h}¹⁸. The ferroelectric transition in lead tantalate is a transition close to the critical point. (9 refs.)
- 114157 Pressure-induced phase transition of HgS. T.Huang, A.L.Ruoff (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.5459-61 (Sept. 1983). The high pressure phase transition of cinnabar (α -HgS) was studied by energy dispersive X-ray diffraction using a synchrotron X-ray source. The cinnabar crystal structure was found to transform to the sodium-chloride structure at about 130 kbar. The lattice parameter of the new phase was determined to be 5.070±0.005 Å at 300 kbar. No further phase transition was observed up to 400 kbar. (18 refs.)
- 114158 Critical fluctuations at the phase transition in benzil. A.Yoshihara, E.R.Bernstein, J.C.Raich (Depts. of Chem. & Phys., Colorado State Univ., Fort Collins, CO, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2504-14 (15 Sept. 1983). New Brillouin scattering data are presented for benzil single crystals near the phase transition at 83.5K. These data demonstrate that for the c₁₁ governed longitudinal acoustic (LA) mode at ~15 GHz, critical fluctuations are quite large near the phase transition and dominate the behaviour of this mode within +40K of the transition. These observations are analyzed in terms of four contributing soft modes: an optical soft mode and two transverse acoustic (TA) soft modes at the zone center and a zone boundary M-point soft mode. It is argued that the zone boundary mode is the major contributor to the width and elastic constant anomalies of the LA mode. Calculations of these properties support these conclusions. Critical exponents are evaluated for Δc_{11} and $\Delta \Gamma_{\text{ac}}$, the critical contributions to the elastic constant and width of the c₁₁ governed LA mode, based on the experimental data. (22 refs.)
- 114159 Phase transitions in Pb₃(P_{1-x}As_xO₄)₂: influence of the central peak and flip mode on the Raman scattering of hard modes. E.Salje, V.Devarajan, U.Bismayer, D.M.C.Guimaraes (Inst. für Kristallographie und Petrographie, Univ. Hannover, Hannover, Germany). *J. Phys. C (GB)*, vol.16, no.27, p.5233-43 (30 Sept. 1983). The integrated intensities and full width at half maximum (FWHM) of the 80 cm⁻¹ Raman bands (hard modes) of ferroelastic Pb₃(PO₄)₂ and Pb₃(P_{0.77}As_{0.23}O₄)₂ were investigated in both the ferro and 'intermediate' phases for different polarisations as functions of temperature. The observed behaviour of these quantities has been interpreted in terms of interactions of hard modes with the central peak, flip mode and soft mode. The consequences of the three-component order parameter interpretation of the phase transition are also discussed. The integrated intensity curves in the 'intermediate' phase revealed a 'precursor order parameter' type of dependence. The numerical value of this 'precursor order parameter' at T_c is also estimated for Pb₃(PO₄)₂. From the FWHM versus temperature curves in the 'intermediate' phase, the flip mode frequency is estimated to be 3×10¹⁰ Hz. (21 refs.)
- 114160 Mossbauer and X-ray structure studies on the phase transition in the Fe(III) dimethylsulfoxide complex. I.G.Gusakovskaya, T.I.Larkina, V.I.Ponomarev, L.O.Atomyan (Inst. of Chem. Phys., Acad. of Sci., USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.864-9 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.53-8 (Nov.-Dec. 1982). [received: Sept. 1983] Spectrometry, calorimetry, and X-ray structure analysis have been used to examine the structure of the [Fe(DMSO)₅Cl]²⁺ cation in the [Fe(DMSO)₅Cl][Fe₂Cl₆O] complex over a wide temperature range. There is a

first-order phase transition in the cation associated with position change in one of the five DMSO addends from the octahedral environment of the Fe ion. (12 refs.)

114161 Physics of diffused phase transitions in silver chalcogenides. B.N.Rolov. *Lav. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.33-6 (1983). In Russian.

The thermodynamic theory of diffused phase transitions in silver chalcogenides is considered. The correspondence of the observed substance phase transitions in this group to the general theory of diffused phase transitions in condensed matter is treated. In correspondence to experimental data the main characteristics of the switching function are evaluated. The minimum volume of the sharp phase transition is calculated. The proposed mechanism of phase transitions in chalcogenides is considered. (6 refs.)

114162 Absence of pressure-induced valence change in CeAs. A.Werner, H.D.Hochheimer (Max-Planck-Inst. fur Festkörperforschung, Stuttgart, Germany), R.L.Meng, E.Bucher.

Phys. Lett. A (Netherlands), vol.97A, no.5, p.207-9 (29 Aug. 1983). The pressure-volume relationship for cerium monoarsenide has been determined up to a pressure of 32 GPa using energy dispersive X-ray diffraction. Contrary to expectations based on the behaviour of CeP, cerium arsenide does not show a pressure-induced valence change in this pressure range. Instead the authors find a structural transition from the NaCl-type to the CsCl-type structure, which exhibits a large hysteresis. Contrary to other results the value of the bulk modulus ($B_0 = 69 \pm 1$ GPa) agrees well with the value expected from an Anderson-Nafe plot for CeAs with the Ce ion in the trivalent state. (11 refs.)

114163 Proton dynamics at the ferroelastic phase transition in $\text{KH}_2(\text{SeO}_3)_2$. Y.Yamada, Y.Noda, Y.Endoh (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).

Physica B & C (Netherlands), vol.120B+C, no.1-3, p.270-4 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

The authors observed the neutron inelastic scattering at the ferroelastic phase transition point of $\text{KH}_2(\text{SeO}_3)_2$ in order to investigate the dynamical properties of proton tunneling and its role in triggering the phase transition. The parameters ω_p (tunneling frequency), γ_p (damping constant of proton motion), and G (effective coupling constant between phonons and protons) have been determined by fitting the obtained profiles of neutron spectra in the (k - ω) space at various temperatures. It has been shown that $\hbar\omega_p \ll kT_c$, which excludes the possibility that the dynamical property of protons is the essential origin of the large isotope effect in this substance. (10 refs.)

114164 Neutron diffraction and scattering study on M_xWO_3 ($\text{M}=\text{Rb}$ and K). M.Sato, H.Fujishita, A.R.Moodenbaugh, S.Hoshino, B.H.Grier (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

Physica B & C (Netherlands), vol.120B+C, no.1-3, p.275-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

To study the relationship between the lattice instability and the superconductivity of nonstoichiometric hexagonal tungsten bronze, M_xWO_3 , neutron diffraction and scattering studies were made. Two types of the structural phase transitions were observed. One is associated with the distortion of the corner linked WO_6 octahedra. The other is associated with the ordering of the M atoms which partially fill the sites in the WO_3 cage. A long period modulation of the structure appears for some values of x at low temperature. A discussion on the x dependence of the superconducting transition temperature is presented. (10 refs.)

114165 Neutron spectroscopy of anilinium bromide. B.P.Schweiss, H.Fuess, G.Flecher, A.Weiss (Inst. fur Kristallographie und Mineralogie, Univ. Frankfurt am Main, Frankfurt am Main, Germany).

Physica B & C (Netherlands), vol.120B+C, no.1-3, p.300-4 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

The phase transition from the orthorhombic high temperature phase (I) to the monoclinic low temperature phase (II) in anilinium bromide which occurs at $T_c = 296.9\text{K}$ was studied by incoherent inelastic neutron scattering. Time-of-flight data were obtained from a hydrogenated $\text{C}_6\text{H}_5\text{NH}_2\text{Br}$ and partially deuterated samples ($\text{C}_6\text{D}_5\text{NH}_2\text{Br}$ and $\text{C}_6\text{H}_5\text{ND}_2\text{Br}$) below and above the transition temperature. Phonon frequency distributions in the range of the intermolecular vibrations were derived from the spectra. The analysis of the quasielastic line revealed substantial broadening. The interpretation lead to reorientational jump processes in the orthorhombic phase (I) and—with a markedly diminished rate—in the monoclinic phase (II). The activation energies were estimated for both phases. (12 refs.)

114166 Phase transitions between incommensurate phases in systems with a four-component order parameter illustrated for BaMnF_4 . V.A.Golovko (Evening Inst. of Metall., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.314-15 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.557-9 (Feb. 1983). [received: Sept. 1983]

In contrast to systems described by a two-component order parameter, which have been studied extensively, incommensurate phases of different symmetries can occur for systems described by a many-component order parameter (depending on crystal parameters). Changes in external parameters may lead to phase transitions between various incommensurate phases as in the case of commensurate phases. The author studies phase transitions between incommensurate phases of BaMnF_4 crystals for which an incommensurate phase is described by a four-component order parameter. (8 refs.)

114167 Effect of pressure on the phase transitions in the elpasolites $\text{Cs}_2\text{NaB}^{3+}\text{Cl}_6$. M.V.Gorev (L.V. Kirenskii Phys. Inst., Acad. of Sci., Krasnoyarsk, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.320-1 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.566-8 (Feb. 1983). [received: Sept. 1983]

The author reports a study of the influence of pressure up to 5 kbar on the phase transitions in three crystals of the family $\text{Cs}_2\text{NaB}^{3+}\text{Cl}_6$ ($\text{B}^{3+}=\text{Bi}$, Nd , or Pr). Differential thermal analysis (DTA) with a copper-germanium thermocouple was used to detect the transition. (8 refs.)

114168 Influence of the degree of purity on high-temperature phase transitions in samarium. A.T.Burkov, M.V.Vedernikov, T.V.Nikiforova, N.N.Rytus (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.323-4 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.570-2 (Feb. 1983). [received: Sept. 1983]

On the whole, investigations conducted to date do not enable one to say whether one or two phase transformations exist in samarium between 500 and 1000K, whether they exist in perfectly pure samarium, and how the degree of purity of the metal affects the transformation temperature. To clarify these

questions the authors have made a detailed investigation of the thermoelectromotive force and the electrical resistivity of samarium of two different degrees of purity at temperatures ranging from 300 to 1300K. (11 refs.)

114169 Statistical model of the phase transition in $\text{KH}_2(\text{SeO}_3)_2$. R.Kh.Sol'tsas, V.E.Shneider (Inst. of Semiconductor of Phys., Acad. of Sci., Lithuanian SSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.123-6 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.213-18 (March-April 1983). [received: Sept. 1983]

A statistical model of the phase transition in $\text{KH}_2(\text{SeO}_3)_2$ is constructed on the assumption that the transition causes ordering of one of the three nonequivalent hydrogen ions in the molecule. Tunneling of this proton under the potential barrier is neglected. The thermodynamic properties of the model are studied in the cluster approximation. A comparison is made with the available experimental data for $\text{KH}_2(\text{SeO}_3)_2$ and $\text{KD}_2(\text{SeO}_3)_2$. The correspondence between the micromechanisms of the phase transition in $\text{KH}_2(\text{SeO}_3)_2$ and $\text{NaH}_2(\text{SeO}_3)_2$ crystals is discussed. (18 refs.)

114170 The phase transitions and crystal structures of a new compound— Sr_2CaWO_6 . Fu Zhengmin, Li Wenxiu (Inst. of Phys., Acad. Sinica, Beijing, China), Liang Dongcai.

Sci. Sin. (China), vol.26, no.8, p.835-47 (Aug. 1983).

The phase transitions of the new compound Sr_2CaWO_6 have been investigated by means of DTA, X-ray powder diffraction, precise measurement of lattice parameters and other methods. It has been discovered that the compound has a displacive phase transition of the first order. The low temperature phase, $\alpha\text{-Sr}_2\text{CaWO}_6$, belongs to orthorhombic crystal system, with space group $\text{Pmm}2$, lattice parameters at room temperature are: $a=8.2033\text{Å}$, $b=5.7676\text{Å}$ and $c=5.8489\text{Å}$, the measured density is $D_m=5.981\text{g/cm}^3$, and each unit cell contains two formula weight. The high temperature phase, $\beta\text{-Sr}_2\text{CaWO}_6$, belongs to the cubic system, with space group $\text{Fm}3m$ and the lattice parameter is $a=8.308\text{Å}$ at 900°C ; $z=4$. The crystal structures of $\alpha\text{-Sr}_2\text{CaWO}_6$ and $\beta\text{-Sr}_2\text{CaWO}_6$ have been determined by means of the X-ray polycrystal diffraction method. The character of the structures and the possibilities of phase transition are discussed. (4 refs.)

64.70M Transitions in liquid crystals

- 114171** Formation of a liquid crystal phase in the conversion of isotropic solutions of cellulose acetates into the solid state. V.Yu.Yunusov, O.A.Khanchich, A.T.Serkov, M.T.Primkulov. *Vysokomol. Soedin. Ser. B (USSR)*, vol.25, no.6, p.395-6 (1983). In Russian. The conditions for the conversion of an isotropic solution into the mesomorphic state on evaporation of the solvent are studied, using solutions of cellulose diacetate and cellulose triacetate in mixtures of N-methylpyrrolidone with methylene chloride and butan-2-one as test materials. The structural changes occurring during evaporation are followed by means of low angle scattering of polarized light, polarization microscopy, and measurement of the light transmission intensity. The results show that after the evaporation of low boiling point solvents a liquid crystal phase is produced in solutions of cellulose diacetate and triacetate and anisometric structures characteristic of liquid crystal systems are formed. (5 refs.) *N.S.*
- 114172** Mesomorphic salts of pyrylium and thiopyrylium. V.Gionis, R.Fugnitto, H.Strzelecka (CNRS, Thiais, France), P.Le Barny. *Mol. Cryst. & Liq. Cryst. (GB)*, vol.95, no.3-4, p.351-8 (1983). In French. Some of the synthesis intermediate perchlorate salts of 2,6- λ diaryl pyrylium and thiopyrylium shown a mesomorphic behaviour. So the introduction of long alkyl or alkoxy chain substituents, in para position of the phenyls leads to liquid-crystals for both pyrylium and thiopyrylium perchlorates, but the mesomorphic phase is larger for the thiopyrylium ones. The systematic study of the position of the substituent in the phenyl cycle of pyrylium salts demonstrates that the meta-substituted compounds have a lower transition temperature (Cr-M) than the para. Finally the ortho ones do not exhibit a liquid-crystal behaviour. Between the dialcoxy-substituted pyrylium salts, only the ortho, meta ones show mesomorphic phase, and the effect of the introduction of the second alkoxy-chain is the decrease of the transition temperature (Cr-M). The latter leads to liquid crystals at room temperature. (15 refs.)

64.70P Glass transitions

- 114173** Glass formation region and electrical conductivity in the system $B_2O_3-Li_2O-Li_3PO_4$. B.Basu, H.S.Maiti, A.Paul (Materials Sci. Centre, Indian Inst. of Technol., Kharagpur, India). *Bull. Mater. Sci. (India)*, vol.5, no.1, p.21-8 (March 1983). [received: Sept. 1983]
- The glass formation region was determined for the $B_2O_3-Li_2O-Li_3PO_4$ system. Under the present experimental conditions, binary lithium borate glasses could be formed containing a maximum of 27 mol.% Li_2O . However, this could be increased to 36 mol.% in the ternary system. Electrical conductivity was measured at temperatures ranging from room temperature to 350°C. The temperature dependence of the electrical conductivity of these glasses follows an Arrhenius equation. The conductivity increased with increasing alkali content. Maximum conductivity of the order of $10^{-4} \text{ ohm}^{-1} \text{ cm}^{-1}$ was obtained with the glass containing about 36 mol.% Li_2O at 250°C. Activation energy for conduction also varied with the total Li_2O content. (12 refs.)
- 114174** Inelastic neutron scattering study of the structural glass transition in a K(Br,CN) mixed crystal. A.Loidl, K.Knorr (Inst. für Phys., Johannes Gutenberg Univ., Mainz, Germany), R.Feile, J.K.Kjems. *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1054-7 (19 Sept. 1983). The coupled rotational-translational excitations in $(KBr)_{0.992}(KCN)_{0.008}$ were studied by inelastic neutron scattering. For the first time the $A_{1g}-T_{2g}$ tunneling transition and the $A_{1g}-E_g$ librational excitation were followed at the transition from the paraelastic to the structural glass state. The drastic reduction of the T_{2g} rotation-translation coupling suggests that the number of free-ion tunneling states is reduced in favor of cluster reorientation modes which are effectively decoupled from the lattice. 64.75 SOLUBILITY, SEGREGATION, AND MIXING

- 114175** Solubility of carbon and ageing of Kh15Yu5 type alloys. N.A.Gorokhova, S.O.Suvorova, V.I.Sarrak, L.L.Zhukov (Inst. of Metall. & Phys. of Metals, Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.280-5 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- Changes in the mechanical properties of iron-chromium-aluminium alloys with the ageing temperature was compared with the solubility curves of carbon obtained by the internal friction method. The changes in the strength of iron-chromium-aluminium alloys were correlated with changes in the carbon content in the solid solution. (14 refs.) *A.T.*

- 114176** Solid-solution decomposition in CdS-CdTe films. V.Ya.Vityuk, V.A.Sanitarov, N.N.Zavleshko, I.P.Kalinkin (Lensovet Technol. Inst., Leningrad, USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1294-8 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1514-17 (Sept. 1982). [received: Sept. 1983]
- It has been found that thermodynamically unstable films of $CdS_{1-x}Te_x$ ($0.1 < x < 0.9$) solid solutions decompose above 573K with the formation of α_1 and α_2 solid solutions. The degree of phase transformation is determined by the dispersion of the structure and the nonequilibrium state of the initial film. The decomposition occurs most completely and with a high rate in films produced under maximally nonequilibrium conditions. (10 refs.)
- 114177** Effect of the structural properties of compounds in the system $Bi_2O_3-EO_2$ (E=Ge, Si) on their dissolution. L.S.Tarasova, A.V.Kosov (Krasnoyarsk State Univ., Krasnoyarsk, USSR). *Inorg. Mater. (USA)*, vol.18, no.10, p.1384-8 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1615-19 (Oct. 1982). [received: Sept. 1983]
- The effect of the structural characteristics on the dissolution of compounds in the systems $Bi_2O_3-EO_2$ (E=Ge, Si) was investigated. It was found that the dissolution of the compound $6Bi_2O_3 \cdot EO_2$ with the sillenite structure is a two-stage process, which is explained with the help of a model in which bismuth atoms can occupy two crystallochemical positions. The single-stage nature of dissolution of compounds $2Bi_2O_3 \cdot 3EO_2$ with the evlinitic structure is due to the fact that bismuth atoms occupy single positions in them, which agrees with the generally accepted structural model of these compounds. The two-position distribution of bismuth atoms in the structure of sillenites is confirmed by NMR and IR spectroscopy. (7 refs.)
- 114178** Effect of composition on the properties of five-component solid solutions. V.N.Vigdorovich, A.A.Selin, V.A.Khanin (Moscow Inst. of Electronic Engng., Moscow, USSR). *Inorg. Mater. (USA)*, vol.18, no.10, p.1457-60 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1697-9 (Oct. 1982). [received: Sept. 1983]
- The authors have analyzed five-component systems formed by III-V elements and determined spectral ranges over which ideal heterostructures, i.e. two-component substrate/five-component solid solutions, can function. Analytical expressions were obtained for calculating the properties of five-component solid solutions. (6 refs.)
- 114179** Solubility of H_2 -He mixtures in fluid phases to 1 GPa. F.H.Ree (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2846-52 (21 July 1983).
- Statistical mechanical variational theory and an improved van der Waals one-fluid model have been used to compute the solubility lines of hydrogen-helium mixtures in fluid phases at several temperatures. Quantum corrections to $O(h^2)$ are included. This is done by developing a new formula for the effective one-component mass for the mixtures. Monte Carlo simulations were performed to show the reliability of the new theoretical model. The solubility lines of the H_2 -He mixtures predicted with the new theory give satisfactory agreement with the experimental data of Streett at 7261.5K and to 1 GPa in pressure. At lower temperatures higher order quantum corrections to thermodynamic data become increasingly important. (56 refs.)
- 114180** Solubility and diffusivity of hydrogen in Li_2O . H.Katsuta, S.Konishi, H.Yoshida (JAERI, Ibaraki-ken, Japan). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.244-8 (June 1983).
- The solubility and the diffusivity of hydrogen and deuterium in sintered Li_2O pellets were measured by a thermodynamical technique such as equilibrium-quenching and the hot-extraction method. The hydrogen solubility was found to obey Sieverts' law. The diffusion coefficient and its activation energy for hydrogen (deuterium) in Li_2O at the temperature region from 500 to 800°C were similar to those for tritium in neutron irradiated Li_2O . These hydrogen behaviours seem to be different from those in the lower temperature region where $LiOH$ can stably exist. (18 refs.)
- 114181** Irradiation-induced segregation in multi-component alloys. I.-W.Chen (MIT, Cambridge, MA, USA). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.249-59 (June 1983).
- A unified analysis of irradiation-induced segregation in multi-component alloys is developed using the formulation of irreversible thermodynamics. Three distinct mechanisms for segregation, namely the inverse Kirkendall effect, the vacancy-wind effect, and the solute drag of interstitials, are identified. In particular, the inverse Kirkendall effect due to interstitials arises only if a solute-interstitial interaction or a mutual conversion among interstitials via lattice atom intermediaries operates simultaneously. In the limit of fast conversion a paraequilibrium state may be reached between interstitials and lattice atoms, and the interstitial mechanism becomes formally analogous to the vacancy mechanism. Although the past treatment of rate phenomena in this field was apparently limited to the latter case, the importance of the consideration of separate chemical potentials for interstitials of different species, in segregation and other irradiation effects, is emphasized. (35 refs.)
- 114182** Stability of the radiation-induced γ' phase in 316 stainless steel. H.R.Brager, F.A.Garner (Hanford Engng. Dev. Lab., Richland, WA, USA). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.267-71 (June 1983).
- The γ' phase observed in AISI 316 is only stable during irradiation. It dissolves during annealing at the temperature of its formation in a manner which suggests that the dissolution rate is sensitive to the precipitate radius. The instability of this precipitate in the absence of irradiation confirms the expectation that this precipitate will exhibit a sensitivity to displacement rate. (13 refs.)
- 114183** Enthalpies of solution of some uni-univalent electrolytes in hexamethylphosphotriamide at 298.15K. M.Castagnolo, G.Petrella, A.Inglese, A.Sacco, M.Della Monica (Dept. of Chem., Univ. of Bari, Bari, Italy). *J. Chem. Soc. Faraday Trans. I (GB)*, vol.79, pt.9, p.2211-17 (Sept. 1983).
- Enthalpies of solution of various uni-univalent electrolytes in hexamethylphosphotriamide (HMPT) have been measured at 298.15K. Ionic enthalpies of transfer from water to HMPT and from HMPT to propylene carbonate (PC) were calculated on the basis of the assumption that the transfer enthalpy of the tetraphenylborate ion is the same as that of the tetraphenylarsonium ion. The results are compared with those of the same ions in other solvent pairs and discussed in terms of specific ion-solvent interactions. (24 refs.)
- 114184** Metastable phase separation in Au-Fe alloys. C.E.Violet, R.J.Borg (Lawrence Livermore Nat. Lab., Livermore, CA, USA). *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1073-6 (19 Sept. 1983).
- ^{57}Fe Mossbauer spectra at 4.2K of Au-Fe alloys with Fe concentration between 10.5 and 33 at.% are well described by two superposed six-line spectra. Presumably, these derive from two different chemical environments which are identified with the (420)-platelet and solid-solution phases. (22 refs.)

114185 On the gas absorption properties of rare-earth metals and their compounds. V.A.Latysheva, V.S.Mordyuk, A.T.Tokarev. *Svetotekhnika (USSR)*, no.8, p.5-6 (1983). In Russian.

A sorption capacity of a number of rare-earth metals and alloys has been found. They are compared with the commercially available getters. A zirconium-aluminum-samarium alloy and pure samarium are shown to possess a high sorption capacity. (3 refs.)

114186 Theory of inhomogeneous states of a solid solution in the neighborhood of second-order phase transitions. I.E.Dikhshtein, V.V.Tarasenko (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.272-6 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.482-9 (Feb. 1983). [received: Sept. 1983]

The precipitation of a single-phase two-component solid solution in finite samples is studied. The situation when a spatially periodic distribution of the concentrations of its components (modulated structure) occurs is considered. The case when the phase transition from a single-phase state of a solid solution to an inhomogeneous state is either a second-order phase transition or a first-order phase transition resembling a second-order transition is investigated. A rigorous thermodynamic theory free of any model assumptions on the nucleation of a structure with one-dimensional modulation is developed. The proposed theory is valid in the vicinity of phase transitions. All the quantities characterizing an inhomogeneous distribution of the concentrations and of elastic strains in a crystal are evaluated. The phase diagram of a solid solution in the coordinates of the temperature T and the average concentration \bar{c} of one of the components is constructed. It is shown that a phase transition from a homogeneous state to an inhomogeneous state is of second order in an interval of average concentrations bounded by \bar{c}_{1k} and \bar{c}_{2k} . Outside this interval, this phase transition is first order resembling a second-order transition. (16 refs.)

114187 Mechanism and kinetics of radiation-induced segregation in Ni-Si alloys. P.R.Okamoto, L.E.Rehn, R.S.Averback (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA), K.-H.Robrock.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.946-9

Rutherford backscattering and Auger chemical depth profiling measurements show that films of the γ -Ni₃Si phase produced on the ion bombarded surfaces of Ni-Si alloys obey simple parabolic growth kinetics. At low temperatures the film growth-rate constant exhibits Arrhenius behavior and varies with the fourth root of the dose-rate. The apparent activation energy in this low temperature region is ~ 0.3 eV. At high temperatures the growth constant is independent of the dose-rate. The results are consistent with a diffusion-controlled growth model, which assumes Si atoms migrate in the form of a fast diffusing Si-interstitial complex. (7 refs.)

114188 A HVEM study of radiation-induced segregation in dilute Ni-Be alloys. T.Mukai, T.E.Mitchell (Dept. of Metall. & Materials Sci., Case Western Reserve Univ., Cleveland, OH, USA).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.950-3

High voltage electron microscopy has been used for in-situ observations of precipitation in undersaturated solid solutions of Ni-1 at.% Be alloys under electron irradiation. The results show that the precipitation follows the normal ageing sequence of saturated solid solutions without irradiation: G.P. zones $\rightarrow \gamma'' \rightarrow \gamma'$. At the beginning of irradiation, the precipitation is homogeneously induced. Later on dislocation loops on {100} planes, having a (100) Burgers vector. Longer irradiations produce dislocation tangles containing precipitates. In thin specimen regions, however, faulted Frank loops form after {100}/{100} loops disappear. (5 refs.)

114189 Radiation-induced segregation at internal defect sinks in electron irradiated FCC alloys. S.Ohnuki, T.Takeyama, H.Takahashi (Metals Res. Inst., Hokkaido Univ., Sapporo, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.954-7

Radiation-induced segregation near internal defect sinks was investigated through the interaction between point defects and solute atoms in copper and nickel base alloys. Electron irradiation was performed in HVEM and solute concentration profile near grain boundaries and voids was measured by EDX. Oversize solute atoms depleted and undersize ones enriched at the sinks. The vacancy migration energy from loop growth rate was slightly higher in alloys containing oversize solute atoms than pure metals. The temperature dependence of the segregation showed a maximum value at $0.3-0.4 T_m$. These results indicate the evidence of two types of the interaction between defects and solute atoms, which is predominant in these temperatures. (12 refs.)

114190 Early stages of oxygen clustering and its influence on electrical behavior of silicon. G.S.Oehrlein (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), J.W.Corbett.

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.107-23

Knowledge of phenomena connected to the early stages of oxygen clusters, especially their electrical activity is reviewed. In addition to the well-known 450°C thermal donors, 'new oxygen donors', which occur in ca. 650°C annealing have emerged in conjunction with low temperature processing for VLSI and are discussed. The existing models of thermal donors are viewed as metastable oxygen clusters which lower the compressive strain of the surrounding silicon matrix via bonding of 2p oxygen lone pair orbitals. It is shown how this bonding can result in shallow double donor states. (102 refs.)

114191 Precipitation of oxygen and mechanism of stacking fault formation in Czochralski silicon bulk crystals. K.Wada, N.Inoue, J.Osaka (Musashino Electrical Communication Lab., NTT, Tokyo, Japan).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.125-39

Describes recent progress on nucleation and growth of oxide precipitates and stacking faults in Czochralski silicon. Conclusions on the growth kinetics of oxide precipitates are drawn from the experiments and analysis of growth kinetics of two-dimensional precipitates. The experimentally obtained growth kinetics, three-quarter power law is theoretically derived and the precipitate growth is demonstrated to be diffusion-limited by oxygen interstitials. The formation mechanism of stacking faults is the Bardeen-Herring mechanism. Based on the diffusional growth model, the growth kinetics of stacking faults are analyzed, assuming a coexistence of self-interstitial supersaturation and vacancy undersaturation. It is found that the growth is driven by vacancies in undersaturation. Vacancy component of self-diffusion has been determined and found to be predominant at low temperature. The possibility of the growth model proposed for increase of oxide precipitate density during annealing has been excluded. Both processes, homogeneous and heterogeneous nucleation, take place during annealing. (45 refs.)

114192 Carbon and the kinetics of oxygen precipitation in silicon. R.F.Pinizzotto, S.Marks (Central Res. Labs., Texas Instruments Inc., Dallas, TX, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.147-52

Oxygen precipitation in Czochralski silicon has been studied as a function of anneal time, oxygen concentration and carbon concentration using FTIR. It was found that the oxygen supersaturation controls the precipitation kinetics in high oxygen content samples, whereas the carbon concentration is of prime importance in low oxygen content samples. The decrease in substitutional carbon concentration after nucleation and its subsequent increase with extended growth anneals supports the view that carbon affects precipitate nucleation, but not precipitate growth. The measured oxygen solubility at 1000°C was found to depend on both the initial oxygen concentration and the initial carbon concentration. (17 refs.)

114193 Oxygen precipitation effects in degenerately-doped silicon. G.A.Rozgonyi (North Carolina State Univ., Raleigh, NC, USA), R.J.Jacodine, C.W.Pearce.

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.181-5

Reports preliminary observations of oxygen precipitation in degenerately-doped silicon using etching, optical microscopy and transmission electron microscopy. It was found that n+ material was resistant to precipitation, but p+ material precipitated readily. A multistep heat treatment starting with a low temperature step to achieve a high supersaturation ratio was successfully used to induce precipitation in n+ material. (5 refs.)

114194 Oxygen precipitation in silicon—its effects on minority carrier recombination and generation lifetime. C.J.Varker, J.D.Whitfield, P.L.Fejes (Semiconductor Res. & Dev. Lab., Motorola Inc., Phoenix, AZ, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.187-93

The effects of oxygen precipitation on the minority carrier recombination lifetime (τ_R) and the carrier generation lifetime (τ_G) have been characterized for a 'typical' silicon crystal grown with the Czochralski method. Infrared (IR) absorption measurements were obtained on polished wafers, before and after 2 step thermal anneals at 800°C and 1050°C to characterize the axial distribution of interstitial and precipitated oxygen in the ingot. Computerized measurements on NMOS diode and capacitor arrays were used to characterize the axial and radial distributions of carrier lifetime. The results indicate that oxygen precipitation is the dominant mechanism contributing to the degradation of both minority carrier recombination and generation lifetime. (19 refs.)

114195 Structural and chemical microanalysis of oxygen-bearing precipitates in silicon. R.W.Carpenter, I.Chan, H.L.Tsai (Center for Solid State Sci., Arizona State Univ., Tempe, AZ, USA), C.Varker, L.J.Demer.

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.195-9

Precipitation in CZ-silicon during post-growth two-stage heat treatment has been examined using the methods of high resolution analytical electron microscopy. Electron transparent specimens prepared from these specimens, exhibited a low density of plate type precipitates on {100} planes. Microdiffraction experiments showed the precipitates to be consistently non-crystalline. Electron energy loss spectra showed that the precipitates contained oxygen, but carbon was not detected. It was found that carbon artifact absorption edges could be induced in spectra by specimen contamination in the microscope. The use of a low temperature stage eliminated this problem. Complementary characteristic X-ray microanalysis showed that metallic impurities had not segregated to these precipitates in this particular case, although this has been observed elsewhere. (10 refs.)

114196 Crystalline particles in thermally grown silicon dioxide. F.A.Ponce, T.Yamashita (Materials Res. Labs., Hewlett-Packard Labs., Palo Alto, CA, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.201-5

Small crystalline particles in the vicinity of the Si/SiO₂ interface have been directly observed by high resolution transmission electron microscopy. These crystallites have typical diameters between 20 and 120 Å. Based on the observed interplanar spacings and angles in lattice images, the structure of these particles has been found to match those of cristobalite. Some orientation relationships also appear to exist between these particles and the silicon layer. (9 refs.)

64.80 OTHER PHASE PROPERTIES OF SYSTEMS

114197 Microstructural changes in vanadium pentoxide in controlled environments. P.L.Gai (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England). *Philos. Mag. A (GB)*, vol.48, no.3, p.359-71 (Sept. 1983). Direct observations have been made of the reduction of V_2O_5 between room temperature and $\sim 600^\circ\text{C}$ in reducing gases such as H_2 , balanced by He, CO and C_2H_4 , using a gas-reaction cell in a high-voltage electron microscope. The systematic study has revealed microstructural changes relevant to structural and catalytic properties of the system. The reduction of the surface begins at low temperatures of ~ 80 - 100°C . The defect structures formed are analysed, and it is shown that these are important in understanding redox reactions. The results could also perhaps explain chemical studies of oxygen desorption from V_2O_5 . (13 refs.)

114198 Tweed microstructures. I. Characterization in β -NiAl. I.M.Robertson, C.M.Wayman (Dept. of Metall., Univ. of Illinois, Urbana, IL, USA). *Philos. Mag. A (GB)*, vol.48, no.3, p.421-42 (Sept. 1983). The authors describe an electron microscopy investigation of an as-quenched 63 at.% Ni-Al alloy. This material exhibits strong tweed contrast and associated diffraction effects commonly called 'premartensitic effects'. Anomalous diffraction effects in martensite-forming β Hume-Rothery phases have been studied extensively, but the mottled microstructures have received little attention. This paper describes an attempt to characterize the microstructure systematically. In addition to some well-known characteristics, the authors have discovered that in many ways tweed contrast resembles the fringe contrast observed on stacking faults. This includes the variation of fringe spacing with foil orientation, with the extinction distance of the diffraction vector and with the deviation from the Bragg condition. Such behaviour provides a basis for understanding the origin of premartensitic effects in Hume-Rothery phases, and tweed microstructures in general. (30 refs.)

114199 Tweed microstructures. II. In several phases of the Ni-Al system. I.M.Robertson, C.M.Wayman (Dept. of Metall., Univ. of Illinois, Urbana, IL, USA). *Philos. Mag. A (GB)*, vol.48, no.3, p.443-67 (Sept. 1983). For pt.I see *ibid.*, vol.48, no.3, p.421 (1983). In this second in a series of papers on tweed microstructures in phases of the Ni-Al system, the authors describe the electron microstructure of the 3R and 7R martensites, the γ phase and the newly discovered Ni_3Al_3 phase in an alloy of average composition 63 at.% Ni-Al. The alloy was subjected to ageing treatments at temperatures ranging from 300 to 850°C for periods of up to 15 days, which resulted in the precipitation of the γ and Ni_3Al_3 phases from the supersaturated β phase. The metastable Ni_2Al phase has also been found to occur, and its effect on the tweed microstructure in the β phase is examined. The authors conclude that Ni_2Al precipitation is not the cause of tweed in β -Ni-Al. The cubic γ phase exhibits a tweed microstructure almost identical to that of the β phase. The tweed microstructures of the tetragonal 3R martensite and orthorhombic Ni_5Al_3 differ from those of the cubic phases in ways which reflect their different symmetries. These differences provide further clues to the origin of tweed microstructures. (29 refs.)

114200 Microstructure induced ordering effects in solids. K.Krishnan (Reactor Res. Centre, Tamil Nadu, India). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.891-4. It is shown that spatial and temporal ordering can arise due to point defect reactions with microstructure when a material is subjected to non-equilibrium conditions during radiation, quenching of strain rates. In particular the bias effect which causes random void growth is also responsible for void ordering in the presence of vacancy loops. Applications to other systems are also mentioned. (13 refs.)

114201 Electrically active defects in CID imaging arrays fabricated on $Hg_{0.7}Cd_{0.3}Te$. H.F.Schaaake, A.J.Lewis (Central Res. Labs., Texas Instruments Inc., Dallas, TX, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.301-5. CID imaging arrays were fabricated on $Hg_{0.7}Cd_{0.3}Te$ produced by the solid state recrystallization technique. It was found that the most serious source of dark current was sub-grain boundaries. SEM studies of the microstructure revealed by etching showed that boundaries with a high density of dislocations were detectable sources of dark current, while those boundaries with a low density of dislocations, as well as individual dislocations were not. TEM showed that all dislocations were free of precipitates, and most were not dissociated. The sub-grain boundaries were found to arise from misorientation between dendrites which form during the solidification from the melt. (10 refs.)

65.20 HEAT CAPACITIES OF LIQUIDS

114202 Electrostatic contribution to heat capacity of polyelectrolyte solutions. H.Daoust, P.Ferland, D.St.-Cyr (Dept. of Chem., Univ. de Montreal, Montreal, Quebec, Canada).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1563-6 (Aug. 1983).

An expression is derived for the electrostatic contribution to the heat capacity of a polyelectrolyte solution, with the help of the Lifson-Katchalsky cell model (1954) and Manning's infinite-line-charge theory (1969). The calculated values are compared with experimental values obtained for aqueous solutions of sodium-polyacrylate and sodium poly-L-glutamate. (17 refs.)

114203 Low temperature heat capacities of SrF_2 and other fluoride compounds. L.T.Ho (Inst. of Phys., Acad. Sinica, Taipei, Taiwan), D.P.Dandekar, J.C.Ho.

Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan), vol.12, p.10-17 (Dec. 1982). [received: Sept. 1983]

Heat capacity measurements between 2 and 22K have been made on SrF_2 , yielding a limiting value of Debye temperature $\Theta_D(0)=385\text{K}$. A brief review is then given, for various fluoride compounds XF_2 ($\text{X}=\text{Ba}$, Ca , Cd , Mn , Pb and Sr), on the general agreement between their $\Theta_D(0)$ values as determined from calorimetric measurements and those from elastic constant measurements, as well as on the general trend of deviations of their lattice heat capacity from a simple Debye behavior. (18 refs.)

114204 Specific heat of $\text{Li}_{0.27}\text{V}_2\text{O}_5$ bronze in the range 295-650K. S.E.Filippova, G.K.Demenskii, O.A.Teplov, L.A.Reznitskii (M.V. Lomonosov State Univ., Moscow, USSR).

Inorg. Mater. (USA), vol.18, no.9, p.1373-4 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Mater. Mater.*, vol.18, no.9, p.1597-8 (Sept. 1982). [received: Sept. 1983]

The authors have used DTA and true specific-heat methods to examine $\text{Li}_{0.27}\text{V}_2\text{O}_5$; the specimens were made by coulometric titration in electrochemical circuits with a lithium-bearing solid electrolyte: Pt , $\text{Li}_{0.26}\text{V}_2\text{O}_5\text{--yLi}^+|\text{Li}_{0.26}\text{V}_2\text{O}_5\text{--y}$, Pt ; $p(\text{O}_2)=10^{-1}\text{Pa}$, $T=830\text{K}$. The electrolyte was β -spodumene $\text{Li-AlSi}_3\text{O}_6$. The high mobility of Li^+ in $\beta\text{-Li}_x\text{V}_2\text{O}_5$ provided uniform distribution in the specimen. (3 refs.)

114205 Study of low temperature specific heat and DC electrical conductivity of NH_4Cl in pure powder form and in crystalline form grown from urea solution. S.S.Mitra, S.K.Ghorai, S.K.Dutta Roy (Cryogenic Engng. Centre, Indian Inst. of Technol., Kharagpur, India).

Indian J. Cryog., vol.8, no.1, p.52-6 (1983).

A continuous heating cryostat developed for the precision measurement of specific heats over the range 4K to 300K is described. The calibration data up to 77K with powdered NH_4Cl are presented and compared with previous measurements. Further measurements were carried on polycrystalline NH_4Cl , crystallised from 25% urea solution. The results were compared around the phase transition temperature (242K). DC electrical conductivity of single crystal NH_4Cl grown from urea was also studied. A large anomalous fluctuation in conductivity has been observed around the said transition temperature. The activation energy up to the transition temperature was found to be comparable to the data of Herrington and Staveland but differs considerably from the data on pure crystal grown by vapour deposition method. The role of incipient dissociation of urea in the single crystal of NH_4Cl has been discussed in the light of specific heat and electrical conductivity measurements. (9 refs.)

114206 Heat capacity of zinc oxysulfate from 7.5 to 309.4K with a transition from 270 to 306K. R.P.Beyer (Albany Res. Center, Bur. of Mines, US Dept. of the Interior, Albany, OR, USA).

J. Chem. Thermodyn. (GB), vol.15, no.9, p.835-40 (Sept. 1983).

The heat capacity of zinc oxysulfate ($\text{ZnO} \cdot 2\text{ZnSO}_4$) was measured from 7.5 to 309.4K by adiabatic calorimetry. A second-order transition was observed in the temperature range 270 to 306K with a peak at 279.2K. The values at 298.15K for $C_{p,m}$, $\{S_m^\circ(T) - S_m^\circ(0)\}$, $-\{G_m^\circ(T) - H_m^\circ(0)\}/T$, and $\{H_m^\circ(T) - H_m^\circ(0)\}$ are 246.86, 290.58, and 164.72 $\text{J.K}^{-1}\text{mol}^{-1}$, and 37.53 kJ.mol^{-1} , respectively. These properties are also reported from 5 to 1200K at convenient temperature intervals. (13 refs.)

114207 Thermodynamic properties and phase transitions of salt hydrates between 270 and 400K. II. $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ and $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$. F.Gronvold, K.K.Meisingset (Dept. of Chem., Univ. of Oslo, Oslo, Norway).

J. Chem. Thermodyn. (GB), vol.15, no.9, p.881-9 (Sept. 1983).

For pt.I see *ibid.*, vol.14, p.1083 (1982). Heat capacities and phase-transition enthalpies between 270 and 400K have been measured for commercial samples of sodium carbonate monohydrate and decahydrate by adiabatic-shield calorimetry. Enthalpies and entropies at selected temperatures have been derived for the exact stoichiometries. The molar enthalpy of transition of $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ to $(\text{Na}_2\text{CO}_3 + \text{aqueous solution})$ at 380.8K was found to be $(15.00 \pm 0.20) \text{kJ.mol}^{-1}$. The molar enthalpy of transition of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ to $(\text{Na}_2\text{CO}_3 \cdot 7\text{H}_2\text{O} + \text{aqueous solution})$ at 305.167 is $(48.2 \pm 0.6) \text{kJ.mol}^{-1}$. The molar enthalpy of transition of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ to $(\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O} + \text{aqueous solution})$ at 306.11K is $(67.1 \pm 0.5) \text{kJ.mol}^{-1}$. Lattice constants determined from Guinier photographs for $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ are $a=646.5$, $b=1072.0$,

and $c=525.0 \text{ pm}$ at 300K; for $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$: $a=1275.6$, $b=898.0$, and $c=1346.2 \text{ pm}$, and $\beta=122.66^\circ$ at 285K. Segregation of less-hydrated solid phases might be a problem for the use of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ as an energy-storage material. (24 refs.)

65.50 THERMODYNAMIC PROPERTIES AND ENTROPY

114208 Interpretation of the enthalpy in a discretised multidimensional region undergoing a melting/freezing phase change. V.R.Voller (School of Math., Thames Polytech., London, England).

Int. Commun. Heat & Mass Transfer (GB), vol.10, no.4, p.323-8 (July-Aug. 1983).

Theoretical justification is presented for relating the values of nodal enthalpy in a discretised region undergoing a melting/freezing phase change to the rate at which the change of state occurs. (7 refs.)

114209 Enthalpy-concentration data for the system ethanol-toluene. J.Wisniak (Dept. of Chem. Engng., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).

Indian J. Technol., vol.21, no.2, p.86-7 (Feb. 1983). [received: Sept. 1983]

Enthalpy-concentration data and boiling-composition correlations have been determined for the binary system ethanol-toluene at 760 mm Hg. This information should be useful for distillation studies and other processes in which the analytical relations between boiling (condensation) point and phase composition are required. (10 refs.)

114210 On the energy of interaction in the Si-B system. T.A.Chubnidze, A.L.Okley, M.A.Zhuruli.

Russ. Metall. (GB), no.3, p.175-8 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.199-201 (1982).

On the basis of the given values of the melting temperature, density and structure of boride SiB_4 , its thermodynamic functions and energy of interaction in the Si-B system as an approximation to regular solutions were calculated. The data obtained can be used in the theory of production and application for the deoxidation of metallic silicon alloys with boron. (5 refs.)

65.70 THERMAL EXPANSION AND THERMOMECHANICAL EFFECTS

(see also 64.30 Equations of state; for electronic thermal conduction, see 72.15 and 72.20; for thermal conductivity of superconductors, see 74.30E; for pyroelectric and electrocaloric effects, see 77.70)

114211 Thermal expansion of (Pd,Pt_{1-x})Fe alloys. S.M.Podgornykh, Yu.N.Tsiovin, N.I.Kourov, N.V.Volkenshtein (Inst. of Metal Phys., Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.403-6 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* Measurements of the thermal expansion coefficient were carried out on polycrystalline samples of ordered alloys with compositions in the range x=0-0.62. The magnetic component of the thermal expansion coefficient, defined as the difference between the experimental values and the Gruneisen function, was also found. The results indicated that the magnetic contribution to the thermal expansion was always positive and this was true of antiferromagnetic alloys of the system, ferromagnetic alloys, and those with intermediate compositions. (8 refs.) *A.T.*

114212 Negative thermal expansion due to the hindered rotation of the ammonium ion or the methyl group in solids with low barriers to rotation and the anisotropic thermal expansion in solids having polyatomic groups. D.Smith (Dept. of Chem., Pennsylvania State Univ., Hazleton, PA, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2995-3001 (15 Sept. 1983). The thermal expansion due to the hindered rotation of the ammonium ion or the methyl group is negative at liquid helium temperatures, if the tunneling frequencies of these polyatomic groups are greater than 0.3 cm⁻¹. Since the thermal expansion due to the hindered rotation of polyatomic groups with large tunneling frequencies is much greater than that due to the lattice vibrations at very low temperatures, the observed thermal expansion should also be negative. For barriers to rotation less than 500 cal/mol, the tunneling frequencies of NH₄⁺ and CH₃ are large enough to cause a negative thermal expansion. The thermal expansion due to hindered rotation of NH₄⁺ has been computed for NH₄⁺ in crystalline fields of trigonal, tetrahedral, and octahedral symmetry. Some noncubic ammonium compounds with relatively high barriers to rotation have been found to have a negative thermal expansion along one of their crystallographic axes. Expressions for the contribution to the thermal expansion from the hindered rotation of polyatomic groups are derived for tetragonal, hexagonal, and orthorhombic crystals. From these expressions, the probable source of the negative thermal expansion in one of the crystallographic directions in compounds such as NH₄ReO₄ and NH₄ClO₄ is deduced. (22 refs.)

114213 Some high-temperature properties of Zircaloy-oxygen alloys. L.R.Bunnell, J.L.Bates, G.B.Mellinger (Pacific Northwest Labs., Richland, WA, USA). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.219-32 (June 1983). The effect of oxygen on thermal expansion, elastic moduli, and thermal diffusivity of Zircaloy-4 nuclear reactor fuel cladding was determined for the main purpose of providing baseline data for LOCA evaluation codes. Measurements were made over the temperature range 298 to 1473K and 0.7 to 28 at.% oxygen. Expansion and moduli were measured in the two relevant directions, while diffusivity was measured in the principal heat transfer direction (through the clad). Thermal expansion and elastic moduli both increased with oxygen, while diffusivity decreased. Similar measurements were made on Zircaloy-2, but only to 5 at.% oxygen. Differences between the two alloys were within experimental error of the measurements made. (24 refs.)

114214 Thermal expansivity of oriented poly(ethylene terephthalate). C.L.Choy (Dept. of Phys., Chinese Univ. of Hong Kong, Hong Kong), M.Ito, R.S.Porter. *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.8, p.1427-38 (Aug. 1983). The linear thermal expansivity of poly(ethylene terephthalate) extruded at 50 and 90°C to extrusion ratios λ of 1-4.8 has been measured between 120 and 300K. With increasing λ, the expansivity along the extrusion direction (α_{||}) decreases sharply, while that in the transverse direction (α_⊥) shows a slight increase. For λ<3, the large drop in α_{||} and the accompanying increase in the axial Young's modulus E_{||} can be ascribed to chain alignment in the crystalline regions and to an increase in number and tautness of intercrystalline tie chains. At higher λ, however, the crystalline orientation apparently becomes saturated, so that taut tie molecules are solely responsible for further changes in both α_{||} and E_{||}. On the other hand, α_⊥ is mainly determined by crystalline orientation for all λ, thus showing very little increase at large λ. For the highly oriented samples (λ≥3), the Takayanagi model provides a reasonable description of the behavior of α_{||} and α_⊥. (22 refs.)

114215 Neutron and calorimetric observation of a modulated structure in quartz just above the α-β phase transition. C.M.E.Zeyen (Inst. Laue-Langevin, Grenoble, France), G.Dolino, J.P.Bachheimer. *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.280-2 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). At 573°C quartz undergoes a first order phase transition with symmetry breaking, around which many physical properties show important variations. Recently a new anomaly has been observed in the thermal dilatation just above T_{β-α}. As the possibility of an incommensurate phase has been predicted theoretically by Aslanyan and Levanyuk (1979), it was interesting to test whether the anomaly of thermal dilation corresponds indeed to such a phase. This experiment has been made by neutron diffraction at the ILL. Scans along the [001] direction revealed the existence, in a temperature interval of 1.3K above T_{β-α}, of incommensurate satellite peaks. Recently the authors have also repeated calorimetric measurements near T_{β-α} using the DSC technique and an anomalous behaviour of C_p well correlated with the thermal expansion data, is clearly observed. (13 refs.)

114216 Thermal expansion and electrical conductivity in the HfO₂-TiO₂ system. P.Odier, B.Cales, P.Etcheug, Vu Tien Loc (Centre de Recherche sur la Phys. des Hautes Températures, CNRS, Orleans, France). *Rev. Int. Hautes Temp. & Refract. (France)*, vol.20, no.1, p.45-54 (1983). Presents and comments on some of the data obtained for the thermal expansion of compounds in the system HfO₂-TiO₂. Results of X-ray crystallography are reviewed and macroscopic measurements of the thermal expansion are presented and explained using X-ray data and microstructural aspects of these compounds. Finally some results of electrical conductivity are analysed in terms of nonstoichiometry. (24 refs.)

114217 Nature of residual stresses in carbon fibre reinforced 12% silicon aluminium alloy. A.S.Viskov, V.K.Ivanov, B.E.Popov, E.V.Ufimtsev, V.I.Shulepov. *Russ. Metall. (GB)*, no.3, p.133-6 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.155-9 (1982). Carbon-reinforced aluminium obtained by soaking carbon fibres with molten 'Silumin', followed by subsequent cooling in water, contains residual stresses. The magnitude of these stresses is determined basically by thermal stresses which result from the different values of the coefficients of thermal expansion in the basic phases of the composite material. Phase stresses, which may arise in preparing carbon-fibre reinforced aluminium as a result of the formation of aluminium carbide and the dissociation of a supersaturated solid solution of silicon in aluminium, must play a secondary role because, under conditions of short-term dwell of the material at high temperatures followed by accelerated cooling, they have no time for significant development. (11 refs.)

114218 Dynamics of self-sustaining processes in solid matrices when heat evolution is triggered by stress. N.M.Biturin, V.N.Genkin, M.Yu.Myl'nikov (Inst. of Appl. Phys., Acad. of Sci., Gorki, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.600-1 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1395-8 (Nov. 1982). [received: Sept. 1983] The self-sustaining process involving heat evolution triggered by stresses due to nonuniform heating is analyzed in the small-strain approximation. The process initially propagates at an exponentially increasing velocity, and later at the speed of sound. (6 refs.)

65.90 OTHER TOPICS IN THERMAL PROPERTIES OF CONDENSED MATTER

114219 A useful integral function and its application in thermal radiation calculations. S.L.Chang, K.T.Rhee (Dept. of Mech. & Aerospace Engng., Rutgers Univ., New Brunswick, NJ, USA). *Int. Commun. Heat & Mass Transfer (GB)*, vol.10, no.4, p.329-33 (July-Aug. 1983).

A new integral function has been discovered. The present function is found to be useful in computing the spectral emissivity of an isothermal volume containing either soot or gaseous species, or both. Examples of its application are discussed herein. (11 refs.)

114220 Peculiarities of spectral emission of titanium during high-temperature oxidation. V.E.Liepinia, V.K.Mel'nikov. *Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.66-71 (1983). In Russian. The paper presents experimental results of a study of spectral emissivity of a titanium surface during chemical interactions with a low temperature plasma. The emissivity of surface changes according to the oxide film thickness in the temperature region up to 1400K. At temperatures of 1420-1600K during the process of chemical interactions of the metal surface with the plasma within the region of λ<2μ the metal emissivity exceeds that of the thermal emissivity which could be explained by chemiluminescence of titanium dioxide. (8 refs.)

66.00 TRANSPORT PROPERTIES OF CONDENSED MATTER (NONELECTRONIC)

66.10 DIFFUSION AND IONIC CONDUCTION IN LIQUIDS

114221 Self-diffusion of polyethyleneglycol molecules in concentrated solutions and melts. A.I.Maklakov, N.K.Dvoyashkin. *Vysokomol. Soedin. Ser. B (USSR)*, vol.25, no.6, p.424-7 (1983). In Russian. The selfdiffusion of polyethyleneglycol molecules in the aprotic solvents benzene, acetone, chloroform, and water and in melts is studied, and the coefficient of selfdiffusion D is measured by an NMR method with a pulsed magnetic field gradient. The relation between D and temperature in solutions of these solvents can be expressed by an Arrhenius type equation, D=D₀exp(-E_D/RT), where E_D is the activation energy for diffusion. The values of D and E_D depend on the solvent. No direct relation obtains between the selfdiffusion characteristics of polyethyleneglycol in solutions and the viscosity and selfdiffusion parameters of the solvents. For example, the values of D for pure benzene and water are close, and the coefficients of selfdiffusion for polyethyleneglycol in these solvents differ markedly. Also, the value of D for polyethyleneglycol in chloroform is less than for benzene although D for pure chloroform is higher than for benzene. (12 refs.) *N.S.*

114222 A conductance study of magnesium, manganese II and barium malonates in dioxane-water mixtures at 25°C. A.A.Al Najar, A.M.Ibrahim (Dept. of Chem., Coll. of Education, Univ. of Basrah, Basrah, Iraq). *Iraqi J. Sci.*, vol.22, no.4, p.466-90 (1981). [received: Aug. 1983] Conductances of solutions of magnesium, manganese II and barium malonates have been measured in dioxane-water mixture at 25°C. The experimental

data have been analyzed by the complete and expanded form of Fuoss-Hsia (F/H) as well as by Lee-Wheaton (L/W) equations. The conductance parameters derived from the analysis with these theories indicated that the equation of L/W reproduces the data more satisfactorily than the others. The low distance parameter values obtained show clearly the non-existence of solvent-separated ion-pairs. The plot of $\log K_A$ vs. $1/D$ show a concave downward curvature for all malonate salts. This association behaviour was discussed in terms of the interaction of the chelate salts with dioxane-water mixture systems. (16 refs.)

114223 Effect of concentration and ionic strength on the translational diffusion coefficient of Lysozyme. B.Nystrom, R.M.Johnsen (Inst. of Phys. Chem., Univ. of Uppsala, Uppsala, Sweden). *Chem. Scr. (Sweden)*, vol.22, no.2, p.82-4 (1983).

Photon correlation spectroscopy has been used to measure the translational diffusion coefficient (D) of lysozyme at pH 4.0 as a function of concentration and ionic strength. The lysozyme concentrations ranged from 5 to 80 kg m⁻³. At low ionic strengths D increases with concentration, whereas at high ionic strength (0.2M) D decreases with concentration. These features are discussed in terms of electrostatic interactions. (17 refs.)

114224 Comments on the diffusion behaviour in semidilute solutions of polystyrene at marginal solvent conditions. J.Carlfors, R.Rymden (Inst. of Phys. Chem., Univ. of Uppsala, Uppsala, Sweden), B.Nystrom. *Polym. Commun. (GB)*, vol.24, no.9, p.263-5 (Sept. 1983).

The concentration dependence of the diffusion coefficient in semidilute solutions of both low and high molecular weight samples of polystyrene ($1.1 \times 10^5 \leq M \leq 2.06 \times 10^6$) has been studied in a marginal solvent (2-butanone) by means of the classical diffusion technique. By comparing the results with those reported from quasi-elastic light scattering measurements on the same polymer/solvent system it is found that the diffusion coefficient in the semidilute regime depends on the time scale over which the measurement is made. Interpreting the results in terms of the pseudogel model, the indication is that the isothermal and adiabatic moduli are not equal. (23 refs.)

114225 Fused salt concentration cells with transference. Transport numbers of molten (Li,Ag)Cl and molten alkali iodide and silver iodide mixtures. J.Richter, E.Kirschbaum, H.Valenta (Inst. für Phys. Chem., RWTH, Aachen, Germany).

Z. Naturforsch. Teil A (Germany), vol.38A, no.8, p.880-4 (Aug. 1983). The transport numbers of the molten systems (Li,Ag)Cl, (Na,Ag)I, (K,Ag)I, and (Rb,Ag)I have been determined by e.m.f. measurements on concentration cells with transference. With the exception of (Na,Ag)I, for these systems the existence of inversion points (the mobility ratio reverses at a certain mixing ratio) is proven within experimental accuracy. For (Na,Ag)I an inversion point might exist at the high AgI concentration side. (5 refs.)

114226 Concentration dependence of the interdiffusion coefficients in molten alkali nitrate-silver nitrate mixtures. A.Hahne, J.Richter (Inst. für Phys. Chem., RWTH Aachen, Aachen, Germany).

Z. Naturforsch. Teil A (Germany), vol.38A, no.8, p.885-9 (Aug. 1983). To measure the composition dependence of the interdiffusion coefficients in molten mixtures of alkali nitrates and silver nitrate, a wave-front-shearing interferometer, together with an initial 'planes source' was used. With this technique, the diffusion coefficients were measured in nearly differential steps in the three mixtures (Na,Ag)NO₃, (K,Ag)NO₃, and (Rb,Ag)NO₃ at 300°C. The composition dependence of the diffusion coefficients D of all three systems could be described by parabolas of the form $D = a + bx_2 + cx_2^2$, where x_2 denotes the mole fraction of the silver nitrate. The three coefficients a , b , and c all show a clear proportionality to the radii of the alkali ions. Thus an extrapolation to the not measured systems (Li,Ag)NO₃ and (Cs,Ag)NO₃ was possible. (20 refs.)

114227 Conductivity of magnesium valerate solutions in binary liquid mixtures. S.N.Gour, U.Kumar (Dept. of Phys., DAV Coll., Muzaffarnagar, India), R.P.Varma.

Indian J. Pure & Appl. Phys., vol.21, no.7, p.398-400 (July 1983). Specific conductivity of magnesium valerate (soap) solutions in binary liquid mixtures has been studied. It is found that the soap aggregates into micelle and the CMC is independent of benzene, chlorobenzene and *p*-xylene concentrations in methanol and the temperature. The conductivity data fit well in the equation: $\log \lambda = A + B \log C$ where A and B are constants and C is the concentration of soap in mol. dm⁻³. Constant A increases with increase in temperature and methanol concentration in the mixture but the values of $-B$ are found independent. The soap is a weak electrolyte which dissociates below the CMC. Molecular conductivity at infinite dilution, λ_{∞} , dissociation constant (K), activation parameters of dissociation, ΔH° , ΔG° and ΔS° have been evaluated and the effect of composition of binary liquid mixtures has been discussed. (13 refs.)

114228 Observations upon the dynamic structure factor of interacting spherical polyelectrolytes. G.D.J.Phillips (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA).

J. Chem. Phys. (USA), vol.79, no.5, p.2325-32 (1 Sept. 1983). Experimental studies are reported on the light-scattering spectrum of 0.038 μ carboxylate-modified polystyrene latex spheres in deionized water. In concentrated suspensions, the long-time decay of the two-particle dynamic structure factor is given by a power law ($t^{-\alpha}$) form, not by a slow exponential. Non-linear least squares fits found $\alpha \approx 1.2$ -1.5, smaller values of α corresponding to higher sphere concentrations. The reduction of the mutual diffusion coefficient of 0.15 μ spheres in mixtures of 0.15 and 0.38 μ spheres was examined, and is interpreted in terms of the dynamic friction modification to the drag coefficients. Multiple scattering artifacts were shown to be absent with homodyne coincidence spectroscopy. (30 refs.)

114229 Translational diffusion in CH₄ and CH₂Cl₂ dissolved in cholesteric liquid crystals. M.E.Moseley, R.Poupko, Z.Luz (Weizmann Inst. of Sci., Rehovot, Israel).

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.279-85 (1983). Translational diffusion coefficients of CH₄ and CH₂Cl₂ dissolved in five cholesteric mixtures of alkylcyanobiphenylhexane-cholesterylchloride were measured in the temperature range 25°C to 75°C, using the NMR pulse gradient spin echo method. The pitch of the solvents studied depends on the cholesterylchloride concentration and ranged between ∞ and 2.2 μ . The results indicate a slight difference in the diffusion constant parallel (D_{\parallel}) and perpendicular (D_{\perp}) to the cholesteric pitch axis, with $D_{\parallel}/D_{\perp} \approx 1.1$. The Arrhenius activation energies for the diffusion constants are about 6 to 7 kcal/mole for both probes. No dependence of the diffusion coefficients on the cholesterylchloride concentration and thus on the pitch was observed. (11 refs.)

114230 Self-diffusion coefficients of cholesteric/nematic systems with dynamic mass transport method. H.Hakemi (Dept. of Chem., Duke Univ., Durham, NC, USA).

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.309-22 (1983). Dynamic approach to mass transport study in cholesteric/nematic systems by the optical method provides the evaluation of the self-diffusion coefficients of

both solute and solvent. These values are obtained by extrapolating to the $C=0$ and $C=1$ limits from the scaling law found between the diffusion coefficient and the concentration gradient. The numerical values of the local concentrations are obtained from the pitch values in both homogeneous and homeotropic boundary conditions. (17 refs.)

114231 Diffusion coefficient of a binary stratifying system along the coexistence curve. N.I.Chernova, S.V.Kazakov, F.El Mekawey (Dept. of Molecular Phys., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.110-13 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.94-6 (1982). The results of investigating the diffusion coefficient in the nitrobenzene-heptane system along the coexistence curve are presented. The parameters of the temperature and concentration dependences of diffusion are measured. It is shown that the character of the singularity in the diffusion coefficient as a function of the concentration is due to the properties of the coexistence curve. (9 refs.)

114232 The characteristics of salt fingers in a variety of fluid systems, including stellar interiors, liquid metals, oceans, and magmas. R.W.Schmitt (Woods Hole Oceanographic Instn., Woods Hole, MA, USA).

Phys. Fluids (USA), vol.26, no.9, p.2373-7 (Sept. 1983). The growth rates, flux ratios, wavenumbers, and bandwidths of salt fingers are computed for Prandtl numbers from 10^{-7} to 10^4 and diffusivity ratios from 1 to 10^8 using the exact similarity solutions of Schmitt [Deep-Sea Res. 26A, 23 (1979)]. This model successfully explains the variation in flux ratio in the heat/salt and salt/sugar systems and produces salt-finger spectra in agreement with ocean observations. The calculations presented should be useful in the study of double diffusion in astrophysics, chemistry, geology, metallurgy, meteorology, and oceanography, and may be applicable to problems in the growth of semiconductor crystals. (19 refs.)

114233 Electrolyte solutions near the critical point of water: a review and proposal for studies under microgravity conditions. D.J.Turner (Central Electricity Res. Labs., Leatherhead, England).

Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.393-400

All ions in a solution exert a compressional influence on the solvent molecules in their vicinity. When a solvent has a high compressibility, as it will near its critical point, the effect is expected to be very large, especially at low concentrations. These expectations are born out in practice in measurements of apparent molal volumes, molal compressibilities and heat capacities of ions in water. Reported data on these properties and on conductance are reviewed for NaCl solutions along the SVP curve and in a supercritical fluid just above the critical point. They are rationalized using a simple two state model which treats the solvent as either fully compressed by the ions or as free solvent. A proposal is outlined for a conductance study on aqueous NaCl solutions at a temperature just below critical. A description is given of the conductance equipment being developed for use in a Texus flight and of the objectives of the first experiment planned. (27 refs.)

(inc. viscosity of liquids)

114234 Viscoelastic properties of linear low density polyethylene melts.

D.R.Saini, A.V.Shenoy (Chem. Engng. Div., Nat. Chem. Lab., Pune, India). *Eur. Polym. J. (GB)*, vol.19, no.9, p.811-16 (1983).

The importance of linear low density polyethylene (LLDPE) is being rapidly felt. The combination of favourable production economics and excellent product performance characteristics has enabled this new plastic to gain acceptance for a wide variety of applications. No studies on the rheological properties of LLDPE exist to date. The viscous and elastic properties of this new polymer has now been investigated and unified curves for viscosity and normal stress differences are given. The temperature dependence of the rheological properties of LLDPE has also been studied. (22 refs.)

114235 Structure of water solutions. I. Viscosities of aqueous substituted ammonium chlorides. R.Bhanumathi, S.K.Vijayalakshamma (Dept. of Inorganic & Phys. Chem., Indian Inst. of Sci., Bangalore, India).

J. Electrochem. Soc. India, vol.32, no.1, p.11-15 (Jan. 1983). [received: Sept. 1983]

Relative viscosities of methyl, ethyl and benzyl ammonium chlorides are measured at three temperatures 35°C, 45°C, 60°C. The data at low concentration is analysed using the Jones-Dole equation. B_+ coefficients are obtained using the method of Sacco (1981) ($B(BPh_4^-) = B(PPh_4^+)$). The temperature dependence of B_+ coefficients indicates structure forming tendency in all three cases and no ion-ion association. The viscosity data is also analysed using Vand's treatment (1948) and Breslau and Miller's treatment (1970) at higher concentration. Breslau-Miller's V_e values show a linear negative dependence on concentration thus agreeing with the conclusion that no ion-ion associate is present till 1 M. The volume obtained from the various treatments are compared with van der Waals volume calculated from X-ray data. The interaction constant K of Vand's treatment decrease with temperature in all cases probably indicating structure-forming tendency. (18 refs.)

114236 Pressure dependence of the viscosity of dilute polystyrene solutions in toluene. S.Claesson, J.L.McAtee, Jr., S.Ali (Dept. of Chem., Baylor Univ., Waco, TX, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1873-81 (Sept. 1983). The effect of pressure on the viscosity of dilute solutions of anionically polymerized polystyrene ($M_w = 209000$; $M_w/M_n = 1.12$) in toluene has been studied at different temperatures and concentrations using a falling-body viscometer. Measurements were performed in the concentration range from 0.0025 to 0.2 g/mL and at temperatures from 25 to 45°C under pressure up to 1057 bars. The viscosity coefficient η increases exponentially with pressure at a given temperature and concentration, while the apparent volume of activation V^\ddagger decreases with increasing temperature. The hypothesis that the pressure dependence of η is given by the pressure dependence of the activation energy holds true under the prevailing thermodynamic conditions. Log η increases linearly with increasing concentration at a given pressure. Intrinsic viscosity increases with increasing pressure, whereas the Huggins constant decreases. (40 refs.)

114237 Elongation rheology of polyolefins and its relation to processability. D.H.Sebastian (Dept. of Chem. & Chem. Engng., Stevens Inst. of Technol., Hoboken, NJ, USA), J.R.Dearborn. *Polym. Eng. & Sci. (USA)*, vol.23, no.10, p.572-5 (July 1983). The rheology of a variety of polyolefin resins, and resin blends, has been examined under conditions of constant strain rate elongation. These include high, low, and linear low density polyethylene, as well as polypropylene, commercially modified polypropylene, and elastomer blends with polypropylene. Two distinctly different classes of behavior are apparent in the viscosity growth patterns during uniaxial extension. Some resins display unbounded stress growth even at low strain rates. Others quickly attain a time independent value of extensional viscosity even at increased strain rates. The former behavior is identified with favorable blow molding behavior, while the latter was characteristic of resins unsuitable for such processing. The class of elongation behavior depends not only on resin type, but may be influenced by molecular weight distribution or blend morphology. (5 refs.)

114239 Ion-induced diffusion and surface segregation. K.Morita (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan), H.Shimizu. *J. Vac. Soc. Jpn. (Japan)*, vol.26, no.2, p.88-98 (1983). In Japanese. Discusses the effect of ion irradiation on compound material from the standpoint of surface thermodynamics, surface segregation and ion-induced diffusion. The topical areas include: (1) segregation models—Fowler-Guggenheim model and Langmuir-McLean model, (2) two-dimensional phase diagram, (3) irradiation-induced diffusion and grain-boundary diffusion, and (4) ion-induced diffusion and surface segregation in ion beam processing for semiconductor-device fabrication. (47 refs.) *K.B.*

114240 Phenomenological coefficients for atom transport in dilute interstitial solid solutions. Y.Ökamura, A.R.Allnatt (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada). *Philos. Mag. A (GB)*, vol.48, no.3, p.387-96 (Sept. 1983). The phenomenological coefficients, in the form of flux equations suggested by the thermodynamics of irreversible processes, are calculated for two dilute interstitial species for models in which binding between nearest-neighbour interstitials occurs. Linear-response formulae for the coefficients are analysed by an extension of the matrix method of random-walk theory familiar in the calculation of impurity correlation factors. The terms correct to first order in the concentrations of paired and unpaired species are calculated exactly. The origin of the close relationship in structure between results for this model and results for a model of a dilute binary alloy with the vacancy mechanism is traced through the steps of the calculation. (11 refs.)

114241 The role of vacancies in grain boundary motion. Y.Estrin (Tech. Univ. Hamburg-Harburg, Hamburg, Germany), K.Lucke, G.Gottstein. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.773-5. Grain boundary motion (GMB) by transfer of individual atoms across the grain boundary (GB) is considered. Competing models of GBM, different as to the role of vacancies in the elementary effect of boundary displacement, are analyzed. Qualitative differences in the predictions of these models provide a basis for experimental identification of the operating mechanism of GBM. (7 refs.)

114242 Self-diffusion of carbon in Ti-C alloys. V.S.Zotov, V.I.Sukharev. *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.410-13 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* Alloys of titanium containing up to 2.0 at.% were investigated using radioactive carbon (¹⁴C). At low carbon concentrations an increase in the amount of carbon reduced the diffusion coefficient, but at higher concentrations the carbon content had no effect. (17 refs.) *A.T.*

114243 Lateral self-diffusion in indium thin films. J.J.B.Prasad, K.V.Reddy (Dept. of Phys., Indian Inst. of Technol., Madras, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.7, p.391-4 (July 1983). Lateral self-diffusion has been studied in indium thin films. A thin-film sample with a well defined radioactive region in the middle was prepared by neutron activation technique. An experimental set-up was fabricated to scan the concentration of the radioactive indium in the sample. A non-linear fitting procedure was employed to determine the self-diffusion coefficient from the experimental data. The diffusion data obtained in the temperature range 93-145°C could be fitted to the equation $D=0.22 \exp (-0.60/kT)$. The thin-film data were compared with the available data on bulk indium. A grain boundary diffusion mechanism has been concluded for the lateral self-diffusion in indium thin films in the temperature range studied. (13 refs.)

114244 Fast interstitial-solute complex diffusion under irradiation in Cu/Be. H.-J.Gudlart, V.Naundorf, M.-P.Macht, H.Wollenberger (Hahn-Meitner-Inst. fur Kernforschung Berlin GmbH, Berlin, Germany). *J. Nucl. Mater. (Netherlands)*, vol.118, no.1, p.73-7 (Aug. 1983). Diffusion of beryllium in copper has been investigated under self-ion irradiation at temperatures between 295K and 700K. After irradiation Be was found in the initially Be free zone far outside the region damaged by irradiation. This observation is interpreted by long range diffusion of highly mobile interstitial Be complexes. (10 refs.)

114245 Solute-enhanced self-diffusion. On the validity of the Howard-Manning theory. S.Ishioka, M.Koiwa, H.Nakajima (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *Philos. Mag. A (GB)*, vol.48, no.3, p.341-58 (Sept. 1983). The Howard-Manning theory of the effect of solutes on solvent self-diffusion is examined critically. A model problem (the diffusion of a random walker on an imperfect lattice with a regular array of blocked sites), which can be solved rigorously, is solved by the Howard-Manning approach. A comparison of the results obtained by both rigorous and approximate methods throws light on the validity of the approximations. It is concluded that a more extensive calculation is required when the vacancy jump frequencies in the vicinity of an impurity are very much different from that at normal sites. (5 refs.)

114246 Investigation of vacancy diffusion in niobium, molybdenum, and tantalum by means of high-voltage electron microscopy. F.Phillipp, B.Saile, K.Urban (Max-Planck-Inst. fur Metall., Stuttgart, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.261-4. The growth of interstitial dislocation loops during high-temperature irradiation was investigated in Nb, Mo and Ta by means of high-voltage electron microscopy. The growth rate is at temperatures higher than 420K (Nb), 600K (Mo) and 550K (Ta) independent of irradiation time. This provides direct evidence for the onset of long-range vacancy migration at the indicated temperatures. The loop growth rate is found to be proportional to P^n where P is the defect production rate and $0.7 \leq n \leq 0.8$. This indicates that the rate of mutual recombination and that of the annihilation of point defects at sinks are of comparable order of magnitude. Employing an extended rate equation description of damage formation in which the formation of submicroscopic vacancy clusters is taken into account, a good fit to the quantitative results can be achieved. The activation enthalpies for vacancy migration thus obtained are (0.95±0.15)eV for Nb, (1.3±0.2)eV for Mo and (1.1±0.2)eV for Ta. (9 refs.)

114247 Vacancies in zinc and cadmium produced by proton- and electron-irradiation. R.Seeboeck, W.Engel, S.Hoth, R.Keitel, W.Witthuhn (Phys. Inst., Univ. Erlangen-Nurnberg, Erlangen, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.271-3. The annealing behaviour of lattice defects in Zn and Cd was investigated by the PAC-method. The defects were produced by proton- and electron-irradiation and by quenching. The experiments clearly show that in annealing stage III in Zn and Cd, vacancies are migrating freely. (21 refs.)

66.30H Self-diffusion and ionic conduction in nonmetals

114248 Electrical conductivity measurements of some layered magnetic structures. C.P.Tigges, J.E.Drumheller, L.O.Snively (Dept. of Phys., Montana State Univ., Bozeman, MT, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.5473-5 (Sept. 1983). The electrical conductivity for temperatures up to 416K has been measured in several of the alkylammonium tetrahalidemetallates and the alkanediammonium tetrahalidemetallates where the halides were bromine and chlorine and the metal was copper or, in one case, cadmium. These salts are all good magnetic insulators at low temperature but behave as ionic, probably protonic, semiconductors as the temperature is increased. Room temperature conductivity for these samples is of order $10^{-12} \Omega^{-1} \text{ cm}^{-1}$ and varies as much as ten orders of magnitude over the measured temperature range. The possibility that the changes in activation energy are related to known structural phase transitions is discussed. (12 refs.)

114249 Diffusion of long chain n-alkylammonium cations in layer compounds (*n*-C_nH_{2n+1}NH₃)₂MCl₄. V.Busico, M.Vacatello (Istituto Chimico, Univ. di Naples, Naples, Italy). *Mol. Cryst. & Liq. Cryst. (GB)*, vol.95, no.3-4, p.251-69 (1983). Evidence for long range, anisotropic diffusion of the long chain *n*-alkylammonium cations in layer compounds (*n*-C_nH_{2n+1}NH₃)₂MCl₄ is presented. Annealing mechanical mixtures of such compounds with $M=\text{Mn}$, Zn; $n=12$, 18 results in the formation of mixed crystals of composition (*n*-C₁₂H₂₅NH₃)_{2x(12)} (*n*-C₁₈H₃₇NH₃)_{2-2x(12)}MCl₄ in which bilayers of *n*-alkylammonium groups with differing chain lengths, positionally and conformationally disordered, alternate with crystalline metal halide layers (modification β'). When the ionic layers are polymeric ($M=\text{Mn}$), solid solutions are obtained on cooling from modification β' in which the polymethylenic chains

of the alkylammonium groups, while maintaining positional disorder, are partly cocrystallised in spite of the high difference in chain length (modification α'). Demixing into the pure components, on the other hand, is observed on cooling for nonmacroanionic systems ($M=Zn$). Possible structural models of the mixed compounds in modifications α' , β' are described, and the stability of such modifications relative to the unmixed components evaluated on the basis of a simple thermodynamical treatment. (26 refs.)

114250 Structure and dynamics of disordered solids: a neutron scattering study of $Ba_{1-x}La_xF_{2+x}$. J.K.Kjems, N.H.Andersen, J.Schoonman (Riso Nat. Lab., Roskilde, Denmark), K.Clausen. *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.357-61 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).

Single crystals of the fluorite-type solid solutions $Ba_{1-x}La_xF_{2+x}$, $x=0.209$ and $x=0.492$, show strong anisotropic diffuse neutron scattering which is quantitatively explained in terms of simple models involving defect clusters of the 222 type. The concentrated sample shows additional evidence for short range correlations between such clusters which tend to form larger, roughly linear aggregates. The aggregates dissociate at temperatures above 500°C. The implications for the conduction mechanism are discussed. (7 refs.)

114251 Direct evidence of diffusion of self-interstitials in silicon. G.Das (IBM General Technol. Div., East Fishkill, NY, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.87-93.

High temperature (1200°C) HCl oxidation treatment has been employed to float-zone (FZ) silicon wafers (625 μ m thick) containing swirl defects in order to study their diffusion characteristics. In treated wafers, swirl defects can be eliminated from both surfaces up to a depth of ~ 30 μ m. In the bulk of the wafers, however, large swirl defects (A-swirls) rearrange themselves into many small defects. The untreated portions of wafers contain large swirl defects (A-swirls) that extend up to both surfaces. Since swirl defects are primarily clusters of silicon self-interstitials, their rearrangement in the bulk and elimination from the surfaces demonstrate that migration of interstitials takes place on a large scale and is not confined to SiO_2 /silicon interface only. The above observations appear to provide direct evidence for the dominant role of self interstitials for diffusion mechanism in silicon at high temperature and can be rationalized in terms of an interstitially mechanism. Alternatively, however, dominance of interstitials can be related to a higher migration energy of vacancies proposed in a model where both species coexist at high temperature. The preference of one model over another must await theoretical calculations of diffusion energetics derived from both models. (22 refs.)

114252 Self-diffusion in compound semiconductors. A.F.W. Willoughby (Engng. Materials Labs., Univ. of Southampton, Southampton, England). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.237-52.

Self-diffusion studies are vital in the elucidation of atomic mechanisms of diffusion, as well as in the better understanding of device fabrication processes, such as the annealing of ion-implanted layers. This review outlines first the major reasons for interest in self-diffusion in III-V and III-VI compounds. It discusses the main differences with elemental semiconductors, including the wide variety of possible defects in the compounds, the role of departures from stoichiometry, and the value of tracer and interdiffusion studies. Self-diffusion studies in III-V compounds are reviewed, including recent measurements in GaAs, where more information on diffusion mechanisms is becoming available. Interdiffusion between different III-V compounds is also discussed in the light of self-diffusion studies. Recent progress on self-diffusion in certain II-VI compounds is discussed, where interdiffusion studies have also provided a significant contribution. The review concludes by suggesting areas where research is urgently needed to clarify diffusion mechanisms. (40 refs.)

114253 Incoherent light-induced diffusion of arsenic into silicon from a spin-on source. V.E.Borisenko, A.Nylandsted Larsen (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).

Appl. Phys. Lett. (USA), vol.43, no.6, p.582-4 (15 Sept. 1983). A new approach to impurity diffusion in semiconductors based on the use of a spin-on source and short-time incoherent light exposure has been developed and experimentally investigated for arsenic diffusion into silicon. Arsenic-doped oxide films, ~ 0.19 μ m thick, were spin-on deposited onto (100) oriented silicon crystals and heated with radiation from a xenon lamp to temperatures between 950 and 1200°C for times of 10 and 25 s. Arsenic diffused layers tested with resistivity measurements and Rutherford backscattering analysis were characterized by a maximum surface concentration $\sim 1 \times 10^{20}$ atom/cm³ and a maximum depth ~ 0.40 μ m. (19 refs.)

114254 Double zinc diffusion fronts in InP—theory and experiment. M.Yamada, P.K.Tien, R.J.Martin, R.E.Nahory, A.A.Ballman (Bell Telephone Labs., Holmdel, NJ, USA).

Appl. Phys. Lett. (USA), vol.43, no.6, p.594-6 (15 Sept. 1983). Diffusion of Zn or Cd in *n*-type III-V material has been extensively used for forming *p-n* junctions in lasers and detectors. However, if the substrate material used for diffusion has an electron concentration less than 5×10^{16} cm⁻³, two separate diffusion fronts will appear which alter completely the electrical property of the junction. The authors have investigated this phenomenon by electron beam induced current (EBIC) and secondary ion mass spectroscopy (SIMS). A theory is proposed, for the first time, in good agreement with experiment. (7 refs.)

114255 Effect of thermal nitridation processes on boron and phosphorus diffusion in (100) silicon. P.Fahey, R.W.Dutton, M.Moslehi (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA).

Appl. Phys. Lett. (USA), vol.43, no.7, p.683-5 (1 Oct. 1983). The effect of the silicon thermal nitridation processes, nitridation of SiO_2 (oxynitridation), and direct nitridation of the silicon surface on boron and phosphorus diffusion is examined. It is found that oxynitridation results in enhanced diffusion of both impurities while direct nitridation of the silicon surface causes retarded diffusion for both. These phenomena are explained by the mechanisms of silicon self-interstitial injection in the case of oxynitridation and self-interstitial depletion in the case of direct nitridation. (13 refs.)

114256 Asymmetry of the permeability of multilayer films. F.A.Makhmutov, V.G.Nazarov, V.K.Belyakov, V.N.Manin. *Vysokomol. Soedin. Ser. B (USSR)*, vol.25, no.6, p.387-91 (1983). In Russian.

The conditions for the attainment of high values of the permeability asymmetry of multilayer polymer films are studied with the aid of a model for explaining and predicting the values of the permeability asymmetry for multilayer polymer films on the basis of an analysis of the concentration relations for the permeability of individual layers, and with special reference to the permeability of various homopolymers and copolymers, e.g. of the vinyl chloride-vinyl acetate and ethylene-vinyl chloride systems with various ratios of the monomer linkages, and also of polyvinyl alcohol and hydrated cellulose systems with various degrees of cyanethylation and acetylation, with respect to *n*-heptane and methanol. (8 refs.) N.S.

114257 The effects of defect character on hydrogen diffusion in metals. C.N.Park, J.-Y.Lee, G.W.Hong (Dept. of Materials Sci. & Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.475-9 (Sept. 1983). The hydrogen diffusion flux equations are established considering trap characteristics and their effects on apparent diffusivity is analysed; the effect of shape—spherical (vacancy, substitutional atom and microvoid), cylindrical (dislocation) and spherical skin (grain boundary)—density, size of defects and temperature are examined. (9 refs.)

114258 Marker experiments for diffusion in the silicide during oxidation of $PdSi$, Pd_2Si , $CoSi_2$, and $NiSi_2$ films on (Si). M.Bartur, M.-A.Nicolet (California Inst. of Technol., Pasadena, CA, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5404-15 (Sept. 1983). Inert markers (evaporated tungsten and ion implanted xenon) were used to investigate the mass transport through a silicide layer on a (Si) substrate during thermal oxidation at 700-900°C. The SiO_2 growth from $PdSi$, Pd_2Si , $CoSi_2$, and $NiSi_2$ films on (Si) is a process limited by the diffusion of the oxidant from the ambient gas to the silicide/oxide interface. Possible diffusion processes through the silicide that supply Si to the growing SiO_2 layer, but keep the silicide stoichiometry intact, are discussed. Backscattering spectrometry is used to monitor the marker position in the silicide layer. The authors find that the diffusing species during oxidation correlate with the moving species during silicide formation. (18 refs.)

114259 Effects of back-side oxidation of Si substrates on Sb diffusion at front side. S.Mizuo, H.Higuchi (Hitachi Ltd., Central Res. Lab., Kokubunji, Tokyo, Japan).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1942-7 (Sept. 1983). The effect of back-side oxidation of Si wafers on the diffusion of Sb in the front of wafers is investigated with back-side selective oxidation (BSO) at 1100°C in dry O_2 ambients. It is found that the diffusion of Sb in the front of the wafers is retarded by BSO only for FZ Si substrates under directly formed Si_3N_4 films, and that Sb diffusion in CZ Si substrates and under double-layered SiO_2 - Si_3N_4 films in both FZ and CZ substrates is not affected by BSO. The effective range over which BSO affects Sb diffusion is found to increase with oxidation time. The range and extent of oxidation retarded diffusion (ORD) for Sb are shown to agree with those of oxidation enhanced diffusion (OED) for B and P. These results are explained with a proposed model: (i) there is a thermal equilibrium between vacancies and interstitials, and (ii) the Si- SiO_2 interface provides sinks and generation centers for point defects in Si, though the Si- Si_3N_4 interface does not react with point defects. (25 refs.)

114260 Diffusivity of tritium in Li-Al alloys. M.Nakashima, M.Saeki, Y.Arakono, E.Tachikawa (Div. of Chem., JAERI, Tokai, Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.141-6 (June 1983). The diffusion coefficients of tritium in Li-Al alloys were measured. The observed diffusion coefficients were expressed by the following equations: $D = 8.5 \times 10^{-5} \exp[-43.9 \pm 14.8 (kJ/mol)/RT]$ (cm²/s), $D = 9.3 \times 10^{-5} \exp[-48.5 \pm 15.0 (kJ/mol)/RT]$ (cm²/s), and $D = 5.3 \times 10^{-5} \exp[-62.7 \pm 13.8 (kJ/mol)/RT]$ (cm²/s) for 0.02, 0.26 and 1.12% Li-Al alloys, respectively. Results showed that the diffusion coefficients as well as the apparent activation energy for diffusion depend upon the lithium concentration in the alloy. (13 refs.)

114261 Diffusion of tritium in single crystal Li_2O . D.Guggi, H.R.Ihle, D.Bruning, U.Kurz (Inst. für Chem., Kernforschungsanlage Jülich GmbH, Jülich, Germany), S.Nasu, K.Noda, T.Tanifuji.

J. Nucl. Mater. (Netherlands), vol.118, no.1, p.100-8 (Aug. 1983). The release of tritium from neutron irradiated spherical samples of single crystal Li_2O was measured by isothermal annealing experiments. The release is shown to be controlled by diffusion of tritium in the solid under appropriate experimental conditions. Deviations from solely diffusion controlled release were observed when traces of water were present in the He-purge gas used in the experiments. The diffusivity of tritium in single crystal Li_2O is given by $\ln(D/cm^2 s^{-1}) = -(5.93 \pm 0.48) - (81.73 \pm 4.24) 10^3/RT$ for $850K < T < 1200K$ ($R = 8.314 J K^{-1} mol^{-1}$). (20 refs.)

114262 Tests of a free-volume model for the permeation of gas mixtures through polymer membranes. CO_2 - C_2H_4 , CO_2 - C_3H_8 , and C_2H_4 - C_3H_8 mixtures in polyethylene. S.A.Stern, G.R.Mauze (Dept. of Chem. Engng. & Materials Sci., Syracuse Univ., Syracuse, NY, USA), H.L.Frisch. *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.8, p.1275-98 (Aug. 1983). Steady-state permeability coefficients have been measured for equimolar mixtures of CO_2 - C_2H_4 , CO_2 - C_3H_8 , and C_2H_4 - C_3H_8 , as well as for a mixture of

74.9 mol.% CO₂ and 25.1 mol.% C₂H₄ in polyethylene membranes. The measurements were made at 20, 35, and 50°C and at pressures of up to 28 atm. Each component of the permeating mixtures studied had the effect of increasing the permeability coefficient for the other component. Furthermore, at equal partial pressures and at the same temperature, the component exhibiting the highest solubility in the polymer had the largest effect in increasing the permeability coefficient of the other component. This behaviour is in agreement with the predictions of a free-volume model for the permeation of gas mixtures proposed by Fang, Stern, and Frisch (see J. Polym. Sci. A-2, vol.10, p.201, 1972). From a quantitative viewpoint, the permeability coefficients for the components of the mixtures agreed, on the average, to better than 25% with the predicted values. The theoretical permeability coefficients can be estimated from the model by using parameters determined with the pure components only. (21 refs.)

114263 Diffusion of iodine into PE and PET. L.F.Pender, H.-B.Mak, H.J.Wintle (Dept. of Phys., Queen's Univ., Kingston, Canada). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.9, p.1635-46 (Sept. 1983). The Rutherford backscattering technique is very useful for studying the kinetics of diffusion processes in polymers. The diffusion of iodine into low-density polyethylene (LDPE) was measured by optical absorbance and by Rutherford backscattering. The optical results appear to be normal, and show no electric field dependence, but the backscattering results reveal that this is misleading, because there is fast diffusion in the bulk accompanied by large surface concentrations of iodine. PET was studied by the backscattering technique, and in this case the behavior corresponds to a weakly concentration-dependent diffusion coefficient with no observable surface effects. Neither set of results gives support of the domain theories of low-frequency electrical oscillation in these materials. (51 refs.)

114264 The effect of micro-structure on the diffusion of n-hexadecane and DDT in poly(1,4-butadienes). R.B.Jenkins, G.S.Park (Dept. of Appl. Chem., Univ. of Wales Inst. of Sci. & Technol., Cardiff, Wales). *J. Membrane Sci. (Netherlands)*, vol.15, no.2, p.127-40 (Sept. 1983). Diffusion coefficients of the large inflexible DDT molecule [1,1-bis(4-chlorophenyl)-2,2,2-trichloroethane] and of the long flexible n-hexadecane molecule have been obtained in various polybutadienes using ¹⁴C labelled molecules and the thin smear surface activity method at temperatures of 25, 35 and 45°C. In all cases, the diffusion coefficients decrease slowly as the trans content of the polymer increases from zero to 75%. This can be attributed to a decrease of free volume with decreasing cis content. There is a much more rapid fall in the diffusion coefficient at higher trans contents due to the presence of crystallites and the fall is greater for DDT than for n-hexadecane. At trans contents above 90%, the diffusion coefficient, *D*, in polymer having a volume fraction, *V_a*, of amorphous material, fits the relationship *D_a*=*D_a*(*V_a*)^x with *x* between 0.85 and 1.28 for n-hexadecane and between 1.42 and 1.67 for DDT. The activation energies, *E_D*, for both the diffusants are similar and in the case of the amorphous polybutadienes they are quite close to the activation energies for viscous flow of the polymers. There is only a slow increase of *E_D* with trans content of the polymer until the highly crystalline 100% trans material is reached. A much more marked increase in *E_D* is then obtained indicating a change in the remaining amorphous polymer as a diffusion medium. (15 refs.)

114265 Diffusion of water vapour in polymethyl methacrylate. P.P.Rousis (Chem. Dept., Nuclear Res. Center 'Demokritos', Aghia Paraskevi Attikis, Athens, Greece). *J. Membrane Sci. (Netherlands)*, vol.15, no.2, p.141-55 (Sept. 1983). Certain aspects of the concentration dependence of the diffusion coefficient and on the mechanism of sorption of water vapour in PMMA are investigated. Early time integral sorption kinetics follow the Fickian pattern of initial linearity. Diffusion coefficients deduced from the slopes of these lines are independent of concentration and satisfactorily agree with those obtained from late-time analysis; however, desorption values are higher throughout the whole range of activities than the corresponding absorption ones. On the contrary, typical 'non-Fickian' features are discerned in differential absorption kinetics on membranes of different thickness. These anomalies are attributed to rate-determining relaxation processes concurrent with diffusion, whereas other sorption models are incompatible with the general behaviour of this system. General trends of the equilibrium and kinetic data are compared with those of other polymer-water systems and the observed differences are interpreted in terms of the molecular relaxation model. (27 refs.)

114266 Dye diffusion in anisotropic polyamide fibres. I.D.Rattee, S.S.O (Dept. of Colour Chem., Leeds Univ., Leeds, England). *J. Membrane Sci. (Netherlands)*, vol.15, no.2, p.171-80 (Sept. 1983). Radioactive tracer techniques have been used to study the diffusion of three dyes in polyamide fibres produced under different conditions. Drawn nylon fibres have a surface barrier layer which limits diffusion. The permeability of the layer is reduced by drawing, and varies with drawing conditions. The dependence of dye diffusion on concentration, ionic size and draw ratio is less in the surface than in the bulk of the fibre, but variations in dyeing behaviour have been shown to follow surface rather than bulk diffusion characteristics. (12 refs.)

114267 Diffusion of alcohols and relaxation in poly(methyl methacrylate): effect of thermal history. G.C.Sarti, C.Gostoli, S.Masoni (Inst. di Impianti Chimici, Facoltà di Ingegneria, Univ. di Bologna, Bologna, Italy). *J. Membrane Sci. (Netherlands)*, vol.15, no.2, p.181-92 (Sept. 1983). The sorption behavior of alkyl alcohols in poly(methyl methacrylate) is analyzed after predetermined annealing treatments of the polymer matrix. Weight uptake, penetration depth and sample dimensions are reported versus time. Dimensionless parameters are used, through which master curves are obtained for both weight uptake and the area perpendicular to the main penetration direction. Contrary to what is observed in polystyrene-*n*-alkane systems, in the present case either the specific plasticization of the penetrant must be accounted for, or a non-localized swelling model must be used to explain the behavior. (22 refs.)

114268 Diffusion and solution of methanol vapor in poly(2-vinylpyridine)-block-polyisoprene and poly(2-vinylpyridine)-block-polystyrene. H.Odani, M.Uchikura, Y.Ogino, M.Kurata (Inst. for Chem. Res., Kyoto Univ., Kyoto-fu, Japan). *J. Membrane Sci. (Netherlands)*, vol.15, no.2, p.193-208 (Sept. 1983). Diffusion and solution behavior of methanol vapor in two diblock copolymers, poly(2-vinylpyridine)-block-polyisoprene [P(2VP-b-I)] and poly(2-vinylpyridine)-block-polystyrene [P(2VP-b-S)], was studied by the weighing method at 25°C. The domain structure of films of both copolymers showed an alternating lamellar arrangement. Methanol is a good solvent for P2VP, but a nonsolvent for PI and PS. Methanol dissolved exclusively in the P2VP phase of the copolymers. For both copolymer systems, absorption and desorption processes of non-Fickian type were observed as characterized by a thickness anomaly. However, the magnitude of the deviations from purely Fickian behavior was small, and the integral diffusion coefficient, *D*, was obtainable with reasonable accuracy. At low and medium concentrations, *D* for P(2VP-

b-I) was greater, by about one order of magnitude, than that for P2VP, while *D* for P(2VP-b-S) was lower than that for P2VP. A similar trend was observed in plots of the permeability coefficient against the vapor pressure of methanol. The results indicate that the rubbery PI phase may facilitate the transport of penetrant molecules in the P(2VP-b-I) film. On the other hand, the glassy PS phase in the P(2VP-b-S) film merely interferes with the transport of methanol molecules. (14 refs.)

114269 Determination of hydrogen diffusion in palladium by chemichromic effect. Ya.Ya.Kleperis, S.Ya.Takeris, A.P.Lusis. *Lav. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.122-4 (1983). In Russian.

Hydrogen diffusion in a palladium membrane is determined by optical density measurements of the chemichromic layer—tungsten trioxide. In the pulse method the time dependence of optical density changes repeats the time dependence of potential changes on a clean palladium membrane surface. The coefficients of diffusion and initial concentration of hydrogen in palladium are determined by optical density change measurements. (5 refs.)

114270 Lattice diffusion of substitutional elements in iron and iron-base solid solutions. A critical review. H.Oikawa (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan). *Technol. Rep. Tohoku Univ. (Japan)*, vol.48, no.1, p.7-77 (1983). Lattice diffusion has been reviewed in 33 Fe-X Systems: X=Ag, Al, As, Au, Be, Bi, Ce, Co, Cr, Cu, Ge, Hf, K, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Pd, Pt, S, Sb, Se, Si, Sn, Ti, U, V, W, Zn. Individual datum points of impurity diffusion of most elements in pure iron were plotted on the log*D*/*T* diagrams and representative diffusion parameters, *D₀* and *Q*, were calculated. Tracer diffusion of constituent elements and interdiffusion in Fe-base binary solid solutions were also reviewed. The enhancement parameters, *b* and *B*, were calculated in many systems. (248 refs.)

114271 Tracer diffusion of P in iron and iron alloys. T.Matsuyama (Faculty of Engng., Tohoku Univ., Sendai, Japan), H.Hosokawa, H.Suto. *Trans. Jpn. Inst. Met. (Japan)*, vol.24, no.8, p.589-94 (Aug. 1983). The lattice and grain boundary tracer diffusion coefficients *D_{PL}* and *P_P* of P in BCC iron, Fe-P binary alloys and Fe-0.1 at.% P-M (M: Cr, Si, Mn, Mo and Ni) alloys were measured. There was a break in each of the *D_{PL}*-1/*T* and *P_P*-1/*T* lines at temperatures near and below the Curie temperature, respectively. It is considered that the anomalous breaks were caused by magnetic transformation in the bulk and grain boundary. The effects of Cr, Si and Ni on *D_{PL}* and *P_P* were small. Alloying with Mn increased *D_{PL}* and *P_P*, but alloying with Mo decreased them. (14 refs.)

114272 Iron diffusion in indium phosphide and gallium arsenide. E.J.Foulkes. Univ. Nottingham, England thesis, 1983. Using radiotracer techniques, the diffusion of Fe⁵⁹ in indium phosphide and gallium arsenide was studied for a range of experimental conditions. Iron diffusion in InP was observed for the temperature range 700-900°C. Although problems were encountered with the formation of Fe₂P phases, the tracer profiles were found to consist of two sections, one close to the surface with steep gradient and the other extending throughout the entire thickness of the sample. Such a rapid iron diffusion has not previously been reported and is indicative of an interstitial motion of atoms. The redistribution of iron in diffused substrates was investigated during annealing at 700 and 900°C. Surface pile-ups were observed and were found to be influenced by a phosphorus overpressure. The out diffusion of iron from diffused substrates was investigated during PCl₃ vapour epitaxy. Substantial amounts of out diffused Fe were measured in the epilayer. Iron diffusion into GaAs was studied for the temperature range 700-1000°C. At 1000°C the diffusion profile shapes were similar to those observed for diffusion into InP. For lower temperatures a rapid cut-off in the GaAs bulk indicated a much smaller effective diffusivity. The EPR technique was successfully applied to substrates diffused with iron at 1000°C enabling quantitative measurements of the density of FeGa₃⁺ centres to be undertaken.

114273 Vibrational state and jump frequency of Mossbauer impurity associated with a vacancy in metals. M.Hashimoto, Y.Ishida (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan), R.Yamamoto, M.Doyama. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.437-40. Vibrational local densities of states for the equilibrium configuration and the saddle-point configuration of a vacancy.¹⁹⁷Au complex in copper were calculated by the recursion method using the Morse potential. The jump frequencies of the impurity diffusion were estimated. A correlation was found between the pre-exponential factor of the jump frequency and the activation energy for migration. (9 refs.)

114274 Measurement of radiation induced impurity diffusion in copper. V.Naundorf, M.-P.Macht, H.-J.Gudlart, H.Wollenberger (Hahn-Meitner-Inst., KFA, Berlin GmbH, Berlin, Germany). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.934-7. Partial diffusion coefficients of nickel and beryllium in copper have been measured after irradiation with 300 keV Cu⁺ ions between 300 and 600K. For both solutes the diffusion coefficients exhibit a rather small temperature dependence. At room temperature and for a defect production rate of 8×10⁻⁴ sec⁻¹ the partial diffusion coefficients of Ni and Be in Cu are 9×10⁻¹⁷ cm²/sec and 8×10⁻⁶ cm²/sec, respectively under stationary conditions. The results are discussed within the framework of well-known defect reaction schemes. In particular, the possibility of slowing down of long range transport by solute trapping at internal defect sinks is considered. (22 refs.)

114275 Modeling of dopant diffusion and associated effects in silicon. R.B.Fair (Microelectronics Center of North Carolina, Research Triangle Park, NC, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.61-74. Research in the area of dopant diffusion in Si has focused on identifying the specific mechanisms and point defects involved. Recent approaches include observing the effects of diffusion and doping on oxygen precipitation, stacking fault growth or shrinkage, enhanced/retarded diffusion of one dopant in the presence of another. Very few of these studies have yielded unambiguous interpretations as a result of the indirect nature of the experiments. However, taken together one can infer the relative importance of vacancies versus Si self-interstitials in the diffusion of each dopant species. (45 refs.)

114276 Formation of interstitial defects in high concentration shallow phosphorus diffusions in Si. R.Jaccodine (Sherman Fairchild Lab., Lehigh Univ., Bethlehem, PA, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.101-6.
An experimental study of high concentration (10^{19} - $10^{21}/\text{cm}^3$) shallow diffusion was undertaken using TEM to investigate the nature of these diffusion-related defects. Phosphorus from a wide variety of sources (PBr_3 , POCl_3 , etc.) other than ion implantation was used in temperature range from 950° - 1100°C and for times of 15 minutes to 1 hour. Care was taken in surface preparation and material selection to avoid extraneous defects from sources other than diffusions. A high concentration of small dislocation loops ($10^{12}/\text{cm}^2$) was present in the top few microns of the wafers. Diffraction contrast on the loops revealed that they are of edge character with Burger's vector $\mathbf{b} = \frac{1}{2}(110)$. Identification of the nature of these loops by tilting method [(g.b).s] and anomalous dark-faced black-white lobes show they are of the interstitial type, i.e. the observed defects place the surrounding matrix in a compressive state. (14 refs.)

114277 Observation of oxidation-enhanced and -retarded diffusion of antimony in silicon: the behavior of (111) wafers. T.Y.Tan, B.J.Ginsberg (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.141-5.
An experiment was performed to study the oxidation-enhanced and -retarded diffusion (OED and ORD) of Sb in silicon wafers oxidized in dry O_2 at 1160°C . The ORD data of (100) wafers agree well with the prediction of a model assuming that Si self-interstitials (I) and vacancies (V) coexist in thermal equilibrium at high temperatures. An adjustment of the I supersaturation values is needed to bring the ORD/OED data of (111) wafers to fit with the model satisfactorily. This indicates the existence of a mechanism which injects V into (111) wafers in addition to the normal mechanism of I injection due to SiO_2 growth. (18 refs.)

114278 Effect of oxygen on radiation-enhanced diffusion in silicon. V.E.Borisenko (Minsk Radioengng. Inst., Minsk, Belorussian SSR).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.159-64.
Low-energy ion bombardment has been used to enhance diffusion of phosphorus and antimony atoms in silicon. Oxygen free silicon crystals both containing phosphorus and antimony doped surface layers and original crystals were bombarded at 400 - 700°C with 400 eV oxygen or argon ions. Impurity and electrical carrier profiles were measured to analyse the role of oxygen in the radiation-enhanced diffusion. The results obtained are explained by assuming complexes such as vacancy-oxygen and vacancy substitutional impurity to be involved in the process. (16 refs.)

114279 Enhanced diffusion of phosphorus at grain boundaries in silicon. L.J.Cheng, C.M.Shyu, K.M.Stika (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.383-7.
It is found that the grain boundaries in cast polycrystalline silicon material capable of enhancing diffusion always have strong recombination activities. Both phenomena could be related to the existence of dangling bonds at boundaries. Because the enhanced diffusion is an atomic transport phenomenon and the recombination is an electronic process, the relationship between the two phenomena is still not clear at this moment. The present study gives the first evidence that incoherent second order twins of $\{111/115\}$ type are phosphorus diffusion-active. (6 refs.)

66.30L Diffusion, migration, and displacement of other defects

114280 Interfacial stability of migrating brine inclusions in alkali halide single crystals supporting a temperature gradient. S.K.Yagnik (Dept. of Nuclear Engng., Iowa State Univ., IA, USA).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.612-26 (Aug. 1983).
Application of a temperature gradient to a solid containing inclusions exerts a driving force which sets the inclusions in motion towards higher temperatures. Since the inclusions are essentially negative crystals, they retain definite shape with the inclusion walls being low index crystallographic planes of the host solid matrix. The migration speed of these inclusions is known to depend on the kinetics of interfacial crystallization/dissolution, which favors layer-by-layer growth/dissolution. Despite these effects, which tend to keep the inclusion walls stable and straight, interfacial instabilities are occasionally observed in the migrating inclusions. A perturbation method is used to analyze such instabilities at a planar interface growing from solution. The model is applied to the interfaces of the temperature gradient driven brine inclusions in alkali halide single crystals, and the resulting stability criteria are checked against limited available experimental data. (16 refs.)

114281 Migration of interstitial dumbbell in concentrated solid solutions. J.-L.Bocquet (CENS, Gif-sur-Yvette, France).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.664-6.
It is shown that a mean-field formulation provides a convenient frame to evaluate the diffusivity of interstitial dumbbell-like defects. Monte Carlo simulation runs yield results in good agreement with the mean field approximation. (5 refs.)

114282 Radiation enhanced diffusion in FCC alloys. W.Schule (Joint Res. Centre, Ispra, Italy).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.667-9.
In many alloys vacancies and interstitials can be identified in a straightforward way by measurements of radiation enhanced diffusion. In some alloys, however, quenching experiments are also necessary for the identification of these defects. Results for two characteristic alloys in which the transformation rate during high energy particle irradiation is determined by an interstitially and by a vacancy diffusion mechanism only are discussed. It is also shown that a decrease of the migration energy of defects due to an interaction of the high energy particles with the lattice atoms must be taken into account in the interpretation of the results. (16 refs.)

114283 A diffusion-reaction model for solid solutions under irradiation. R.Cauvin, G.Martin (Section de Recherches de Metall. Phys., CENS, Gif-sur-Yvette, France).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.931-3.
The diffusion matrix for the four component system (solvent, solute, vacancy, interstitial) is derived as a function of the various defects jump frequencies. The state of the solid solution under irradiation is shown to be described by a system of three coupled balance equations for the total concentrations of vacancies, interstitials and solute atoms. The relevance of this model to the theory of homogeneous and heterogeneous irradiation induced precipitation, as well as to other high temperature irradiation effects is discussed. (15 refs.)

114284 Dynamic observation of atomic-level events in cadmium telluride by high resolution TEM. T.Yamashita, R.Sinclair (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.295-9.
A conventional 120 keV high resolution TEM equipped with a TV camera has been used to make lattice resolution video recordings of cadmium telluride in the $\langle 110 \rangle$ orientation. The motion of dislocations and the migration of atomic species at the edge of the crystal have been studied. These processes are thought to be induced in the crystal by localized heating of the specimen by the electron beam. The observations are made on a TV monitor at a total magnification of 15 million times. (8 refs.)

114285 Comparisons of the nuclear reactions $^{18}\text{O}(p, \alpha)^{15}\text{N}$ and $^{16}\text{O}(d, \alpha)^{14}\text{N}$ to study the oxygen effects in Pt silicide formation. C.-D.Lien, L.Wielunski, M.-A.Nicolet (California Inst. of Technol., Pasadena, CA, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.463-7 (1 Aug. 1983).
2 MeV backscattering spectrometry (BS) and nuclear reactions (NRs) $^{18}\text{O}(p, \alpha)^{15}\text{N}$ induced by 1.5 MeV H_2^+ and $^{16}\text{O}(d, \alpha)^{14}\text{N}$ induced by 900 keV D^+ have been used to study the effect of implanted oxygen on Pt silicide formation. The location of oxygen before and after silicide formation was deduced from NR spectra. Advantages and disadvantages of these two NRs in this application are discussed. (21 refs.)

114286 Internal friction study on diffusivity on the Cu-SiO₂ interface. N.Shigenaka, M.Koda, T.Mori (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan).

Scr. Metall. (USA), vol.17, no.8, p.1021-2 (Aug. 1983).
Describes two indirect but convenient methods, both of which utilise internal friction measurements, for studying matrix-particle interface diffusion. The authors supplement the work of Mori et al. (see Acta Metall. vol.31, p.275, 1983) on Cu-SiO₂ by repeating the experiment using method 2. (10 refs.)

114287 Radiation induced interdiffusion and phase transformation in electron irradiated Cu-Ni alloys. R.Poerschke, W.Wagner, H.Wollenberger (Hahn-Meitner-Inst., KFA Berlin GmbH, Berlin, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.938-41.

The Cu-Ni alloys in the composition range around 50:50 have shown considerable interdiffusion by an interstitial mechanism. The present paper collects all available experimental data which yield quantitative information on this diffusion mechanism. Also treated is the question of irradiation induced phase transformation as origin of the observed periodic decomposition structure in these alloys. (24 refs.)

66.30Q Electromigration

114288 Observation of rapid field aided diffusion of silver in metal-oxide-semiconductor structures. J.D.McBrayer, R.M.Swanson, T.W.Sigmon (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA), J.Bravman. *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.653-4 (1 Oct. 1983). Fast electric field aided diffusion of silver in SiO₂ has been observed for fields of 10⁴ V/cm and temperatures as low as 275°C. The diffusion coefficient of silver in SiO₂ is estimated to be 10⁻¹³ cm²/s at 300°C, with an activation energy of 1.24 eV. The consequences of Ag contamination in very large scale integrated metallization systems are discussed. (4 refs.)

114289 Contribution to the theory of grain-boundary electromigration. M.Kedro. *Elektrotech. Cas. (Czechoslovakia)*, vol.34, no.5, p.313-17 (1983). In Slovak. The system of electromigration equations for a model of two grains with an interface is solved considering nonsteady electron-wind force. Results involve time dependence of the migrating atoms concentration. (7 refs.)

114290 Electromigration of fast diffusers in lead, lead solders, and tin. H.B.Huntington (Dept. of Phys., Rensselaer Polytech. Inst., Troy, NY, USA). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.589-95. Electromigration by the steady state technique has been applied to several fast diffusers in lead. The resulting Z*’s are mostly small and may be of either sign, although Z_{Ni}* turned out to be -6 at dilute concentration. When tin is added to lead up to the solubility limit Z_{Ag}* decreases in magnitude and changes sign, although the diffusivity is only moderately increased. Nickel, gold and copper show rapidly decreasing diffusivity since they apparently bind to the tin atoms. No marked changes in Z* for these impurities have yet been noted. Down the c-axis of single crystal tin the authors find Z_{Ag}* of -4.5 and Z_{Au}* of -1.2. (16 refs.)

66.60 THERMAL CONDUCTION IN NONMETALLIC LIQUIDS
(for thermal conduction in liquid metals, see 72.15C)

114291 Thermal conductivity measurements on fluids under microgravity using holographic interferometry. K.Wanders (DFVLR, Advanced Programme Div., Koln, Germany), G.P.Gorler, H.Steinbichler. Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.403-8. Measurement of the thermal conductivity of a fluid medium under normal gravitational conditions basically is affected by the additional heat transfer caused by thermal convection in the medium. The condition prevailing on board of SPACELAB now offers the possibility of carrying out precise measurements under reduced gravity and under essential elimination of convection. The objective of the proposed measurements is to investigate and measure the various phenomena occurring in connection with heat transfer in in the vicinity of a filament extended in a fluid. Measurement is performed by means of holographic interferometry which allows high-resolution observation of temperature distribution and heat transfer processes in transparent media as a function of location and time. The advantage of this laser measuring method is its special feature of three-dimensional resolution and the rather simple equipment requirements. (14 refs.)

66.70 NONELECTRONIC THERMAL CONDUCTION AND HEAT-PULSE PROPAGATION IN NONMETALLIC SOLIDS
(for thermal conduction in solid metals, see 72.15C and 72.15E; for statistical mechanics of lattice vibrations, see 63.70)

114292 Photoacoustic determination of thermal diffusivity of solids: Application to CdS. C.L.Cesar, H.Vargas, J.Mendes Filho (Inst. de Fisica, Univ. Estadual de Campinas, Campinas, Sao Paulo, Brazil), L.C.M.Miranda. *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.555-7 (15 Sept. 1983). A novel and simple approach, which uses a lateral heating source for the sample, is proposed as an alternative method for the photoacoustic determination of the thermal diffusivity of solids. The method is experimentally tested using a CdS sample. (9 refs.)

114293 Band-state interpretation of lattice thermal conductivity and microhardness of ternary chalcopyrite semiconductors. L.K.Samanta, D.K.Ghosh, G.C.Bhar (Dept. of Phys., Burdwan Univ., Burdwan, India). *Chem. Phys. (Netherlands)*, vol.79, no.3, p.361-5 (15 Sept. 1983). A new approach utilising the concept of band states and periodicity has been used to explain the lattice thermal conductivity and microhardness of ternary chalcopyrite crystals. The experimental values agree quite well with the calculated values using the authors’ model. A single fitting parameter used in each case explains the uniqueness of the model. (19 refs.)

114294 Low-energy excitations in (KBr)_{1-x}(KCN)_x in the orientational glass state. J.J.De Yoreo, M.Meissner, R.O.Pohl (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA), J.M.Rowe, J.J.Rush, S.S.Susman. *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1050-3 (19 Sept. 1983). The thermal conductivity of single-crystal (KBr)_{1-x}(KCN)_x, 0.05 ≤ x ≤ 0.5, in the temperature range 0.08-100K shows behavior characteristic of amorphous solids. The low-temperature specific heats (T < 2.5K), measured on long (~50 s) and on short (<0.2 ms) time scales, also are identical to those found in amorphous solids. It is proposed that the KBr-KCN system provides a connecting link between the low-energy excitations in amorphous solids and in spin-glasses. (17 refs.)

114295 Thermodynamic and kinetic properties of amorphous dielectrics at low temperatures. L.I.Trakhtenberg, V.N.Flerov (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1103-11 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1908-23 (Nov. 1982). [received: Sept. 1983]. It is shown that it is important to take account of the influence of vibrations of the medium on the tunneling of heavy particles in a two-level system when studying relaxation processes in glasses. Zero-point vibrations increase the

probability of tunneling by several orders of magnitude. As the temperature is raised, single-phonon processes first give a contribution and then multiphonon processes. The periodic reduction in the potential barrier by vibrations of the medium play an appreciable role. With this mechanism the double-peaked temperature dependence of the inverse ultrasonic attenuation length can be explained and also the temperature dependence of the thermal conductivity and of the luminescence intensity (the so-called ‘inverse Arrhenius law’). (32 refs.)

114296 Thermal conductivity of irradiated graphite. T.Nihura (Faculty of Engng., Ibaraki Univ., Ibaraki, Japan), T.Iwata. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.236-8. Phonon scattering by lattice defects in graphite has been studied by measuring the a-axis thermal conductivity of electron-irradiated and neutron-irradiated pyrolytic graphite crystals. Phonon scattering by interstitial atoms, interstitial clusters, vacancies and grain boundaries, and a resonance-like scattering are distinguished. (3 refs.)

67.40 BOSON DEGENERACY AND SUPERFLUIDITY OF HELIUM-4

114297 Bifurcation and the universal sequence for first-sound subharmonic generation in superfluid helium-4. C.W.Smith, M.J.Teiwani (Dept. of Phys. & Astron., Univ. of Maine, Orono, ME, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.85-8 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982). Measurements show that below the superfluid transition, the generation of first-sound subharmonics in the low-megahertz range quantitatively follows the Feigenbaum universal convergence for period doubling and qualitatively includes frequencies which correspond to the universal sequence. In addition, by using ion-trapping techniques the physical nature of the onset of the first bifurcation is identified as the threshold for the generation of quantum vortex line, not the threshold for the production of macroscopic classical turbulence, i.e. acoustic cavitation. (12 refs.)

114299 Phase space analysis of convection in a ³He-superfluid ⁴He solution. H.Haucke, Y.Maeno (Los Alamos Nat. Lab., Los Alamos, NM, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.69-72 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982). Observations have been made on thermal convection below 1K in a dilute solution of ³He in superfluid ⁴He contained in a cylindrical cell of aspect ratio Γ=1.20. Complicated oscillatory phenomena were observed with a high degree of reproducibility using two temperature sensors. Phase space analysis suggests a description in terms of strange attractor dynamics. (6 refs.)

67.80 SOLID HELIUM AND RELATED QUANTUM CRYSTALS

114300 Vacancies in the core of a dislocation in solid helium. H.Suzuki (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.766-9. Diffusion of vacancies in the core of a dislocation in solid helium is discussed. The vacancies have a negative formation energy and behave as free particles in a one dimensional space. The vacancies are scattered by vibrations of the dislocation and the diffusion constant of vacancies is given by D=hv_s²/4kT, where v_s is the shear wave velocity of solid helium. Nodes of a dislocation network in solid helium are not pinning points in low-frequency measurements of mechanical properties. It is concluded that climb of dislocation networks is the most important cause of internal friction at low frequencies. (8 refs.)

114301 Theory of the Leidenfrost phenomenon. Yu.A.Buevich, V.N.Man-kevich (Ural State Univ., Sverdlovsk, USSR).

High Temp. (USA), vol.20, no.6, p.902-9 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1136-44 (Nov.-Dec. 1982). [received: Sept. 1983]

The spheroidal state of a drop evaporating on a heated horizontal surface is examined, allowing for the dependence of the equilibrium temperature at the evaporation surface (the lower surface of the drop) on the excess pressure below it, the effects of molecular slip at the boundaries of the vapor layer, and of molecular forces of surface interaction. For drops heated to saturation temperature this state is possible in the case where the surface temperature exceeds some critical value, the Leidenfrost temperature. The authors evaluate a critical surface temperature above which an underheated drop does not come in direct contact with the surface, i.e. the spheroidal state is set up. (14 refs.)

114302 Effects of adsorbed films on gas bubble radial oscillations. R.E.Glazman (Dept. of Ocean Engng., Univ. of Rhode Island, Kingston, RI, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.980-6 (Sept. 1983).

Adsorption films' mechanical properties are discussed. With regard to a problem of bubble oscillations in a surfactant solution, dynamical boundary conditions at the bubble wall are modified by including a new term to account for a normal force component caused by dilational elasticity of an adsorbed film. Consequently, the Rayleigh-Plesset equation acquires a term which affects the restoring force of bubble oscillations. A linearized theory (for small-magnitude oscillations) is developed which shows that the film dilational elasticity induces a change in the mean radius and a shift in the natural frequency of bubble oscillations. These effects become extremely important when a capillary component $2\sigma/R_0$ accounts for at least 20% of the total pressure inside the bubble. (33 refs.)

114303 Computer-controlled apparatus for interfacial tension measurements. M.Carla, G.Aloisi, G.Papeschi, S.Bordi (Istituto di Chimica Fisica, Univ. di Firenze, Firenze, Italy).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1859-62 (Sept. 1983).

A fully computer-controlled apparatus for interfacial tension measurements at the mercury/solution interface is described. The apparatus is based on the drop time method, whose reproducibility and accuracy have been improved by a new calibration technique and the use of a glass polyethylene dropping electrode. (15 refs.)

114304 Surface tension variation in multiphase fluid systems. D.J.Klinger, M.E.Fisher, B.Widom (Baker Lab., Cornell Univ., Ithaca, NY, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2841-5 (21 July 1983).

The isothermal variation of surface tension with composition is computed through contiguous two- and three-phase regions within the van der Waals theory of interfaces using the Griffiths thermodynamic model of multicomponent fluids. The surface tension is continuous on crossing from the two- to three-phase region but, in general, its derivative with respect to composition is discontinuous. Recent surface tension measurements on oil-brine-surfactant systems agree qualitatively with the theory but are inadequate to check the finer points. (13 refs.)

114305 Stability of the plane wave front of fluid evaporation. E.B.Levchenko, A.L.Chernyakov.

J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.870-6 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.144-50 (Nov.-Dec. 1982). [received: Sept. 1983]

An evaporation wave is propagated in the bulk of a substance subjected to a powerful radiation flux in a condensed medium. The stability of the plane fluid evaporation wave front considered as the surface of discontinuity of the thermodynamic functions of the substance is investigated. An instability mechanism turns out to be decisive for the development of fluctuations of a front with wavelengths commensurate to the diameter of the radiation focusing spot. A substantial feature of the evaporation process is the high velocity of vapor escape, which is commensurate with the speed of sound in a gas. Taking account of the vapor compressibility results in a change in both the conditions of origination and the nature of the development of the instability of the plane fluid evaporation wavefront. (7 refs.)

114306 Spreading of Ni-Fe-W melts on polycrystalline tungsten. V.L.Yupko, R.V.Minakova, O.P.Kolchin, L.S.Vodopyanova, N.I.Monastayeva, V.L.Voitenko (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.44-7 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.49-53 (Jan. 1983). [received: Aug. 1983]

A study was made of the wetting of polycrystalline tungsten by Ni-Fe-W alloys with a nickel-to-iron ratio of 7:3 and tungsten contents ranging from 0 to 40%. Similar experiments were conducted on porous tungsten. In addition, an investigation was carried out into the wetting of polycrystalline tungsten by alloys of constant tungsten content (24%) and different nickel-to-iron ratios (3:7, 5:5, 7:3, and 8:2). Experiments were carried out in a vacuum corresponding to $(5-10) \cdot 10^{-3}$ Pa at a temperature of 1763 ± 10 K. (9 refs.)

68.20 SOLID SURFACE STRUCTURE

114307 Surface structure change of a crystal in solution. V.V.Podolinsky, V.G.Drykin (Dept. of Phys., Inst. of Construction Engng., Dnepropetrovsk, USSR).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.532-8 (Aug. 1983).

A given substance can crystallize from various solvents with different morphology. In the case of organic systems the solvent has a larger influence on the solid-liquid interface than the temperature. The degree of molecule roughness of the solid-liquid interface can be increased or decreased by selection of the solvent. As a result faceted to nonfaceted or nonfaceted to faceted transitions can occur by increasing the concentration of the solvent. (28 refs.)

114308 Material surface modified by ion implantation and ion beam mixing. M.Iwaki (Inst. of Phys. & Chem. Res., Saitama, Japan).

J. Vac. Soc. Jpn. (Japan), vol.26, no.2, p.189-95 (1983). In Japanese.

The ion injection technique that modifies properties of the surface layer of a solid material by injection of an accelerated ion into the layer is indispensable as an impurity doping method in semiconductor element fabrication. The author describes: (1) the distribution of injected ions, (2) mechanical properties of ion-injected iron, (3) chemical and electrical properties of ion-injected iron, and (4) surface quality improvement by ion beam mixing. (26 refs.) K.B.

114309 Quantitative analysis of LEED measurements. D.L.Adams, H.B.Nielsen, J.N.Andersen (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).

Phys. Scr. (Sweden), vol.T4, p.22-8 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

Experimental LEED intensity-energy spectra measured for the Al(111), Al(110), V(110), V(100), and Cu(110) surfaces are analyzed by means of r -factor comparisons with calculated spectra. The surfaces of Al(111) and V(110) are shown to correspond to nearly perfect terminations of the corresponding bulk structures. These systems are used to investigate the influence of the nonstructural variables of the calculations on the structure determination. The r -factor procedures are then applied to the determination of the surface structures of Al(110), V(100), and Cu(110). For these systems, it is found that the surface interlayer spacings exhibit a damped, oscillatory deviation from the bulk value, in qualitative agreement with the recent predictions of Landman et al. (1980). (31 refs.)

114310 Clean and adsorbate-induced surface phase transitions on W{100}. D.A.King (Donnan Labs., Univ. of Liverpool, Liverpool, England).

Phys. Scr. (Sweden), vol.T4, p.34-43 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The clean surface of W{100} undergoes a reversible phase transition from (1×1) to $(\sqrt{2} \times \sqrt{2})R45^\circ$ on cooling below room temperature, attributable to inherent instabilities of top layer W atoms. These instabilities are also revealed in studies of adsorbate-induced structures and phase transitions on this surface. A review is presented of the now numerous experimental studies of these phase transitions on W{100}, particularly LEED and angle-resolved photoelectron spectroscopy but also including high and low energy ion scattering, field ion microscopy, thermal desorption, vibrational spectroscopy, electron stimulated desorption, surface core level spectroscopy, and spin-polarized LEED, with a view to consolidating the present status of both the surface crystallography and the surface electronic structures of the various phases. The substantial input from theoretical groups concerning the driving force for the phase transitions is briefly reviewed in the light of experimental results. (73 refs.)

114311 Analysis of magnetic and nonmagnetic surfaces by spin-polarized low-energy electron diffraction. R.Feder (Theoretische Festkörperphys., Univ. Duisburg, Duisburg, Germany).

Phys. Scr. (Sweden), vol.T4, p.47-51 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

A survey is given of most recent progress in harnessing electron spin polarization for the study of crystalline surfaces by low-energy electron diffraction (LEED). Spin-polarized LEED from nonmagnetic surfaces has been extended both experimentally and theoretically to low-Z surfaces, for which spin-orbit coupling is weak, to adsorbate systems, and to very low energies, where fine structure effects associated with the surface potential barrier are prominent. For ferromagnetic transition metal surfaces, measurement of the exchange-induced scattering asymmetry has revealed the surface Curie temperature and the critical exponent of the surface magnetization. At lower temperature, comparison with corresponding calculated exchange asymmetry profiles has successfully been employed for the determination of the layer dependence of the magnetization in the surface region. (35 refs.)

114312 (111) facets as the origin of reconstructed Au(110) surfaces.

G.Binnig, H.Rohrer, Ch.Gerber, E.Weibel (IBM Zurich Res. Lab., Ruschlikon, Switzerland).

Surf. Sci. (Netherlands), vol.131, no.1, p.L379-84 (Aug. 1983).

The Au(110) surface has been investigated by scanning tunneling microscopy. The reconstructed surface consists of long ribbons of narrow (111) facets along the [110] direction with maximum three free rows. Two-row facets give rise to the 1×2 reconstruction of the missing-row type while three-row facets account for the 1×3 reconstruction. Disorder arises from locally random sequences of the two facets. (18 refs.)

114313 Surface structure of the Si (111)- 5×1 -Au studied by low-energy ion scattering spectroscopy. Y.Yabuuchi, F.Shoji, K.Oura, T.Hanawa (Electron Beam Lab., Osaka Univ., Osaka, Japan).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.L412-18 (Sept. 1983).

The Au/Si (111) system has been studied by low-energy ion scattering spectroscopy combined with LEED-AES. It has been found that the Au atoms causing the 5×1 structure are slightly embedded below the outermost Si layer. A new model of the 5×1 -Au structure is presented. (10 refs.)

114314 Helium diffraction from Ni (100). A study of the clean surface and of hydrogen and carbon adsorption phases. K.H.Rieder, H.Wilsch (IBM Zurich Res. Lab., Ruschlikon, Switzerland).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.245-57 (Sept. 1983).

He scattering from the clean Ni (100) surface gives extremely weak diffraction beams, corresponding to a very small corrugation amplitude of ≈ 0.01 Å. Hydrogen adsorption at temperatures between 100 and 200K leads to the formation of an ordered (1×1) phase with a corrugation amplitude only three times larger than that of the clean surface. Surface charge-density calculations using overlapping atomic charge densities indicate a normal distance of the hydrogens from the topmost Ni layer $d_h \approx 0.9-1.0$ Å. He diffraction from the $c(2 \times 2)$ structure of carbon on Ni (100) confirms the $p4g$ symmetry of this phase, and the best-fit corrugation function reflects the different local distortions of the substrate atoms around the corner and centre carbon atoms. Charge-density calculations yield for the carbon atoms in fourfold hollows $d_h \approx 0.1-0.2$ Å, in good agreement with earlier LEED results. (30 refs.)

114315 Non-equilibrium surface segregation of silicon in Fe-6.3 at.% Si (110). J.du Plessis, P.E.Viljoen (Dept. of Phys., Univ. of the Orange Free State, Bloemfontein, S Africa). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.321-7 (Sept. 1983).

The non-equilibrium segregation of silicon from the bulk to the (110) surface of a Fe-6.3 at.% Si single crystal was monitored in the temperature range 484 to 536°C by means of AES. Two distinct processes were observed. Initially a diffusion process controlling the initial surface enrichment of Si up to a temporary equilibrium value of about 15% was observed. This value corresponds to a 7×1 LEED pattern observed in similar crystals. Subsequently a two-dimensional nucleation process starts allowing more atoms onto the surface. Activation energies for both mechanisms were determined and are respectively 170±20 and 480±60 kJ/mol. (19 refs.)

114316 Observation of surface atomic structure in real space scanning tunneling microscopy—Si (111) 7×7 super-structure. H.Iwasaki, S.Nakamura. *Solid State Phys. (Japan)*, vol.18, no.6, p.351-6 (June 1983). In Japanese. A novel type of microscope developed by G. Binnig et al. (1982, 1983) is introduced with its successful application to the Si 7×7 structure. Its atomic resolution is discussed by analogy to the field ion microscope. (13 refs.)

114317 Analysis of surfaces and thin films. M.Hayes (Hirst Res. Centre, GEC plc, Wembley, England). *Surf. Technol. (Switzerland)*, vol.20, no.1, p.3-27 (Sept. 1983).

The aim of this review is to provide a guide for the occasional user or would-be user to the readily available and best-documented techniques that have been used or may be used to supplement the data from other experimental methods. The following types of technique are described: techniques utilizing an incident beam of electrons; techniques utilizing an incident beam of ions; techniques utilizing an incident beam of photons. Acoustic microscopy and spark source mass spectrometry are also mentioned. (353 refs.)

114318 Surface relief of crystalline quartz etched in a planar plasma reactor. B.G.Pantchev, M.G.Mikhailov, P.Danesh (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria). *Thin Solid Films (Switzerland)*, vol.106, no.3, p.137-44 (19 Aug. 1983).

The surface morphology of dry etched crystalline quartz was studied by transmission electron microscopy (replica technique). The experiments were carried out by reactive ion etching (RIE), plasma etching and argon sputter etching. Argon sputter etching does not alter the sample surface. RIE and plasma etching lead to surface roughness when an aluminium electrode is used. The cone-like asperities produced, typical of the beginning of etching, develop into island-like relief during a longer experiment. It is concluded that the surface roughness is caused by the combined action of backscattering of aluminium particles and their protecting effect in a CF₄ plasma. (11 refs.)

114319 ESCA studies of the incorporation of oxygen into nickel surfaces.

H.Matsueda, B.L.Averbach (MIT, Cambridge, MA, USA). *Trans. Jpn. Inst. Met. (Japan)*, vol.24, no.8, p.574-80 (Aug. 1983).

ESCA data have been obtained on the incorporation of oxygen into nickel surfaces at room temperature. The surfaces were cleaned by argon ion bombardment, and the Ni 2p 3/2 line was observed as a function of the exposure to oxygen. The development of NiO-like components indicated that oxygen was being incorporated into the surface lattice. At low oxygen exposures a linear kinetic law was observed, with $W=1.65 \times 10^{-3} L+0.226$, where W is the thickness of the incorporated layer in nm and the exposure, L , is $tp^{1/2}$, t being the exposure time in seconds and p the oxygen pressure in Pa. At high exposures, which were defined approximately as $L>250$, the thickness followed the logarithmic tarnishing law, with $W=1.44 \times 10^{-2}$ in $L+0.533$. The authors have postulated that the initial stage involves the incorporation of oxygen into the surface lattice via a cooperative displacement of the surface nickel atoms by a process of thermal activation assisted by a surface electric field induced by a charge transfer from a chemisorbed layer. The second stage appears to require the diffusion of oxygen into the bulk by means of thermal activation assisted by a strong electric field across the oxidized layer maintained by electron tunneling from the valence band of the bulk nickel. (24 refs.)

114320 Reflection electron microscopy (REM) of FCC metals. T.Hsu, J.M.Cowley (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA).

Ultramicroscopy (Netherlands), vol.11, no.4, p.239-50 (1983). Reflection electron microscopy (REM) using diffracted beams from bulk specimens is shown to be possible with commercial electron microscopes. Surface images have been recorded from single crystal Au and Pt (111) surfaces. These images reveal growth steps, dislocations, slip traces, and other features. Geometrical restoration has been made of foreshortened images, and analysis of image contrast shows the importance of out-of-focus phase contrast and the diffraction contrast from strain fields. (13 refs.)

114321 Surface properties of laser-annealed semiconductors. D.M.Zehner, C.W.White (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.281-324. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

The authors show that pulsed laser irradiation can be used to produce atomically clean surfaces, metastable surface structures, and surfaces with electronic properties that cannot be achieved by conventional methods. Details concerned with processing of the surface in order to achieve these conditions and the measurement of surface properties are discussed. They show that levels of unwanted impurities on semiconductors (O, C, etc.) can be reduced to near the practical detection limits [using Auger electron spectroscopy (AES)]. This is accompanied by the observation of well-defined low-energy electron diffraction (LEED) patterns and evidence of ordered surface structures is discussed. The authors also show that, for (111)-oriented crystals of Si and Ge, laser irradiation leads to a metastable (1×1) surface structure and that a dynamical LEED analysis of the Si surface suggests that the first and second outermost interlayer spacings exhibit substantial relaxation (in the absence of ordered lateral reconstruction). However, the proposed surface structure is not in agreement with results of photoemission experiments when interpreted using one-electron-band structure calculations. Possible reasons for this discrepancy are cited. Finally, they show that the combination of ion implantation and laser annealing can be used to produce surfaces with electronic properties that cannot be achieved by conventional methods. (49 refs.)

114322 Structural studies of metal-semiconductor interfaces with high-resolution electron microscopy. J.M.Gibson, R.T.Tung, J.M.Poate (Bell Labs., Murray Hill, NJ, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.395-409

The authors have studied interface atomic structure in epitaxial cobalt and nickel disilicides on silicon using high-resolution transmission electron microscopy. By employing UHV techniques during deposition and reaction they have grown truly single-crystalline NiSi₂ and CoSi₂ films on (111) Si and in the former case on (100) Si. These films are shown to be continuous to below 10 Å thickness. By close control over preparation conditions, afforded by UHV, they can greatly influence the nucleation and growth of these films to

the extent, for example with NiSi₂ on (111) Si, of yielding continuous single-crystal films with either of two orientations as desired. Whilst in the (111) NiSi₂ on Si system the interfacial structure invariably appears to well-fit a model in which metal atoms nearest to the interface are 7-fold co-ordinated, for (111) CoSi₂ on Si agreement is generally better with a model involving 5-fold co-ordination of these atoms. A misfit dislocation core is also imaged. Results are discussed in the light of silicide nucleation and growth. The structure and stability of the (100) NiSi₂ on Si interface is also considered. (19 refs.)

114323 Investigations of metal-silicon interfaces by time-of-flight atom probe. C.Grovenor, G.Smith (Dept. of Metall. & Sci. of Materials, Oxford, England).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.429-33

The use of a Time-of-Flight Atom Probe in the analysis of silicon surfaces, and the interfaces between metals and silicon, promises to provide very accurate chemical analysis allied with structural information from Field Ion Microscopy images. This paper presents results on the analysis of silicon surfaces by this technique, showing that good spectra can be obtained without difficulty. Some preliminary experiments on the structure of such specimens after the deposition of thin layers of Pd and Ni will be described, concentrating on the analysis of the stoichiometry of the reacted layers. 68.25 MECHANICAL AND ACOUSTICAL PROPERTIES OF SOLID SURFACES AND INTERFACES

(for tribology, see 62.20P and 81.40P)

114324 Transmission and reflection of a surface wave at a corner of two planes on an isotropic body. W.Pajewski, M.Szalewski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).

Arch. Acoust. (Poland), vol.8, no.1, p.3-10 (1983).

Reports an experimental investigation of the diffraction of a Rayleigh wave at a corner of an isotropic solid bounded by two planes forming a dihedral angle with respect to each other. Application of piezoelectric transducers and their appropriate setting on samples permitted the determination of the coefficient of reflection and transmission of Rayleigh waves at a corner and the directional characteristics of transverse waves, with polarisation in a plane perpendicular to the surface of R propagation, radiated at that time by the corner. The results were compared with the results of papers published in the world literature. (5 refs.)

114325 Surface friction constant and range of dynamical interaction between adatoms on metal surfaces. J.S.McCaskill, N.H.March (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England). *Surf. Sci. (Netherlands)*, vol.131, no.1, p.34-48 (Aug. 1983).

The electronic contribution to the surface friction constant of an adatom on a metal surface is calculated using: (i) the Dirac density matrix for an infinite barrier model of an inhomogeneous electron gas, and (ii) two simple models of screened potentials at the surface based on reliable asymptotes in and outside the surface respectively. Though the results are clearly approximate attention is drawn especially to the predictions of the models concerning long-range dynamic interactions between adatoms on metal surfaces. (26 refs.)

114326 Propagation of high-intensity surface acoustic waves in lithium niobate. M.K.Balakirev, A.L.Belostotskii, L.A.Fedyukhin (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.191-3 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.339-42 (Feb. 1983). [received: Sept. 1983]

The results of an experimental investigation of the nonlinear propagation of surface acoustic waves along the free surface of lithium niobate are presented. For large initial surface acoustic wave amplitudes a surface shock wave is formed and propagates. The amplitude and phase relations between the spec-

tral components of this wave are determined, the wave profile on the surface is established, and the nature of the decline in intensity with distance is established. (7 refs.)

68.40 SURFACE ENERGY OF SOLIDS; THERMODYNAMIC PROPERTIES

- 114328 Surface tension of some rare-earth metals in the solid state. V.K.Kumykov, Kh.M.Guketlov (Kabardino-Balkarian State Univ., Nalchik, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.408-9 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- The zero-creep method was used to determine the surface tension of polycrystalline samples of solid iridium, hafnium, palladium, rhodium, strontium, and zirconium. The measurements were carried out in vacuum in the range of temperatures corresponding to the diffuse creep of samples. The values (with the exception of those for strontium) was approximately 10-30% higher than the surface tension in the liquid state. (8 refs.) A.T.
- 114329 The measurement of the surface tension of some pure metals in the solid state. V.K.Kumykov (Dept. of Phys., Univ. of Houston, Houston, TX, USA). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.L23-4 (Sept. 1983). Measurements of the surface tension of pure solid aluminum, beryllium, iron, titanium and rhenium are reported and are compared with previous work. The values obtained using the compensated zero-creep method are shown to be consistent with those in previous work but are of a higher accuracy than the previous values. (15 refs.)

(see also 82.65 Sorption and accommodation coefficients)

- 114330 A topological approach to studies of ordered structures of adsorbed gases in host lattices. I. The structure of γ -PdD_{0.5}. H.-G.Fritsche (Sektion Chem., Friedrich-Schiller-Univ., Jena, Germany), D.Bonchev, O.Mekenyan. *Cryst. Res. & Technol. (Germany)*, vol.18, no.8, p.1075-81 (1983). A graph-theoretical method is proposed which describes the deformation caused in the host lattice by adsorbed gas atoms, as well as their ordering. The method predicts correctly the ordered γ -phase of PdD_{0.5}. (20 refs.)
- 114331 Studies of the temperature dependence of gas adsorption data on graphite and boron nitride in terms of the partially mobile adsorption model. A.Patrykiewicz, M.Jaronec, A.W.Marczewski (Inst. of Chem., Marie-Curie-Sklodowskiej Univ., Lublin, Poland). *Chem. Scr. (Sweden)*, vol.22, no.3, p.136-45 (1983). A simple theory of partially mobile monolayer adsorption is presented. It is demonstrated that this theory properly predicts the critical parameters of monolayers of simple gases adsorbed on homogeneous surfaces. The comparison of theory with experimentally obtained adsorption isotherms for krypton, xenon, methane, and oxygen adsorbed on graphite, and for krypton, xenon, and methane adsorbed on boron nitride is presented. The model can be satisfactorily used for prediction of temperature dependence of adsorption isotherms. The molecular parameters characterizing adsorption systems can also be estimated, and in many cases they agree quite well with other estimations. (61 refs.)
- 114332 Adsorption of phosphoric acid solutions on the surface of solid oxides. O.S.Sirotkin, I.A.Zhenzhurist, R.S.Saifullin (S.M. Kirov Kazan' Chem.-Engng. Inst., USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1365-7 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1590-2 (Sept. 1982). [received: Sept. 1983]
- The authors present an investigation into the adsorption on model systems of the phosphoric acid-solid oxide support type. The initial solutions were 87, 60, and 40% aqueous solutions of phosphoric acid most often used for the production of phosphate binders. The supporting materials were the oxides MgO, Al₂O₃, SiO₂, and Cr₂O₃ of analytical grade. In order to increase the water resistance a small amount of phosphoric acid was added to the samples at a rate corresponding to R=0.2 (where R=P₂O₅/M₂O_n). The samples were

dried and the percentage of uncombined oxide in the adsorbants was calculated. (1 ref.)

- 114333 Pore size distribution in porous silicon studied by adsorption isotherms. G.Bomchil, R.Herino, K.Barla, J.C.Pfister (Centre Nat. d'Etudes des Telecommunications, Grenoble, France). *J. Electrochem. Soc. (USA)*, vol.130, no.7, p.1611-14 (July 1983). Porous silicon was obtained by anodic attack of single crystal silicon substrates in 25% hydrofluoric acid solutions. Specific surface area, total porous volume, and pore size distribution of porous silicon have been determined. The experimental technique used is based on the measurement of the volume of gas adsorbed at low constant temperature by the porous silicon. The adsorption isotherms show the general behavior found for porous materials, but at the same time, they show clear differences following different preparation conditions of porous layers. Quantitative analysis using models extensively used in the catalysis field lead to large values for the porous silicon specific surface area and sharp pore size distribution. Mean pore radii are found to vary in the range 20-100 Å when forming current density varies from 10 to 240 mA/cm². (12 refs.)
- 114334 Dynamics and mechanism of iodine sorption by polyacetylene. T.Danno, K.Miyasaka, K.Ishikawa (Dept. of Textile & Polymeric Materials, Tokyo Inst. of Technol., Ookayama, Meguro-ku, Tokyo). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.8, p.1527-37 (Aug. 1983). Sorption of iodine by bulk polyacetylene was studied under various I₂ gas pressures at 25°C. The sorption dynamics show that the penetration of iodine into PA is not Fickian and the diffusion coefficient increases with time of sorption. A discontinuous increase in the sorption isotherm is observed at P/P₀=0.25 (P is the pressure of the I₂ gas and P₀ is the saturation value at 25°C). It is due to iodine penetration into PA crystals, as evidenced by X-ray analysis. The distribution of iodine within crystals is apparently inhomogeneous: some unit cells are changed into 'iodine-PA' cells, while others remain unchanged. The electrical conductivity depends not only on the amount of iodine but also on the I₂ gas pressure under which sorption is carried out. At given iodine content, the conductivity of a sample doped under higher I₂ pressure is greater than that of a sample doped under lower pressure. (17 refs.)
- 114335 'Second component' effects in sorption and permeation of gases in glassy polymers. R.T.Chern, W.J.Koros, E.S.Sanders, R.Yui (Dept. of Chem. Engng., North Carolina State Univ., Raleigh, NC, USA). *J. Membrane Sci. (Netherlands)*, vol.15, no.2, p.157-69 (Sept. 1983). Data for CO₂ permeability through Kapton polyimide at 60°C are reported for upstream pressures up to 240 psia (16.33 atm) in the presence and absence of water vapor in the feed. The carbon dioxide flux was depressed by the presence of the water vapor. This phenomenon is analyzed in terms of the dual mode sorption and transport models. Together with other recent sorption and permeation data, the study suggests that competition of mixed penetrants for sorption sites and transport pathways associated with unrelaxed volume in glassy polymers is a general feature of gas/glassy polymer systems. The permselectivity of a membrane to a mixture of penetrants is strongly related to its ability to maintain a size and shape differentiating matrix, that is, to remain essentially unplasticized under operating conditions. Under such conditions, competition among penetrants for excess volume will be a generally important consideration for modeling gas permeation in permselective membranes. (21 refs.)
- 114336 Quantum motion of chemisorbed hydrogen on Ni surfaces. R.M.Puska (Lab. of Phys., Helsinki Univ. of Technol., Espoo, Finland), M.J.Nieminen, M.Manninen, B.Chakraborty, S.Holloway, J.K.Norskov. *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1081-4 (19 Sept. 1983). Quantum mechanical energy levels and wave functions have been calculated for the motion of chemisorbed hydrogen atoms on Ni surfaces. The results show considerable quantum effects for the adatom in both the ground and the excited states. The description of the adparticles as being delocalized along the surface offers a novel interpretation of several phenomena, in particular the vibrational excitations. (9 refs.)
- 114337 On the physisorption interaction of H₂ with Cu-metal. J.Harris, A.Liebsch (IFF, KFA, Jülich, Germany). *Phys. Scr. (Sweden)*, vol.T4, p.14-16 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982). The physisorption of H₂ on copper is discussed in the light of a recent theory of the helium-metal interaction. The theory relates the repulsive branch of the physisorption well to the scattering of individual evanescent band electrons by the ad-particle potential. Metal electrons are expelled from the region near the ad-particle and the band energy is driven up. The H₂-Cu physisorption well is found to be 23 meV deep, and only very weakly dependent on the orientation of the molecular axis. (16 refs.)
- 114338 Correlation between pair interactions of adsorbed atoms and adsorption layer superstructure formation. T.T.Tsong (Phys. Dept., Pennsylvania State Univ., University Park, PA, USA). *Phys. Scr. (Sweden)*, vol.T4, p.17-21 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982). When atoms adsorb on an atomically perfect surface, they often form a superstructured adsorption layer at sub-monolayer coverages. Although it is generally agreed that the lateral interactions between adatoms are responsible for the formation of adlayer superstructures, no direct experimental evidence exists. Using the field ion microscope, the author measured pair energies as function of distances for a few atomic pairs on the W (110) plane. In general, the interactions are nonmonotonic in distance dependence, and are about 100 meV in strength. The Si-Si interaction is most interesting. Using this data the relative two dimensional binding energy per adatom in an adsorption layer can be calculated. The author finds the (2√2/√3×4/√3) R35.26° superstructure, or in a conventional unit cell the p(2×1), has the lowest energy. The author's Monte Carlo simulation, which generates an adlayer of minimum free energy and maximum entropy consistent with the measured pair energies, also shows the same superstructure. Thus the lateral interaction of adatoms is indeed responsible for the adlayer superstructure formation, and the pair potential between two adatoms can now be measured from the FIM experiment with sufficient accuracy to correlate well with the formation of adlayer superstructure. No covalent bonds are formed between Si adatoms. (16 refs.)
- 114339 On the surface reaction of hydrogen with FeTi. A.S.Pedersen, P.J.Moller (Chem. Lab. IV, HC Ørsted Inst., Univ. of Copenhagen, Copenhagen, Denmark). *Phys. Scr. (Sweden)*, vol.T4, p.83-5 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982). The surface reaction of hydrogen (and of deuterium) with activated FeTi was studied by UHV volumetric vapour pressure measurements in the 3×10⁻⁸ Pa to 1.3×10⁻⁵ Pa range at 78K and 88K. At the low temperatures a dissociative nonactivated Temkin chemisorption process was found. An isosteric heat of adsorption, q, was described by the expression q=24(1-θ)kJ/(mole H₂) for a broad range of coverages. It was demonstrated that the dissociation

occurred on a nonoxidized Ti-surface and not—as has been suggested—on a segregated subsurface Fe-layer. (14 refs.)

114340 Coadsorption systems with electrochemical relevance: coadsorption of water with oxygen, bromine and sodium on Cu(110). D.E.Grider, K.Bange, J.K.Sass, G.Paolucci (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).

Phys. Scr. (Sweden), vol.T4, p.92-5 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

A unique approach of synthesizing the electric double layer at a metal-electrolyte interface under ultra-high vacuum conditions is briefly outlined. Results are presented of a study of water adsorption on clean Cu(110) using ultra-violet photoelectron spectroscopy (UPS), low energy electron diffraction (LEED), thermal desorption spectroscopy (TDS), as well as changes in the work function ($\Delta\phi$) as determined by the Kelvin method. In addition, changes in the nature of water adsorption due to the presence of coadsorbed oxygen, bromine, and sodium are also discussed. (24 refs.)

114341 Oxygen adsorption on a cylindrical GaAs single crystal prepared by molecular beam epitaxy. W.Ranke (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).

Phys. Scr. (Sweden), vol.T4, p.100-2 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The orientation dependence of oxygen adsorption was studied by AES and LEED using a cylindrical GaAs sample which exposes the low index orientations (001), (111), (110), (111), and (001) as well as all intermediate orientations on its surface. For the sample prepared by ion bombardment (IB) only, the adsorption is strong and nearly orientation independent. After ion bombardment and annealing (IBA), the oxygen adsorption on (001), (001) and (111) still is comparatively strong due to the influence of residual defects. In the range (331)-(110)-(111)-(113), a strong orientation dependence is observed which can be understood in terms of enhanced adsorption on edge adjacent sites. When the surface is prepared by molecular beam epitaxy (MBE), the overall amount of adsorbed oxygen is reduced indicating smaller defect concentrations. Also the orientation dependence becomes weaker. LEED observations show that in this case the regions between most of the low index orientations show only weak indications for steps but strong faceting which greatly reduces the edge site concentration. Obviously MBE promotes the formation of low index facets representing the state of lowest surface energy. However, in the range (110)-(111)-(112), also after MBE stable steps are formed which near (110) are two (110)-layers high. (13 refs.)

114342 Oxidation of Pb monolayers on Cu(100). D.Chadwick, M.A.Karolewski (Dept. of Chem. Engng. & Chem. Technol., Imperial Coll., London, England).

Phys. Scr. (Sweden), vol.T4, p.103-5 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The interaction of oxygen with Pb-covered Cu(100) surfaces in the range 0-1.2 monolayers has been studied by X-ray photoelectron spectroscopy. Oxygen reacts with the Pb overlayers to form lead monoxide. The oxidation rate of the overlayers decreases with increasing Pb coverage below 1 monolayer. Definite changes in reactivity can be observed at coverages where submonolayer structural changes have been reported. No evidence was found for the spill-over promotion of overlayer oxidation rate reported on other Cu surfaces. (22 refs.)

114343 Bromine and iodine adsorption on an Fe(100) surface. P.A.Dowben, M.Grunze (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany), D.Tomanek.

Phys. Scr. (Sweden), vol.T4, p.106-9 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The authors studied bromine and iodine adsorption on an Fe(100) surface in the temperature range of 110K to 700K. The authors compare core-level binding energies of dissociatively and molecularly adsorbed halogen species as a function of coverage. The valence band photoemission data suggest that bromine and iodine adsorption at 300K is always dissociative. At 110K, initial dissociative adsorption is followed by condensation of molecular halogens. At 300K the core-level binding energies E_B^F of bromine and iodine decrease as a function of coverage by 0.2 eV and 0.7 eV, respectively. The E_B^F values found for the condensed molecular species are identical to or even lower by 0.3 eV than for the room temperature saturated bromine and iodine overlayers, respectively. (15 refs.)

114344 Electron spectroscopy on adsorption of Cs on transition metals. P.Soukiasian, R.Riwan, C.Guillot, J.Lecante, Y.Borensztein (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).

Phys. Scr. (Sweden), vol.T4, p.110-12 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The electronic properties of Cs adsorbed on W(100) and Mo(100) are studied by ELS and UPS. For W(100), the main loss observed in ELS has a constant value of 1.5 eV for coverage θ between 0.6 and 1 monolayer while a small increase from 1.58 to 1.65 eV is observed for Cs on Mo(100). These results are in opposition to the energy loss increase on Cs adsorbed on Cu(111) which is found equal to $n^{1/2}$ (n being the surface atom density) and attributed to the excitation of a surface plasmon. An interband transition involving the Cs6s-6p resonances is postulated for Cs on Mo(100) and W(100). Preliminary UPS results indicate that the tungsten surface state observed at normal emission remains sharp and intense and suffers a 1 eV shift to higher binding energy but disappears on Mo(100). (23 refs.)

114345 Characterisation of a low temperature surface phase of CO on Pt {110}. P.Hofmann, S.R.Bare, D.A.King (Donnan Labs., Univ. of Liverpool, Liverpool, England).

Phys. Scr. (Sweden), vol.T4, p.118-21 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

Adsorption of CO on a Pt{110}(1 \times 2) surface precooled to 160K is found to proceed without loss of the (1 \times 2) reconstruction, in contrast to adsorption at higher temperatures. Using high resolution electron energy loss spectroscopy, the authors find that adsorption occurs initially into a linear species, with the additional occupation of bridged sites at fractional coverages above 0.2. At saturation, the ratio of bridged to linear species is 1:3. The absorption intensity from the linear species is shown to be 2.5 times that of the bridged species. Heating the saturated surface to temperatures between 280 and 340K results in an irreversible transformation of the bridged species to linear, and a lifting of the (1 \times 2) reconstruction to (1 \times 1). The orientation of CO molecules in the low temperature metastable phase on the (1 \times 2) surface was determined using angle-resolved photoemission, with electron collection in the plane orthogonal to the incidence plane. The CO molecules are found to be tilted away from the macroscopic surface normal, along the [100] azimuth, by $15\pm 5^\circ$. This contrasts with previous findings for the stable phase of CO on the annealed (1 \times 1) surface, where the tilt angle was found to be $26\pm 2^\circ$ along the [211] azimuth. (12 refs.)

114346 Ion scattering spectroscopy of β -N and β -Co ($\sqrt{2}\times\sqrt{2}$) R45° structures on W{100}. N.R.Palmer, D.A.King (Donnan Labs., Univ. of Liverpool, Liverpool, England).

Phys. Scr. (Sweden), vol.T4, p.122-5 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

Ion scattering spectroscopy has been applied in the present work in an attempt to determine the positions of N, C and O adatoms in the selvage of W{100}. LEED, AES, thermal desorption, and UPS were used to characterise the adsorbate structures. With the instrument, the incidence angle of the ion beam (He^+ , 1 keV) at the surface, the scattering angle, and the azimuthal angle, could be independently varied. For β -N, the results clearly favour the four-fold hollow site over the two-fold bridge or the on-top site at half monolayer coverage, with the adatoms shadowed by neighbouring surface W atoms at grazing incidence. For β -CO, the C and O adatoms again occupy the four-fold hollow sites; in this case, C (as with N) sits well into the hollow, being shadowed at grazing incidence by surrounding W atoms, while the O adatom sits slightly proud of the surface as shown by its shadowing neighbouring W atoms at grazing incidence. It is concluded that while C and N atoms are covalently bonded, the large radius of oxygen indicates ionic bonding. This study independently confirms and extends the previous LEED structural analysis of this system. (18 refs.)

114347 Photon stimulated desorption of ions from water and methanol adsorbed on a Ti(0001) surface. R.Stockbauer, D.M.Hanson, S.A.Flodstrom, E.Bertel, T.E.Madey (Surface Sci. Div., NBS, Washington, DC, USA).

Phys. Scr. (Sweden), vol.T4, p.126-8 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

Synchrotron radiation ($15\leq h\nu\leq 75$ eV) has been used to study ion desorption from water and methanol adsorbed on a Ti(0001) surface, in an effort to understand ion desorption from covalently bonded systems. Both water and methanol dissociate at all coverages upon adsorption on Ti at 300K. Using variable wavelength UPS, the adsorbed fragments OH, O and H are identified for water and CH_3O , C, O and H for methanol. At 90K, dissociation occurs initially to yield the same products, while at higher exposures, condensed overlayers are formed. PSD of ions from the two adsorbates show very different behaviour. In the water experiment, ion desorption originates from the dissociated species at both 300 and 90K. H^+ emission from dissociated water is correlated with the presence of OH on the surface while ion desorption from the ice multilayer is almost an order of magnitude less. In contrast, ion emission from the dissociated methanol is immeasurably low in the authors' instrument while a large H^+ signal is observed from the condensed layer. It is obvious that different molecular states are involved in the ion desorption in these cases. The H^+ emission from OH appears to be correlated with the O 2s level near 25 eV and the Ti 3p core level near 33 eV. However, ion desorption could arise strictly from different localized two hole states in OH. The H^+ observed from methanol appears to be initiated by ionization of the $4a'$ orbital with an onset near 18 eV. Using isotopic labelling experiments, it is shown that H^+ originates from the methyl group rather than the OH. (19 refs.)

114348 ESD spectra during adsorption at 300K and thermal desorption of $\text{H}_2/\text{W}(\text{poly})$. F.Gonzalez, J.L.de Segovia (Surface Phys. Lab., Inst. de Fisica de Materiales, CSIC, Madrid, Spain).

Phys. Scr. (Sweden), vol.T4, p.129-32 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The present work is related with the EDS spectra of the $\text{H}_2/\text{W}(\text{poly})$ system during the adsorption at 300K and thermal desorption processes. Significant differences with the usual spectra already described in the literature are found. They are characterized by a decrease of the maximum of the surface ion current of H^+ ($I^+(\text{H}^+)$), and a broadening of the peak with increasing pressure. Nevertheless, the ESD spectra during thermal desorption show that $I^+(\text{H}^+)$ reaches the same maximum value, irrespectively of the value obtained during the adsorption cycle. From the simultaneous ESD and thermal desorption spectra it is possible to establish a good correlation between $I^+(\text{H}^+)$ and p - t curves and, subsequently, with the desorbed entities (H_2). This relationship shows that there are four clearly different regions which can be assigned, at least in part, to the desorption states labelled β_1 , β_2 , β_3 and β_4 of polycrystalline samples. Using the $I^+(\text{H}^+)$ signal, the desorption energies and ion cross-sections have been determined for those states which are excitable electronically. (8 refs.)

114349 Floating phase in the chiral Potts model. A Monte Carlo renormalization-group analysis. J.M.Houlik, S.J.K.Jensen (Dept. of Phys. Chem., Aarhus Univ., Aarhus, Denmark), P.Bak.

Phys. Rev. B (USA), vol.28, no.5, p.2883-5 (1 Sept. 1983).

Layers of atoms or molecules adsorbed on surfaces may exhibit floating critical phases. To investigate this phenomenon the authors have developed a Monte Carlo renormalization-group scheme and performed calculations on the three-state chiral Potts model. The results indicate a continuous transition from a floating phase to a liquid phase at a temperature much higher than that found by series-expansion methods. (18 refs.)

114350 Phase diagrams of multilayer films and the Potts lattice-gas model of adsorption. C.Ebner (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).

Phys. Rev. B (USA), vol.28, no.5, p.2890-2 (1 Sept. 1983).

The Potts lattice-gas model is examined via Monte Carlo simulations and a mean-field approximation to obtain phase diagrams for multilayer adsorbed films. The advantage of the model is that it has three bulk phases, interpreted here as solid, liquid, and gas, allowing one to study the relationships between the phase transitions of the film and the bulk triple point. For the author's choices of coupling parameters, we find a solid film that wets the substrate and that melts, forming a liquid film, below the bulk triple-point temperature and either above or below the bulk roughening temperature. The liquid film wets the substrate above the bulk triple point but not below. (12 refs.)

114351 Negligible adsorbent cooling in thermal desorption. Z.W.Gortel, H.J.Kreuzer (Dept. of Phys., Dalhousie Univ., Halifax, Nova Scotia, Canada).

Surf. Sci. (Netherlands), vol.131, no.1, p.L359-66 (Aug. 1983).

A simple argument and a detailed calculation, the latter based on the master equation and the heat conduction equation, show that adsorbent cooling in thermal desorption is at best at the percent level. The time dependent temperature field in the surface region is calculated and discussed. (14 refs.)

114352 Absolute coverage measurements of deuterium on Ni(110). I.Stensgaard, R.Feidenhans'l (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).

Surf. Sci. (Netherlands), vol.131, no.1, p.L373-8 (Aug. 1983).

The absolute coverage of deuterium adsorbed on Ni(110) at temperatures below 170K to the formation of a (1 \times 2) LEED pattern has been determined by nuclear microanalysis (NMA). The result, $\theta_D = 0.96\pm 0.08$, is consistent with a saturation coverage of one full monolayer. Heating the crystal above $\sim 190\text{K}$ is shown to result in a gradual loss of deuterium from the system, accompanied by streaking of the LEED pattern, with complete desorption above $\sim 340\text{K}$. The low-temperature (2 \times 1)-D phase was found to correspond

to $\theta_D = 0.64 \pm 0.05$ monolayers. The results are expected to be valid also for the equivalent phases obtained by hydrogen adsorption. (17 refs.)

114353 An XPS study of carbon monoxide and nitric oxide adsorption on platinum (410): unusual dissociation activity. Y.O.Park, R.I.Masel (Dept. of Chem. Engng., Univ. of Illinois, Urbana, IL, USA), K.Stolt. *Surf. Sci. (Netherlands)*, vol.131, no.1, p.L385-9 (Aug. 1983). The adsorption of NO and CO on platinum (410) is studied by X-ray photoemission spectroscopy (XPS). It is found that the (410) surface shows unusual activity for NO and CO bond breaking. CO is found to adsorb molecularly on Pt(410) at 300K, but it partially dissociates upon heating to 500K. NO is found to adsorb dissociatively under all conditions studied. By comparison, the low index faces of platinum and stepped surfaces considered previously give negligible dissociation of CO and negligible dissociation of NO up to 450K. The (410) surface is also unusual from an orbital symmetry standpoint; in fact, it was predicted to be unusually active for NO and CO bond breaking based on Woodward-Hoffman ideas. The present results show, then, that Woodward-Hoffman (i.e. orbital symmetry conservation) methods could yield valuable insights into the nature of active sites on single crystal catalysts. (17 refs.)

114354 Theoretical study of oxygen chemisorption on zinc surface by cluster models. E.Miyazaki (Dept. of Chem., Tokyo Inst. of Technol., Tokyo, Japan), M.Tsukada, H.Adachi. *Surf. Sci. (Netherlands)*, vol.131, no.1, p.L390-8 (Aug. 1983). Theoretical calculations by DV-X α -MO have been performed for clusters representing a Zn(0001) surface with oxygen. The calculated DOS is in good agreement with the experimental UPS spectra found by Briggs (1975) or by Abbati et al. (1977). A large amount of electron flow from Zn atoms into the oxygen atom occurs and this causes (1) a remarkable upward shift of the oxygen 2p level and (2) formation of an unoccupied level near the highest occupied level. The bonds between the oxygen 2p and the zinc 4s or 4p orbitals have a strong bonding character, and the contribution of the zinc 3d orbital to the Zn-O bond is not important. (12 refs.)

114355 Adsorption and decomposition of ammonia on W(100): XPS and UPS studies. C.Egawa, S.Naito, K.Tamaru (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan). *Surf. Sci. (Netherlands)*, vol.131, no.1, p.49-60 (Aug. 1983). The adsorption and decomposition of ammonia on a clean and c(2 \times 2)-N ordered W(100) surface has been studied by photoemission spectroscopy (XPS and UPS). At 120K molecularly adsorbed ammonia was identified by N(1s) core level emission at 400.9 eV and the valence emissions at 7.6 and 11.7 eV. By heating the sample stepwise the N(1s) core level shifted to lower binding energy. In the valence region, the corresponding spectral changes were obtained, where the dependence of the peak intensity on photon energy was observed. These observations were interpreted to demonstrate that adsorbed ammonia dissociates its hydrogen successively to form NH₃(a) and finally to atomic nitrogen. On the other hand, ammonia was molecularly adsorbed on a c(2 \times 2)-N ordered surface even at temperatures as high as 300K, although the spectra at 400K or above were very similar to those under a steady state flow condition, where the tungsten surface was mostly covered by atomic nitrogen. At higher ammonia pressure up to about 100 Pa thicker nitride layers were formed at 700K, which were characterized by the N(1s) core level at 397.3 eV and a broad emission around 6 eV in the valence level. (16 refs.)

114356 Thermodynamics of xenon adsorption on Pd(s)[8(100) \times (110)]: from steps to multilayers. R.Miranda, S.Daiser, K.Wandelt, G.Ertl (Inst. fur Phys. Chem., Univ. Munchen, Munchen, Germany). *Surf. Sci. (Netherlands)*, vol.131, no.1, p.61-91 (Aug. 1983). The thermodynamic properties of the adsorption of xenon on the stepped Pd(s)[8(100) \times (110)] surface have been studied over a wide range of pressure (5×10^{-11} to 1×10^{-4} Torr) and temperature (40-140K). The authors have measured adsorption isobars using AES in order to evaluate the surface coverage. By choosing pressure and temperature they have studied under equilibrium conditions the successive adsorption of xenon on the steps and on the terraces until the first layer is formed, the condensation of the second layer as well as the formation of xenon multilayers. For a small range of pressure and temperature, adsorption takes place only on the atomic steps. The LEED pattern shows that only every other site along the steps is occupied. The extrapolated initial heat of adsorption for steps is $E_{ad}^S = 10.2$ kcal/mol, decreasing monotonically by about 2 kcal/mol as the relative coverage of the sites increases. The dipole moment of the Xe atoms adsorbed on steps is 1.12 D. During adsorption on the terraces the LEED observations suggest that the xenon adlayer is non-localized up to completion of the hexagonally close packed monolayer. The initial heat of adsorption on the terraces, E_{ad}^T is 8.2 kcal/mol and decreases continuously to a value of 6.9 kcal/mol for a complete monolayer due to lateral repulsive interactions between the adsorbed xenon atoms. (65 refs.)

114357 On the role of image forces in chemisorption theory. O.M.Braun (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR), A.I.Volokitin. *Surf. Sci. (Netherlands)*, vol.131, no.1, p.148-58 (Aug. 1983). The Extended Anderson Hamiltonian is used to study the effect of fluctuations of an adatom charge Q on the ionic part of the chemisorption energy. It is shown that dynamical effects essentially modify the classical expression $E = -\phi Q^2$ for the energy of interaction between a static charge Q and a metal (ϕ is the interaction energy for a unit charge). The exact solution for the one-electron two-level model as well as a variational solution for the Extended Anderson Hamiltonian model are given. Validity conditions for a variety of approximate schemes are studied. The results are presented for the Extended Anderson Hamiltonian model parameterized so as to describe some aspects of the Li/W and Li/Mo chemisorption systems. (15 refs.)

114358 Site-specific interaction of H₂O with ZnO single-crystal surfaces studied by thermal desorption and UV photoelectron spectroscopy. G.Zwicker, K.Jacobi (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany). *Surf. Sci. (Netherlands)*, vol.131, no.1, p.179-94 (Aug. 1983). The adsorption and condensation of H₂O (D₂O) on ZnO(10 $\bar{1}$ 0), (0001)Zn and (0001)O surfaces was investigated by means of thermal desorption (TDS) and UV photoelectron spectroscopy (UPS). The clean ZnO single-crystal surfaces were prepared by Ar-ion sputtering and annealing and characterised by Auger electron spectroscopy, LEED, UPS and work-function measurements. On all three surfaces six different adsorption states were found. In the monolayer regime there is a stronger bonding to Zn sites (desorption temperature 340K) than to O sites (190K). The bonding to the Zn sites seems to be accompanied by some clustering. Before the chemisorption layer is completed a first ice state is found whose desorption temperature shifts from 162 to 168K with increasing exposures. At higher exposures the multilayer ice state is found at 152K. On the (0001)O face defect-induced features were identified. The water lone-pair orbital 1b₁, whose energy falls between the O p and Zn 3d emission of the substrate and which is known to show bonding shifts, was analysed using angle-resolved UPS. In the monolayer, the main chemisorption states are found at $E_B^V(1b_1) = -9.6$ eV for the (0001)Zn face

and at -10.6 eV for the (0001)O face and are compared with the multilayer ice emission at -11.1 eV. The difference in binding energies shows the same trend at the TDS data. For the (1010) face the 1b₁ emission is very broad, indicating some overlap between different states. (18 refs.)

114359 Classical stochastic diffusion theory for desorption from solid surfaces. Y.Zeiri, A.Redondo, W.A.Goddard, III (Arthur Amos Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA). *Surf. Sci. (Netherlands)*, vol.131, no.1, p.221-38 (Aug. 1983). The authors present a theory of desorption of atoms and molecules from solid surfaces based on a classical stochastic diffusion formulation. They obtain a simple rate expression which has the form $R = (\Omega_0/2\pi) f(T) \exp(-D_c/kT)$, where T is the temperature, k is Boltzmann's constant, D_c is the bond enthalpy and Ω_0 is the surface-adsorbate vibrational frequency. For atoms $f(T) = 1$, while for molecules $f(T)$ depends on the parameters for the frustrated rotations at the surface. Application of this theory is reported for the desorption of atoms and molecules. They find that molecules lead to a greatly increased (factor of 100) Arrhenius preexponential factor in excellent agreement with experiment. (18 refs.)

114360 The adsorption of methane on polycrystalline iron films. G.Wedler, M.Mengel (Inst. fur Phys. und Theoretische Chemie., Univ. Erlangen-Nurnberg, Erlangen, Germany). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.L423-8 (Sept. 1983). The adsorption of methane on evaporation iron films at 77K is discussed by means of adsorption isotherms, changes in resistance and work function. The thermal desorption spectrum shows only one peak at about 130K. There is no adsorption of methane at 273K. The results are compared with those found for methane adsorption on nickel films. (15 refs.)

114361 Kinetics of nitrogen adsorption on iron. J.Boheim, W.Brenig (Dept. of Phys., Tech. Univ. Munchen, Munchen, Germany). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.258-72 (Sept. 1983). A model for the dissociative adsorption of N₂ on Fe single crystals is investigated, in which the sticking of N₂ proceeds via a precursor. In particular, a situation is discussed where the translational energy of incident N₂ is of the order of the activation barrier between the molecular precursor and the chemisorbed state. It turns out that in this case the energy transfer to phonons is greatly reduced. The rotational degrees of freedom are taken into account only in a very rough way in a kinetic equation: The detailed balance relations for the kinetic coefficients i in this equation contain rotational partition functions, describing free rotations in the gas phase and assuming totally frozen rotations in the precursor. A consequence of the reduced energy transfer and the freezing of rotations is an anomalously low overall sticking coefficient in agreement with the experimental results of Ertl, Lee and Weiss (1982). The angular distribution of inelastically scattered N₂/Fe was measured and found to be unusually narrow, again consistent with the prediction of an unusually low energy transfer. (11 refs.)

114362 Chemisorption properties of thin Pd overlayers on Nb (110) and Ag (111). J.P.Muscat (Dept. of Appl. Math., Univ. of Waterloo, Waterloo, Ontario, Canada). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.299-308 (Sept. 1983). A simple model of hydrogen adsorption on a Pd covered Nb (110) substrate is presented. In agreement with recent experiments, it is found that for the commensurate BCC (110) phase, dissociation H₂ adsorption is not favoured in contrast to the incommensurate FCC (111) phase. The major reason for the dramatic reduction in surface reactivity for the BCC (110) phase, is due to the increase in Pd-Pd distances which results in a narrowing of the d band and also a lowering of the antibonding resonance made up of the H 1s orbital and the substrate d states, to an energy position where it is now occupied. A similar behaviour is expected for H adsorbed on a Pd/Ag (111) composite substrate, where at low Pd coverages (less than one monolayer) the expanded Pd layer is expected to act against the H₂ dissociation. Calculations of the one-electron energies due to the metal d states for H and Pd and Nb surfaces, indicate a larger chemisorption energy for Nb than Pd. The H-surface bond is thus more easily broken for a Pd covered Nb surface, than for a clean Nb surface, thereby resulting in a faster H penetration into the bulk of the composite substrate. (23 refs.)

114363 Effects of oxygen adsorption on the LEED fine structure features of Cu (001), Cu (110), Cu (111) and Ni (001). S.M.Thurgate, P.J.Jennings (School of Math. & Phys. Sci., Murdoch Univ., Murdoch, Australia). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.309-20 (Sept. 1983). The effect of adsorbed oxygen on the LEED fine structure features of Cu (001), Cu (110) and Cu (111) is investigated. The adsorption process is followed by AES and CPD measurements. Changes in the relative intensity of the fine structure features are related to changes in the surface order and smoothness. It is empirically established that a rough surface produces relatively weak fine structure features compared with a similar smooth surface. This is attributed to a reduction in reflectivity of the surface potential barrier. It is also shown empirically that increasing disorder on the crystal surface leads to a preferential damping of the fine structure close to the emergence. This effect is seen in the change of the relative intensity of the fine structure features during the adsorption of oxygen. Observations of these features are used to test several models proposed for the oxygen adsorption sites on these surfaces. (18 refs.)

114364 Semi-empirical calculation of H atom interaction with a 12 atom iron cluster. G.Blyholder, J.Head, F.Ruette (Dept. of Chem., Univ. of Arkansas, Fayetteville, AR, USA). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.403-18 (Sept. 1983). Calculations have been made using the MINDO/SR procedure for Fe₂, Fe₁₂, FeH and Fe₁₂H. The order of stability for H on Fe (100) symmetric sites is bridge > 4-fold > linear. Adsorption on edges is favored over center sites. The most stable plane site was a displaced bridge site. The H atom charges in the 4-fold, bridge and linear sites are +0.16, +0.03, and -0.17e respectively. The vibrational frequencies are 1150, 1340 and 1950 cm⁻¹, respectively. No simple correlation of H binding energies with coordination numbers was found to exist. The calculations correlate the binding energy, vibrational frequency, work function change, photoelectron spectra and LEED data into a consistent view. (31 refs.)

114365 Interactions of sulfur with nickel surfaces: adsorption, diffusion and desorption. M.Blaszczyszyn, R.Blaszczyszyn, R.McClews (Inst. of Experimental Phys., Univ. of Wroclaw, Wroclaw, Poland), A.J.Melmed, T.E.Madey. *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.433-47 (Sept. 1983). The kinetics of adsorption, surface diffusion and thermal desorption of sulfur on Ni surfaces have been studied using field electron emission microscopy methods. The sticking probability for elemental sulfur sublimed onto a Ni specimen is approximately unity for Ni substrate temperatures from 77 to 530K. The maximum average work function for ~monolayer coverage of S ranged from 4.7 to 5.05 eV in different experiments; for fractional monolayer doses of S, surface diffusion was rapid at $T > 400$ K, with activation energies ranging from 15 to 28 kcal/mol. For multilayer adsorption of sulfur, diffusion

occurs without motion of a sharp boundary, and there is evidence of extensive surface reaction between S and Ni (emission from small 'crystallites' is evident in the field emission patterns). Sulfur desorbes for Ni at temperatures above 1500K. (17 refs.)

114366 Electron-enhanced CO₂ adsorption and stabilization on aluminum films. J.L.Falconer, S.D.Bischke, G.J.Hanna (Dept. of Chem. Engng., Univ. of Colorado, Boulder, CO, USA).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.455-62 (Sept. 1983).
The rate of carbon dioxide adsorption and surface oxidation on aluminum films is significantly enhanced by an electron beam. Though oxygen accumulates in the beam-exposed area, carbon does not significantly accumulate on the surface; apparently the electron beam dissociates CO₂ to oxygen and carbon monoxide, which desorbs. The surface concentrations of oxygen and aluminum oxide are measured by Auger spectroscopy at locations that were exposed and not exposed to the electron beam during adsorption. These measurements show that an oxide can be formed with a sharp concentration gradient on the surface. The oxide formed by electron beam enhancement is not stable and can apparently diffuse into the bulk. However, this oxide can be stabilized by additional electron beam exposure in the absence of gas-phase carbon dioxide. (21 refs.)

114367 A model for non-adiabatic coupling on metals: the sticking problem. G.P.Brivio (Istituto di Fisica, Univ. di Milan, Milan, Italy), T.B.Grimley.

Surf. Sci. (Netherlands), vol.131, no.2-3, p.475-90 (Sept. 1983).
A simple quantum model is introduced to deal with the continuum of electron-hole pair excitations produced by a reactive gas atom moving near a metal surface. The sticking coefficient due to the electron-hole pair mechanism is defined for both box- and δ -function-normalization of the gas atom's nuclear wavefunctions, and the equivalence of the two definitions is proved for a large box. The sticking coefficient is calculated in the distorted wave Born approximation for hydrogen atoms with kinetic energies in the range 0-80 meV. It shows a maximum at about 21 meV due to a quantum mechanical resonance in the transmission of the hydrogen atom into the chemisorption potential well. The maximum value of the sticking coefficient is 0.4. The role in electron-hole pair sticking of the spectral density at the Fermi level of the surface bond order is emphasized, and discussed. (11 refs.)

114368 Numerical simulations of adatom pair distribution functions. H.K.McDowell, S.M.Valone, J.D.Doll (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.511-16 (Sept. 1983).
Numerical simulations of the pair correlation for two adatoms on a solid surface with smooth (Lennard-Jones) pair potentials as input exhibit long range oscillations in spite of the low adatom density. Other simulations of a pair distribution with only the adatom-adatom interaction switched off show that this distribution may be combined with the experimental pair distribution to provide an estimate of the adatom interaction. (6 refs.)

114369 Adsorption of mixtures of methane and krypton on CaA zeolite. II. Analysis of the experimental data using Freundlich- and D dubinin-Radushkevich-type equations derived by assuming similar heterogeneity parameters for single-gas adsorption. M.Jaroniec, J.Piotrowska (Dept. of Theoretical Chem., Inst. of Chem., Maria Curie-Sklodowska Univ., Lublin, Poland), M.Bulow.

Thin Solid Films (Switzerland), vol.106, no.3, p.219-24 (19 Aug. 1983).
Equations for mixed-gas adsorption isotherms were derived on the basis of the integral equation of the adsorption isotherm by assuming constant differences in the adsorption energies for all types of adsorption sites. The application of Freundlich- and Dubinin-Radushkevich-type isotherms to the interpretation of experimental data for methane-krypton mixtures is also presented. (12 refs.)

114370 Construction of an Eisenman series for an ion-exchange material containing phosphate groups. E.D.Lavrinenko-Ometinskaya, V.V.Strelko (Inst. of General & Inorganic Chem., Acad. of Sci., Kiev, Ukrainian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.6, p.680-2 (Nov-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.737-40 (Nov-Dec. 1982). [received: Sept. 1983]

A major problem is to develop scientifically sound methods of synthesizing sorbents of specific performance, in particular in relation to given substances. Particular interest attaches to inorganic ion-exchange materials, which sometimes show unique selectivity in the sorption of ions from solutions of complicated composition. The authors use a model discussion of alkali metal sorption by inorganic sorbents with phosphate groups to show that it is possible to construct selectivity series by quantum-chemical calculation. The basis is Eisenman's simple scheme for selective absorption (1972), which is represented as competition between the cation and the solvent molecules in the interaction with the counterion in the sorbent matrix. (11 refs.)

114371 Adsorption behaviour of pure fluids near the gas-liquid critical point. G.H.Findenegg (Phys. Chem. II, Ruhr-Univ. Bochum, Bochum, Germany).

Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.385-91

The interface between a nonreactive solid and a fluid near its critical point is investigated. Whereas the interface between near-critical fluid phases disappears as the critical point is approached through the range of two-phase states, the interface between a near-critical phase and a noncritical phase exhibits pronounced adsorption phenomena, due to the long range of the coherence length of density (or concentration) fluctuations in the critical region. The theoretical background of these phenomena is discussed on the basis of Widom's theory. Experimental measurements for the adsorption of fluids (ethylene, SF₆) on the basal plane of graphite are reviewed. Finally, a new apparatus for extending these measurements to the near-critical region of pure fluids in a low-gravity environment is described. (19 refs.)

68.48 SOLID-SOLID INTERFACES (inc. bicrystals; for grain boundaries, see 61.70N)

114372 Studies of chemistry at the Ta/Si interface as a function of thermal processing. P.W.Lew, C.R.Helms (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA), T.M.Reith.

J. Electrochem. Soc. (USA), vol.130, no.8, p.1730-5 (Aug. 1983).
Ta and Ta-oxide Schottky barrier diodes structures on n-type (100) Si substrates were prepared under various standard processing conditions using either sputter deposition or electron beam (E-beam) evaporation, and these samples were analyzed for their oxygen and carbon content using high resolution Auger sputter profiling. The authors found that the bulk Ta of the sputter-deposited and E-beam-deposited Ta films contain 3 atomic percent (a/o) oxygen. In addition, E-beam-deposited Ta films contain approximately 0.3 a/o carbon in the bulk and 1-3 a/o carbon at the interface. Photoresist use prior to deposition left residual carbon at the Ta-Si interface, and this carbon remained intact after an anneal of 400°C for 1 hr in vacuum. Oxygen present in Ta-oxides at the Ta-Si interface diffused away from the interface and tended to redistribute itself uniformly throughout the Ta layer for anneals of 400°C for 1 hr. Greater redistribution occurred for annealing at 450°C for 3 hr. (9 refs.)

114373 Characterization of the oxide-metal interface at the surface of a stainless steel. G.C.Allen, R.K.Wild (Berkeley Labs., CEBG, Berkeley, England), M.Weiss.

Philos. Mag. A (GB), vol.48, no.3, p.373-86 (Sept. 1983).
The alloy-oxide interface from 20 at.% Cr-25 at.% Ni-1 at.% Nb stabilized steel oxidized at 850°C in CO₂/1% CO has been examined on both sides using scanning Auger electron spectroscopy. The interface which was exposed using a sputter ion-plating technique consists of a silicon-rich chromium sesquioxide. When the oxide separates it does so at this interface within the silicon-rich layer. (8 refs.)

114374 RF plasma annealing of as-grown defects in the Si/SiO₂ system. A.Szekeress, S.Alexandrova (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria).

Thin Solid Films (Switzerland), vol.106, no.3, p.153-8 (19 Aug. 1983).
The annealing effect of an RF hydrogen plasma on the interface properties in Si/SiO₂ systems was investigated. The fixed oxide charge is found to be sensitive to the low temperature plasma annealing. Annealing is more effective at higher temperatures and when applied to metallized structures. With bare oxides the generation of slow states is observed whose concentration depends on the substrate temperature. A final 450°C hydrogen anneal gives very low fixed charge densities. Comments on the annealing mechanism are also given. (14 refs.)

114375 Microstructural study of alumina/TiC coated cemented carbide. S.Vuorinen (Lab. of Appl. Phys. I, Tech. Univ. of Denmark, Lyngby, Denmark).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.357-62
The aim of the author's transmission electron microscope (TEM) study of the alumina/TiC double coating deposited on cemented carbide substrate has been to characterize the microstructures present at different levels in the

double coating. The microstructures of the alpha-alumina ($\alpha\text{-Al}_2\text{O}_3$) layer, the intermediate titanium carbide (TiC) layer and the microstructure of the TiC/cemented carbide interface are reported. The results are compared with previous related studies of the single TiC coated cemented carbide microstructure. The Al_2O_3 /TiC interface, which seems initially to be less complicated than the TiC cemented carbide interface is not dealt with in this connection. (4 refs.)

68.55 THIN FILM GROWTH, STRUCTURE, AND EPITAXY

(for techniques of crystal growth and film deposition, see 81.10 and 81.15)

114376 Study of the uniformity and stoichiometry of CoSi_2 films using Rutherford backscattering spectroscopy and scanning electron microscopy. K.Ishibashi, S.Furukawa (Dept. of Appl. Electronics, Graduate School of Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan). *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.660-2 (1 Oct. 1983).

Uniformity and stoichiometry of solid phase epitaxial CoSi_2 films were investigated by Rutherford backscattering spectroscopy (RBS) and scanning electron microscopy (SEM). In a series of samples, small deviations of the composition ratio from the silicide stoichiometry were always observed in the RBS spectra for the films. Furthermore, it was found from SEM observation that these films were not uniform and the surfaces of the samples consisted of two kinds of materials. From these results and the spectra of micro Auger electron spectroscopy, it was concluded that the surfaces of the samples consisted of a stoichiometric CoSi_2 region and exposed Si regions. (8 refs.)

114377 Thermal nitridation of silicon in nitrogen plasma. H.Nakamura, M.Kaneko, S.Matsumoto (Dept. of Electrical Engng., Keio Univ., Yokohama, Japan), S.Fujita, A.Sasaki. *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.691-3 (1 Oct. 1983).

Direct thermal nitridation of silicon in a nitrogen plasma has been performed above 1000°C . From an Auger electron spectroscopy analysis, the formed films contain some oxygen and are identified as oxynitride films. The refractive indices of these films varied from 1.5 to 1.9 with nitridation time. The film thickness is about 40 \AA after nitridation of 10 h at 1145°C and the film growth is saturated at this value. Capacitance-voltage characteristics of Al gate metal-nitride-semiconductor capacitors show a stable behavior. The fixed charge density Q_{ss} is estimated to be on the order of 10^{12} cm^{-2} . (8 refs.)

114378 On the substructure of epitaxial (Pb,Sn)Te films grown on KCl cleavage faces. M.Schenk, Ngo Dien Tap (Sektion Phys., Humboldt-Univ., Berlin, Germany).

Cryst. Res. & Technol. (Germany), vol.18, no.8, p.997-1001 (1983). The X-ray diffraction rocking curve analysis has been employed for the measurement of crystallite sizes of (Pb,Sn)Te films for different thickness, epitaxially grown on KCl cleavage faces by the hot-wall technique. The size of the coherently scattering regions parallel to the reflecting planes did not depend on film thickness and agreed with the mean distance of nuclei just before coalescence investigated by means of replica electron microscopy. The results are consistent with a model of stalk-like growth of crystallites in film growth direction. (11 refs.)

114379 TEM-electron energy loss spectroscopy study of the diamond particles prepared by the chemical vapour deposition from methane. Y.Matsui, S.Matsumoto, N.Setaka (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.532-4 (Sept. 1983). The authors report the results of their TEM-EELS characterisations of particles grown by S. Matsumoto et al.'s CVD method (1982). The Debye-Scherrer rings in the diffraction pattern of the particles were reasonably indexed based on the diamond structure. It was experimentally confirmed, through the EELS and EDX microanalyses that the particles were composed only of C atoms. The profiles of both the plasmon loss spectra and the near edge fine structures in the EELS were very similar to those of previous data on diamond. (12 refs.)

114380 Structure of two-layer epitaxial Ag-Al films. V.M.Ievlev, E.K.Belonogov (Polytech. Inst., Voronezh, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.322-6 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A clear noncoherent Ag-Al interface formed only when an Al film was grown on a (111) Ag film at substrate temperatures $T_s \geq 300\text{K}$. At high values of T_s the structure was characterized by the presence of hexagonal networks of misfit dislocations with the Burgers vector $1/2\text{ [110]}$ lying in the plane of the interface. The structure was then determined by the ratio of the thicknesses of the two metal layers and its formation was accompanied by the appearance of an intermetallic phase. The irregularity of the network period was attributed to the nonuniform nature of the process of mutual diffusion within the film. (6 refs.) A.T.

114381 Kinetics of structural multiplets during diffusion homogenization of polycrystalline films. L.A.Yudina, E.L.Fedorova, G.P.Timakova, L.M.Antonova, V.A.Gulenko, V.V.Yudin (Far-East State Univ., Vladivostok, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.351-7 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. Thin polycrystalline Permalloy films were prepared by vacuum evaporation. The processes of diffusion homogenization during high-temperature annealing, resulting in macrodiscontinuities, were studied. Electron microscopy and coherent optics were used to identify the structural multiplets and to study their kinetics during high-temperature isothermal annealing. Ways of increasing the stability of the magnetic structure of planar memory materials were suggested. (25 refs.) A.T.

114382 Orientation and structure of bismuth films on virgin surface of zinc. N.V.Barmina, V.M.Ievlev (Polytech. Inst., Voronezh, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.413-16 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A study was made of the orientation and substructure of bismuth films condensed on virgin (00.1) surfaces of Zn. The study was carried out by electron diffraction and electron microscopy methods. The films had three equivalent orientations so that their structure was polycrystalline. Twinning was also observed. (12 refs.) A.T.

114383 Properties of films of GaP on Si obtained by ion-liquid epitaxy. N.N.Gerasimenko, L.V.Lezheiko, E.V.Lyubopytova, S.M.Pintus, A.G.Sharshunov (Inst. of Phys. of Semiconductors, Acad. of Sci., Novosibirsk, USSR). *Inorg. Mater. (USA)*, vol.18, no.10, p.1451-4 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1689-92 (Oct. 1982). [received: Sept. 1983]

By injecting phosphorus ions into a gallium melt on the surface of silicon at $300\text{--}500^\circ\text{C}$ it is possible to obtain epitaxial temperature-stable low-defect GaP films with n-type conductivity. By changing the synthesis temperature it is possible to control the concentration of charge carriers in the films over a wide interval. (10 refs.)

114384 Properties of molybdenum silicide film deposited by chemical vapor deposition. S.Inoue, N.Toyokura, T.Nakamura (Fujitsu Labs. Ltd., Kawasaki, Japan), M.Maeda, M.Takagi. *J. Electrochem. Soc. (USA)*, vol.130, no.7, p.1603-7 (July 1983).

MoSi_2 films used as gate electrodes and interconnects were deposited on oxidized Si substrates via reactions between MoCl_5 and SiH_4 . At high temperatures, HCl generated by reactions involving MoCl_5 , H_2 , and SiH_4 reacts with Si to form volatile SiH_3Cl , SiH_2Cl , SiHCl_3 , and SiCl_4 ; thus Si is etched away and is not available to form MoSi_2 , resulting in deposited film consisting of only metallic Mo. At low temperatures, the deposited film consists of MoSi_2 , which is thermodynamically stable. The deposited films show characteristics (resistivity, crystal structure, and so forth) similar to those of MoSi_2 films deposited by sputtering. Chlorine in the deposited films has a gettering effect for mobile ions such as Na^+ . (10 refs.)

114385 Crystallographic orientation and surface morphology of chemical vapor deposited Al_2O_3 . C.-S.Park, J.-G.Kim, J.S.Chun (Dept. of Materials Sci. & Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1607-11 (July 1983). Deposits of aluminum oxides (Al_2O_3) have been formed by a chemical vapor deposition technique involving the application of gaseous mixtures of AlCl_3 , CO_2 onto TiN-coated cemented carbide substrates. Reaction parameters (deposition temperature, system pressure, and composition of reactant gases) and their effects on the crystalline structure, crystallographic orientation, and surface morphology of the Al_2O_3 deposit have been studied. Al_2O_3 crystals maintain a corundum structure throughout the entire range of deposition conditions. Crystals of Al_2O_3 appear to nucleate in random orientations on the TiN layer, and further growth proceeds with (1014) and (1126) preferred orientations. The effects of reaction parameters on the final surface morphology of the Al_2O_3 deposit can be described by considering the supersaturations of the reactants and the growth rate. The crystals of the Al_2O_3 deposit become finer and more uniform as the supersaturation of the reactant controlling the Al_2O_3 nucleation increases. (10 refs.)

114386 A new electrodeposited oxide film containing lead and thallium with the cubic fluorite-type structure. M.Sakai, T.Sekine, Y.Yamazaki (Dept. of Electronic Chem., Tokyo Inst. of Technol., Yokohama, Japan).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1631-3 (July 1983). A new compound having the cubic fluorite-type structure was obtained by means of the anodic oxidation of the mixture of Pb (II) and Tl (I) under a certain electrolytic condition. The obtained electrodeposited oxide on the platinum substrate was black with metallic luster and had a good electric conductivity. The composition of the electro-deposited oxide was determined as $\text{Pb}_3\text{Tl}_2\text{O}_{24}$. (6 refs.)

114387 Mathematical modeling of high-current chromium plating with application of a rotating disk electrode. I.Drela, W.Popytak, J.Kubicki (Politech. Wroclawskiej, Wroclaw, Poland).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1671-6 (Aug. 1983). Based on a mathematical design of experiments, the effect of temperature, current density, H_2SO_4 , and K_2SiF_6 concentrations, and hydrodynamic conditions on the current efficiency, electrical energy consumption, speed of deposition, gloss, and the microhardness of chromium coatings obtained at current densities of $200\text{--}400\text{ A/dm}^2$ was investigated. The results are presented by means of regression equations in the form of quadratic polynomials. (17 refs.)

114388 Si on cubic zirconia. H.M.Manasevit, I.Golecki, L.A.Moudy, J.J.Yang, J.E.Mee (Microelectronics Res. & Dev. Center, Rockwell Internat., Anaheim, CA, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1752-8 (Aug. 1983). Epitaxial growth of single-crystal Si films has been realized on the (100), (110), and (111) crystallographic planes of yttria-stabilized, cubic zirconia single crystals. The Si films were grown by chemical vapor deposition, using the pyrolysis of SiH_4 at temperatures in the range $950\text{--}1075^\circ\text{C}$ and at deposition rates of $0.08\text{--}1.2\text{ }\mu\text{m/min}$. A predeposition annealing procedure has been developed, resulting in a quasi-stable, oxygen-deficient zirconia surface. A model is presented to explain the dependence of oxygen kinetics in cubic zirconia on temperature and yttria content. The heteroepitaxial Si films have been characterized by optical and scanning electron microscopies, reflection electron diffraction, X-ray diffraction, Rutherford backscattering and channeling, and surface electrical conductivity and Hall effect measurements. Several $0.4\text{--}0.5\text{ }\mu\text{m}$ thick (100)- and (110)-oriented Si films on cubic zirconia were found to be of higher crystal quality than commercial (100) Si on sapphire films of similar thickness. (32 refs.)

114389 Liquid phase epitaxial growth of $\text{In}_{1-x}\text{Ga}_x\text{P}_{1-y}\text{As}_y$ on GaAs substrates. S.Kaneishi, T.Takenaka, S.Yano, T.Hijikata (Central Res. Labs., Sharp Corp., Tenri, Japan).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.498-504 (Aug. 1983). $\text{In}_{1-x}\text{Ga}_x\text{P}_{1-y}\text{As}_y$ layers were grown on GaAs substrates by LPE at 700°C . A great difference was found between the growth on (100) and (111)B substrates. On (100) substrates, mirror-like $\text{In}_{1-x}\text{Ga}_x\text{P}_{1-y}\text{As}_y$ ($y < 0.01$) layers were obtained with a lattice mismatch ranging from 0 to 0.32%. $\text{In}_{1-x}\text{Ga}_x\text{P}_{1-y}\text{As}_y$ ($y \geq 0.01$) layers had flat interfaces but their surfaces were rough. On the other hand, mirror-like $\text{In}_{1-x}\text{Ga}_x\text{P}_{1-y}\text{As}_y$ ($0 \leq y \leq 0.5$) layers were obtained on (111)B substrates with a smallest mismatch of about 0.5%. The composition range of mirror-like layers was dependent on the substrate orientation. The results indicate that the immiscible region of the epitaxial layer on the (100) face is wider than that on the (111)B face. (16 refs.)

114390 Role of electronic processes in epitaxial recrystallization of amorphous semiconductors. J.S.Williams (Microelectronics Technol. Centre, Royal Melbourne Inst. of Technol., Melbourne, Australia), R.G.Elliman. *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1069-72 (19 Sept. 1983).

A phenomenological model of the solid-phase epitaxial growth process is proposed to account for the influence of substrate orientation and doping on growth kinetics. The model combines structural features of the amorphous-crystalline interface with electronic processes related to changes in the Fermi level. The basic premise is that the concentration of kinklike growth sites at the interface, and hence the growth velocity, can be influenced by doping in a manner analogous to the enhancement of dislocation velocities by doping. (18 refs.)

114391 On a relationship between substrate perfection and stacking faults in homoepitaxial silicon. A.Dreeben, A.Schujko (RCA Labs., Princeton, NJ, USA).

RCA Rev. (USA), vol.44, no.2, p.217-30 (June 1983).

Imperfections and defects in silicon substrates used for homoepitaxial devices can be sources for the nucleation of stacking faults at the epi layer-substrate interface. These faults can be electrically active and degrade device performance. In addition to dislocations and impurity atoms, damaged layers on the substrate are also possible sources. Such damage can arise from the mechanical polishing processes for preparing the substrate and from ion implantation. An evaluation of residual substrate damage resulting from ion implantation and its effect on epitaxial layers has been made. Chemical etching has been used to reveal the damage in patterned device wafers prior to vapour phase epitaxy. Using Nomarski microscopy, the authors have compared these samples with similarly etched epitaxial layers on companion wafers. Stacking faults in the epilayers have been correlated with etch pit formation in the buried layer pockets. The results show that residual damage and stacking fault formation are related. (17 refs.)

114392 EELS and AES study of epitaxially grown Pd(111) thin films. V.D.Vankar, R.W.Vook (Dept. of Chem. Engng. & Materials Sci., Syracuse Univ., Syracuse, NY, USA).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.463-74 (Sept. 1983).

Electron energy loss spectroscopy and Auger electron spectroscopy have been used to study epitaxially grown Pd(111) thin films on mica. Four loss lines at 7, 18, 24 and 33 eV have been observed and are interpreted as due to combinations of surface and bulk plasmon excitations. The effect of trace amounts of surface impurities, as detected by AES, was correlated with ELS spectra. The plasmon loss line at 7 eV was found to decrease in intensity in varying amounts due to the presence of surface impurities. The other lines, being in rich in bulk character, were not affected significantly. (21 refs.)

114393 UHV-SEM study of the nucleation and growth of Ag/W(110). G.D.T.Spiller, P.Akhter, J.A.Venables (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.517-33 (Sept. 1983).

The nucleation and growth of Ag on W(110) single crystals has been studied by ultra-high vacuum SEM, AES and electron backscattering techniques. The system is confirmed to grow in the Stranski-Krastanov growth mode with 2 stable monolayers (ML) in the intermediate layer. Island density measurements are reported in the temperature range $473 < T < 823$ K at a deposition rate $R = 0.3 \text{ ML min}^{-1}$, and at $T = 573$ and 773 K for $0.03 < R < 0.8 \text{ ML min}^{-1}$. These results are interpreted in terms of nucleation theory. They are consistent with critical nucleus sizes in the range 7-10 atoms, and binding energies of small, two-dimensional Ag clusters which are less than expected on the simplest pair-bonding arguments. More qualitative observations on defect-induced nucleation and the shape of the growing islands are also reported. (24 refs.)

114394 Process of formation of porous silicon and autoepitaxy on its surface. V.A.Labunov, V.P.Bondarenko, L.K.Glinenko, I.N.Basmanov (Minsk Radiotech. Inst., Minsk, Belorussian SSR).

Sov. Microelectron. (USA), vol.12, no.1, p.8-13 (Jan.-Feb. 1983). Translation of: *Mikroelektronika (USSR)*, vol.12, no.1, p.11-16 (Jan.-Feb. 1983). [received: Sept. 1983]

During anodic electrochemical treatments in electrolytes based on hydrofluoric acid it is possible to form a layer of porous silicon (PS) at the surface of single-crystal silicon. A distinguishing feature of PS is that it can preserve the crystalline structure of the initial material. The authors established the presence of a stable correlation between the anodization conditions, the density of the PS, and the structure of its surface. It has been shown that the structure of an epitaxial film on porous silicon is determined by its density. With a density $\approx 1.90 \text{ g/cm}^3$ the hydride method forms single-crystal epitaxial films on porous silicon with a defect density less than $10^5 \text{ defects/cm}^2$; with density $\leq 1.5 \text{ g/cm}^3$ an amorphous phase is seen in the structure of the epitaxial film. The authors have found the anodization regime for $\text{N}^+ \text{Si}$ which will provide growth of high-quality single-crystal epitaxial films on the porous silicon produced. (4 refs.)

114395 Process study of chemically vapour-deposited SnO_x ($x \approx 2$) films. J.C.Lou, M.S.Lin, J.I.Chi, J.H.Shieh (Dept. of Electrical Engng., Nat. Tsing Hua Univ., Hsinchu, Taiwan).

Thin Solid Films (Switzerland), vol.106, no.3, p.163-73 (19 Aug. 1983).

The physical characteristics of SnO_x ($x \approx 2$) films deposited onto Pyrex glass substrates by chemical vapour deposition are studied. The temperature dependence indicates that films deposited at 600°C have good polycrystallinity. The electrical conductivity of the 600°C films is mainly controlled by the variation in the SnCl_4 vapour flow rate. A subsequent thermal annealing process can even reduce the sheet resistance to $400 \Omega/\square$. In addition, the visible absorption shows that the 600°C films tend to lose their transparency in the short wavelength range of the visible spectrum. (14 refs.)

114396 Phase formation and kinetics of the phase transition in Ag_2Se thin films. A.G.Abdullayev, R.B.Shafizade, E.S.Krupnikov, K.V.Kiriluk (Inst. of Phys. of the Acad. of Sci., Baku, Azerbaijan SSR).

Thin Solid Films (Switzerland), vol.106, no.3, p.175-84 (19 Aug. 1983).

The results of an investigation of phase formation and the kinetics of the phase transition in Ag_2Se thin films by kinematic electron diffraction are reported. Information on the phase transition $\text{Ag}_2\text{Se}(\text{orthorhombic}) \rightarrow \text{Ag}_2\text{Se}(\text{tetragonal})$ was obtained from measurements of the ion current. The band gap, the Fermi level and the effective mass of the carriers for both the orthorhombic and the tetragonal phase of Ag_2Se were obtained from tunnel spectroscopy. (33 refs.)

114397 Properties and structure of carbon excess $\text{Ti}_x\text{C}_{1-x}$ deposited onto molybdenum by magnetron sputtering. T.Shikama, H.Araki, M.Fujitsuka, M.Fukutomi, H.Shinno, M.Okada (Nat. Res. Inst. for Metals, Tsukuba Labs., Ibaraki, Japan).

Thin Solid Films (Switzerland), vol.106, no.3, p.185-94 (19 Aug. 1983).

There has been little concern about the properties and structure of the carbon excess $\text{Ti}_x\text{C}_{1-x}$ ($x < 0.5$) deposits, although many investigations have been conducted on the single-phase $\text{Ti}_x\text{C}_{1-x}$ ($x > 0.5$) deposits. It is found that carbon excess $\text{Ti}_x\text{C}_{1-x}$ deposits prepared by magnetron sputter coating have a higher microhardness than the stoichiometric deposits and show a strongly (111)-preferred orientation. The results of C K α X-ray spectroscopy of these films strongly suggest that carbon excess $\text{Ti}_x\text{C}_{1-x}$ exists as a single phase of titanium carbide without the formation of a secondary graphite phase. The abnormal diffusion of substrate molybdenum atoms into the carbon excess $\text{Ti}_x\text{C}_{1-x}$ deposits suggests that they contain a high population of the titanium vacancies. (21 refs.)

114398 Epitaxy by pulsed annealing of ion-implanted silicon. G.Foti, E.Rimini (Istituto di Struttura della Materia, Univ. di Catania, Catania, Italy).

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.203-45. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

The authors consider in some detail the experiments performed on ion-implanted silicon samples irradiated with a laser or electron beam single pulse. Structural changes from amorphous to crystalline material are reviewed and described in terms of a liquid transient formation. The energy of the incident beam is absorbed by the matrix and subsequently converted to heat. The surface layer of the irradiated material can be melted, and a defect-free crystalline layer results from liquid epitaxial growth on a single-crystal substrate. Residual defects resulting from irradiation are also described. The melting of amorphous material should require less energy than that required to melt the corresponding amount of crystalline material. In addition the melting of the amorphous layer should occur at a temperature lower than that of a crystalline layer. These phenomena can give rise, under suitable experimental conditions, to regions of considerable undercooling. (69 refs.)

114399 Epitaxy of deposited Si. J.M.Poate, J.C.Bean (Bell Labs., Murray Hill, NJ, USA).

In book: *Laser annealing of semiconductors*, J.M.Poate, J.W.Mayer [Ed.], p.247-80. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

Laser processing of deposited layers has been intensively investigated over the past few years. In most experiments, laser epitaxy begins with a CVD- or MBE-like deposition done at so low a temperature that amorphous or polycrystalline growth occurs. The low temperature eliminates diffusion, and one can either exploit the thick, rapid, low-cost deposition of CVD or the good control of MBE. The role of the laser is then to produce the one factor that has been sacrificed, crystallinity. The laser accomplishes this by heating the deposited layer to a temperature where it will crystallize either by solid phase epitaxial growth or by melting and crystalline resolidification. The authors show that the spatial and temporal localization of the laser irradiation permits crystallization with little or no disturbance of the underlying structure. This has the obvious potential advantage of permitting epitaxy over processed semiconductor structures. The most active and exciting area of laser epitaxy at present is not the conventional vertical epitaxy but rather lateral epitaxy over amorphous and insulating substrates. The ability to controllably melt and recrystallize Si on SiO_2 , Si_3N_4 , and fused quartz has opened new dimensions of epitaxy and devices. This field is progressing extremely rapidly, and the authors summarize the methods by which nucleation and growth are controlled. (81 refs.)

114400 Formation of titanium silicide at atmospheric pressure. P.Revesz, J.Gyimesi, J.Gyulai (Central Res. Inst. for Phys., Budapest, Hungary).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.417-21.

Two problems connected with the growth of Ti-silicide have been investigated. It is shown if a silicon dioxide step on a single crystal of silicon covered with titanium is annealed then, following vertical growth on the silicon part, lateral growth of Ti-silicide takes place over the oxide layer. The authors also studied the problems of Ti-silicide growth on samples implanted with high doses of Sb, As, P, Ar and O prior to Ti evaporation. (7 refs.)

114401 The effect of oxygen in cosputtered (titanium+silicon) films. R.Beyers, R.Sinclair (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA), M.E.Thomas.

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.423-7.

The effect of oxygen incorporation on the growth and microstructure of TiSi₂ has been investigated. Cosputtered films, with Si/Ti ratios between one and three, were deposited on (100) Si substrates and reacted at temperatures from 650° to 1050°C . Both Auger electron spectroscopy, in conjunction with sputter profiling, and Rutherford backscattering spectrometry indicate that oxygen in the as-deposited films redistributes to the silicide-silicon interface upon heating. Cross sectional transmission electron microscope images show that the oxygen is present as an amorphous oxide. (4 refs.)

114402 Simulation of CVD-processes. G.Wahl (Brown Boveri & Cie AG, Res. Center, Heidelberg, Germany).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.19-29.

CVD-processes are determined by gas flow phenomena: by convection, by diffusion, and by chemical reactions in the gas phase and/or on the surface. A computer program is described which calculated the gas flow and which takes into account both homogeneous and heterogeneous reactions. The program is applied to a deposition process. $A + B \rightarrow C + D$, whereby this reaction can occur in the surface or in the gas phase. In both cases the molecule C is deposited. The mass fractions of A, B, C and D are assumed to be small in comparison to the inert diluent gas. The influence of the deposition parameters on the deposition profile on the deposition surface is discussed. It is demonstrated under which deposition conditions a surface layer with constant thickness can be produced. (8 refs.)

114403 Potentials of X-ray diffraction and electron microscopy for the characterization of thin polycrystalline CVD layers. R.Delhez, M.Hendriks, T.H.de Keijser, S.Radelaar (Lab. of Metall., Delft, Netherlands).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.30-5.

Although polycrystalline layers produced by chemical vapour deposition (CVD) have found widespread application, comparatively little work has been done on the characterization of the structure and morphology of these layers by X-ray diffraction and transmission electron microscopy. The authors give a brief survey of the kind of information that can be obtained by these techniques. The emphasis is on X-ray diffraction since this technique is nondestructive and averages over an area of $\sim 1 \text{ cm}^2$ and provides information which cannot easily (or as in the case of internal stresses) be obtained by electron microscopy. Information that can be obtained from X-ray diffraction concerns composition, preferred orientation (texture), long-range mechanical stresses, crystallite size and microstrain (due to short-range stresses). As examples the authors present results obtained on polycrystalline silicon layers. (11 refs.)

114404 Theoretical influence of the deposition conditions on the uniformity of boron carbide coatings. L.Vandenbulcke (Univ. of Orleans, Orleans, France).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.44-50.

Calculations are presented for the CVD deposition of boron carbide from $\text{BCl}_3\text{-CH}_4\text{-H}_2$ where the process determines in addition the composition uni-

formity. The theoretical treatment is based on a model coupling surface kinetics and diffusion through the boundary layer. It is applied to a deposition system where the direction of gas flow is parallel to a flat surface. This simple system exhibits the double influence of the depletion of the reactants and the variation of the boundary layer thickness along the surface. The results can be qualitatively extended to other geometries where these problems are encountered such as deposition inside tubes, and also the deposition on complex-shaped substrates or in a large-scale deposition chamber. (7 refs.)

114405 Atom-probe microanalysis and field-ion microscopy of TiC-coatings on cemented carbides. A.Henjered, H.Norden, L.Kjellsson, J.Skogsmo (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden). Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.91-6

One way to improve the wear resistance of cemented carbides is to coat them with a 5-10 μm thick layer of titanium carbide, using CVD. In spite of the importance of the coated cutting tools very little is known about the nucleation and growth of the coating. Methods to coat needle-formed specimens of WC-Co-type cemented carbides with TiC were previously developed (Henjered et al. 1981). Such specimens were studied with both transmission electron microscopy (TEM) and atom-probe field-ion microscopy. A combination of these two techniques offers a possibility to determine the structure and the elemental composition of the titanium carbide layer as well as the composition of the coating substrate interfacial region. (4 refs.)

114406 Modeling of GaAs growth in the MOCVD system. N.Putz, J.Korec, M.Heyen, P.Balk (Inst. of Semiconductor Electronics, Tech. Univ. Aachen, Aachen, Germany).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.103-9

Presents a first attempt to give a simple but comprehensive description of MOCVD growth of GaAs. As is always the case in growth experiments, the data are to some extent determined by the geometry of the apparatus and by the shapes of the steep temperature gradient in the cold wall reactor, which complicates the analysis. The present study is based on a set of data for MOCVD growth of GaAs in the pressure range 10^4Pa and temperatures between 743 and 1023K. Growth was only obtained for $p(\text{AsH}_3) > p_{\text{TMG}}$. Since the precise course of the deposition reaction is not known the authors consider two simple possibilities: (a) breakdown of TMG and AsH_3 in the gas phase followed by adsorption of some of the reaction products (including Ga and As) at the surface and (b) formation of TMG- AsH_3 complexes in the gas phase with subsequent adsorption and breakdown of the complex to form GaAs. (5 refs.)

114407 CVD-deposition of aluminium on nickel-based alloys from AlCl_3/H_2 -gas-mixtures. A.Reich, L.Singheiser, G.Wahl (Brown, Boveri & Cie AG, Res. Centre, Heidelberg, Germany).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.122-9

The oxidation behaviour of nickel-based alloys at high temperature can be raised by using Al-enriched layers on these alloys. Deposition of Al on nickel-based alloys results in the formation of Ni-Al intermetallic compounds, depending on the Al-activity during the deposition process. Deposition of Al on nickel and nickel-based alloys is possible by CVD from AlCl_3/H_2 -gas mixture in contact with pure aluminium. Deposition of Al results in the formation of NiAl-layers on nickel and the nickel-based alloys investigated. The growth-rate of the NiAl-layer is followed by a parabolic rate law with rate limiting diffusion processes occurring in the alloy. The parabolic rate constant linearly decreases with increasing content of alloying additions. (6 refs.)

114408 Chemical vapour deposition of boron on silicon. M.Boman, J.-O.Carlsson (Dept. of Chem., Univ. of Uppsala, Uppsala, Sweden).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.134-40

The chemical reactions occurring during the initial stages of growth in a CVD process, i.e. as long as the substrate is present in the reaction gas mixture, are mostly quite different from those taking place later, when a completely intact coating has been grown. These initial reactions may influence the adherence of the coating as well as the grain size of the coating near the coating/substrate interface. The results are summarized of a study of the initial interfacial reactions occurring during CVD of amorphous boron on a silicon substrate from a reaction gas mixture containing boron trichloride and hydrogen. (7 refs.)

114409 Modeling of doping during CVD growth of semiconductor films. J.Korec, M.Heyen (Inst. of Semiconductor Electronics, Tech. Univ. Aachen, Aachen, Germany).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.176-83

Modeling of the epitaxial deposition of undoped semiconductor material has been discussed in detail in an earlier study (see J. Cryst. Growth, vol.60, p.286, 1982). This paper shows a possibility to complete the above model to include intentional doping. The molar fraction of dopant atoms in the deposited material is given by the ratio of the flux of the incorporated dopant and the condensation flux of the host material. These fluxes are calculated from a dynamic balance of the rates of the mass transport in the gas phase and of the following sequence of surface processes: adsorption, chemical reaction, surface diffusion and binding to the substrate. The deposited film is described in terms of a regular solution model. The possibility of redistribution of dopant atoms between the interface and the volume of the semiconductor is also taken into consideration. The author's model is valid for the CVD of elemental and compound semiconductors. The applicability of the model is demonstrated for the case of sulfur doped GaAs films, which is considered as a regular solution $\text{GaAs}_{1-x}\text{S}_x$. It is shown that the experimentally observed dependences of the sulfur concentration in the film on the H_2S , GaCl and hydrogen pressures are reproduced in the authors' calculations. (15 refs.)

114410 The incorporation of dopants during growth of GaAs by CVD. L.J.Giling, H.H.C.de Moor (Dept. of Solid State III, Catholic Univ., Nijmegen, Netherlands).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.184-93

The slope which is observed in the log-log plot of incorporated dopant versus the partial pressure of the dopant gas is explained by assuming that the growth rate is faster than the exchange rate of dopant atoms between bulk and surface. This trapping mechanism is shown to be valid for the incorporation of S in GaAs and Te in GaP for growth rates larger than $10\text{ }\mu\text{m/h}$. For the doping of GaAs with S at growth rates of $5\text{ }\mu\text{m/h}$ or smaller theoretically

an S-shaped curve is predicted. All curves saturate at a level of $3 \times 10^{18}\text{ cm}^{-3}$. (12 refs.)

114411 CVD a-Ge and a-Ge:X films: preparation and properties. D.D.Allred, J.A.Pionkowski (Energy Conversion Devices, Troy, MI, USA).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.197

Summary form only given. Germanium films were deposited by the low pressure (approximately 20-55 Torr) pyrolytic decomposition of germane on substrates held at various temperatures, Ts, in the range of 635 to 700K. Optical properties: absorption coefficient and the refractive index; electronic properties: conductivity and activation energy, and the X-ray diffraction pattern on these films were determined. The films deposited at or below approximately 660K are amorphous with an optical gap of 1.0 eV. This is the first report of the preparation of a-Ge via CVD. The absorption profile of the films resembles that reported for sputtered or evaporated films deposited at elevated temperatures or exposed to a long-term anneal. Amorphous Ge:X (X=B, C, etc.) alloys have also been prepared and characterized. These materials may find utility in solar spectrally selective absorbers. The authors' results show that the superior absorbance of amorphous germanium may be employed in producing selective surfaces with the advantage of CVD fabrication. (no refs.)

114412 The mechanism of the growth of InP by MOCVD. J.Haigh, S.O'Brien (British Telecom Res. Labs., Ipswich, England).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.198

Summary form only given. The authors present two spectroscopic investigations of the pyrolytic decomposition of group III metallo-organics relevant to the MOCVD process. Firstly, using atomic absorption spectrometry they show that the pyrolysis of GaEt_3 and InMe_3 do not generate measurable quantities of gallium and indium atoms in the vapour phase, under MOCVD conditions. This implies that the MOCVD process goes via surface-adsorbed species containing metal-carbon bonds. Secondly, using ultra-violet spectroscopy to monitor the metallo-organic content of a vapour stream passing over InP, GaAs and glass surfaces, as a function of the temperature of the stream, the authors show that there is no appreciable acceleration of the decomposition of the metallo-organic by the semiconductor surface, as opposed to the glass. This implies that heterogeneous decomposition reactions of the type described previously do not show surface specificity. (3 refs.)

114413 Characterization of thin plasma silicon-nitride layers. W.A.P.Claassen, W.G.J.N.Valkenburg, A.E.T.Kuiper, Y.Tamminga (Philips Res. Labs., Eindhoven, Netherlands).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.199-205

The composition is studied of silicon-nitride layers, grown by plasma CVD from $\text{SiH}_4\text{-NH}_3\text{-N}_2$ mixtures at temperatures of about 300°C and an operating frequency of 50 kHz. The layers as deposited on silicon substrates, were characterized with Auger electron spectroscopy (AES) and Rutherford back-scattering spectroscopy (RBS). AES in-depth profiles and RBS measurements at glancing angles reveal that oxygen is present at the interface between silicon and silicon nitride and at the surface. It is demonstrated that the interfacial oxygen can be removed by in-situ plasma etching with SF_6 or NF_3 , prior to deposition. However, a sulphur pile-up is found in the case of an SF_6 etch. With both etchants some fluorine is also detected in the nitride layer, especially when SF_6 is used. (7 refs.)

114414 Electrical versus structural properties of polycrystalline silicon deposited by plasma enhanced LPCVD below 550°C . N.Ababou, C.Chaussat, A.Deneuville (Groupe des Transitions de Phases, CNRS, Grenoble, France), L.Brunel, M.Toulemonde.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.206-10

As the channel lengths of MOS transistors decreases, 'cold' technologies are sought to avoid impurities or doping atoms diffusion in the Si under the gate during the various processes. Moreover, for three dimensional microelectronic thin films the goal is to attain a deposition temperature T_D below 550°C on glass. Besides classical LPCVD which needs $T_D > 630^\circ\text{C}$ to get poly Si, such films can be obtained at lower temperature by chemical transport by a hydrogen plasma or glow discharge decomposition of SiH_4 . The authors delineate an easier preparation range to obtain poly Si, at low T_D , whose physicochemical as well as electrical properties are described. (14 refs.)

114415 Indirect and direct formation of polycrystalline silicon during CVD. A.M.Beers, J.Bloem (RIM Dept. of Solid State Chem., Univ. of Nijmegen, Nijmegen, Netherlands).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.211-16

Amorphous growth and subsequent crystallization in the grown layer is investigated and compared with crystalline growth from the gas phase. Based on time-resolved optical reflectivity measurements, a non-destructive in situ method is developed for the determination of the crystallization rate in addition to the growth rate of amorphous silicon during CVD. The results of optical measurements are related to the crystallization process and the resulting film structure. Good correspondence is found for the crystallization rates of CVD a-Si as compared to the (111) crystallization rates of a-Si prepared by other methods. (7 refs.)

114416 Properties of thin polycrystalline silicon films deposited by plasma-assisted CVD. W.R.Burger, T.J.Donahue, R.Reif (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.265-72

The electrical and structural properties of thin polysilicon films deposited by plasma-assisted CVD (PACVD) are being investigated and compared to those of films deposited without plasma by low-pressure CVD (LPCVD). The intrinsic resistivity of the PACVD films was found to be lower than the LPCVD films deposited under the same conditions over the temperature range examined, with the difference becoming greater the lower the deposition temperature. The X-ray texture of the films was also examined. The PACVD films exhibited a texture versus deposition temperature trend similar to the LPCVD films, though a given structure tended to appear at a lower temperature in the PACVD films. Upon annealing, the intrinsic resistivity of the LPCVD films decreased from their as-deposited values, while the intrinsic resistivity of the PACVD films increased upon annealing. The texture of both the PACVD films and the LPCVD films remained unaffected by the anneal; however, the lowest deposition temperature PACVD film showed a substantial enhancement in the perfection of the alignment of the grains upon annealing. (4 refs.)

114417 Adsorption phenomena in CVD systems. L.J.Giling, A.A.Saaman (Dept. of Solid State III, Faculty of Sci., Catholic Univ., Nijmegen, Netherlands).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.280-2
Calculations have made it clear that as long as accurate numerical data for the adsorption process are unknown, no reliable opinion can be expressed whether a surface is fully covered with adsorbed species or not. This means that—contrary to earlier calculations—during the CVD of silicon and gallium arsenide at the high temperature side, the surface may be clean and adsorption is only of minor importance. Only at lower temperatures will adsorption indeed become important for what may be responsible for hillock formation and finally polycrystalline growth. (no refs.)

114418 Al₂O₃ deposition by CVD. B.Lux (Tech. Univ. Wien, Vienna, Austria).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.379-84
About one decade ago a major breakthrough in the development of chip forming steel cutting tools was brought about by the coating of cemented carbides with Al₂O₃ layers. Compared with the various other layers (TiC, TiN, HfN, etc.) known before the introduction of Al₂O₃ for this purpose, the Al₂O₃ coating gives the most outstanding results and can be found today—frequently in combination with other layers—in many industrial products. The reasons for the spectacular increase in the wear resistance of a cutting tool with a CVD coating are manifold. Today the industrial production of Al₂O₃ layers by CVD is done worldwide and has a yearly business volume exceeding several 100 millions of dollars and there are today in the open literature still more patent applications available than scientific and technical publications. The author discusses further the applications of CVD deposited Al₂O₃ layers. (13 refs.)

114419 The effect of reaction condition on the crystallographic orientation and surface morphology of chemical vapor deposited Al₂O₃. C.Park, J.Kim, J.S.Chun (Dept. of Materials Sci. & Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.410-20
Deposits of aluminium oxides (Al₂O₃) have been formed by a chemical vapor deposition technique involving the application of gaseous mixtures of AlCl₃, CO₂, and H₂ onto TiN-coated cemented carbide substrates. Reaction parameters (deposition temperature, system pressure, and composition of reactant gases) and their effects on the crystalline structure, crystallographic orientation, and surface morphology of the Al₂O₃ deposit have been studied. Al₂O₃ crystals maintain a corundum structure throughout the entire range of deposition conditions. Crystals of Al₂O₃ appear to nucleate in random orientations on the TiN layer, and further growth proceeds with (1014) and (1126) preferred orientations. The effects of reaction parameters on the final surface morphology of the Al₂O₃ deposit can be described by considering the supersaturations of the reactants and the growth rate. The crystals of the Al₂O₃ deposit become finer and more uniform as the supersaturation of the reactant controlling the Al₂O₃ nucleation increases. (10 refs.)

114420 Growth of α -Al₂O₃ on single- and polycrystalline alumina substrates by CVD. H.Altena, C.Colombier, B.Lux (Tech. Univ. Wien, Vienna, Austria).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.435-43
The crystal orientation of Al₂O₃ substrates has a definite influence on the growth rate of the Al₂O₃-layer during CVD growth. Epitaxial growth generally takes place on highly polished polycrystalline surfaces, while on unpolished, rough surfaces nucleation occurred which led to non-epitaxial relationships. Nucleation and growth of epitaxially linked individual crystals were observed on single crystalline substrates, too. In this case, a coin-shaped crystal habitus grew on locations where presumably lattice defects existed in the single crystalline substrate. (15 refs.)

114421 Influence of trace impurities on the formation of α -Al₂O₃ layers by CVD. H.Altena, C.Colombier, B.Lux (Tech. Univ. Wien, Vienna, Austria).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.451-8
During the industrial CVD process, the presence of trace impurities can disturb the formation of Al₂O₃ coatings on cemented carbides. Such impurities could originate from the raw materials by reaction on the construction materials (Cr, Ni, Fe) with the gases used or could diffuse from the substrate (Co, Ti) to the solid/gas interface. The action of Cr, Ni, Fe, Ti and Au on Al₂O₃ CVD deposits is discussed. (13 refs.)

114422 Effect of TiCl₄ addition on the structure of chemically vapor-deposited Si₃N₄. T.Hirai, S.Hayashi, A.Tanaka (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.503-8
The increase in TiCl₄ flow rate caused a variation in the structure of Si₃N₄ matrix in the Si₃N₄-TiN composite from amorphous to α - and β -phases. The abrupt increase in the β -Si₃N₄ content was observed in a narrow flow rate range at T_{dep} of 1350 and 1450°C. The density of the crystalline Si₃N₄ matrix was close to the theoretical density, while the composites including the amorphous Si₃N₄ exhibited a lower density than the theoretical density. The surface morphology of the composites reflected well the structures of CVD-Si₃N₄. (4 refs.)

68.60 PHYSICAL PROPERTIES OF THIN FILMS, NONELECTRONIC

- 114423 Plasmastructural transformations in amorphous chalcogenide semiconductors. P.N.Dashuk, V.M.Lyubin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.583-4 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1357-61 (Nov. 1982). [received: Sept. 1983]
- Reports a study of the effect of the plasma of an electric discharge on amorphous chalcogenide semiconductors. Changes occur in several properties of the semiconductors. The experiments were carried out with amorphous chalcogenide semiconductor films of the As-Se and As-S systems, in particular with As_2Se_3 , AsSe, As_3Se_2 , and As_2S_3 films, in which the photostructural transformations are most obvious. The films were synthesized by vacuum deposition on a 2-mm oxide glass substrate. (5 refs.)
- 114424 The mode of detachment of HfN coatings. A.J.Perry, B.Hammer, M.Groessl (Balzers AG, Balzers, Liechtenstein). Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.70-5
- Hafnium nitride coatings deposited on to cemented carbides by chemical vapour deposition have been subjected to the scratch test for adhesion. The critical loads recorded (5-12 kg) are the highest so far observed for any system. Many of the samples showed a mode of loss which had not been observed before: a wave-like pattern where cracking appears to be confined to the scratch channel and to run parallel to the interface. Some preliminary studies of the acoustic signal in the range centered around 200 kHz are reported. (7 refs.)

68.70 WHISKERS AND DENDRITES: GROWTH, STRUCTURE, AND NONELECTRONIC PROPERTIES

- 114426 A TEM study of fibrous cuprite (chalcotrichite): microstructures and growth mechanisms. D.R.Veblen (Dept. of Earth & Planetary Sci., Johns Hopkins Univ., Baltimore, MD, USA), J.E.Post. *Am. Mineral. (USA)*, vol.68, no.7-8, p.790-803 (July-Aug. 1983).
- A specimen of the fibrous, or whisker variety of cuprite ('chalcotrichite') was examined with transmission electron microscopy (TEM). Of several morphologically distinct whisker types, only those with square cross sections were observed to contain screw dislocations. The dislocations generally are straight and close to the whisker axis, although in some cases the dislocations approach the crystal surface, and in one case a helical dislocation was observed. In addition, one whisker with a very large Burgers vector contained a hollow axial tube in accordance with Frank's (1951) theory. The presence of axial screw dislocations in almost all of the chalcotrichite whiskers of square cross section indicates that they formed by a spiral growth mechanism, thus accounting for their extreme elongation. The growth mechanisms of the chalcotrichite ribbons cannot be determined from the available observations,

but it is likely that several complex mechanisms operated, since there are a variety of different whisker types present. This variety also suggests that it is the growth conditions (temperature, pressure, vapor composition, degree of supersaturation) that determine whether whiskers or equidimensional crystals will grow, rather than the specific mechanisms of whisker growth. (58 refs.)

- 114427 The formation of filamentous carbon from decomposition of acetylene over vanadium and molybdenum. R.T.K.Baker, J.J.Chludzinski, N.S.Dudash, A.J.Simoens (Exxon Res. & Engng. Co., Linden, NJ, USA). *Carbon (GB)*, vol.21, no.5, p.463-8 (1983).
- Controlled atmosphere electron microscopy has been used to investigate the deposition of carbon on vanadium and molybdenum surfaces during the thermal decomposition of acetylene. Both metals were found to be active catalysts for carbon filament formation, whereas the carbides, VC and Mo_2C were found to be inactive. The filament growth kinetics indicates that these structures are produced via the same mechanism as that proposed for the production of filaments from the interaction of hydrocarbons with Fe, Ni and Co. It was also shown that the strength of the metal-support interaction can have a profound effect on the mode by which carbon filaments grow. (14 refs.)
- 114428 Formation of whiskers on Al_2O_3 CVD layers. H.Altena, C.Colombier, A.Lebbl, J.Lindstrom, B.Lux (Tech. Univ. Wien, Vienna, Austria). Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.428-34
- So-called A- and C-whiskers of $\alpha\text{-Al}_2\text{O}_3$, which differ in their main growth direction, are described in the literature. C-type whiskers are quite frequently observed during the coating of cemented carbides with Al_2O_3 by CVD. Small impurities of Co and Si can lead to the whisker formation by a VLS (vapor-liquid-solid) mechanism. A cobalt silicide acts as the liquid phase. The VLS mechanism is, however, not the only possibility for whisker formation. (13 refs.)

71.10 GENERAL THEORIES AND COMPUTATIONAL TECHNIQUES

- 114429 Spin excitations in a Hubbard chain. F.Woynarovich (Central Res. Inst. for Phys., Budapest, Hungary). *J. Phys. C (GB)*, vol.16, no.27, p.5293-304 (30 Sept. 1983).
- The spin excitations of a Hubbard chain are calculated on the basis of the Lieb-Wu equations (1968). A system of equations, which contains the parameters of the excitation only, is derived. It is found that both the energy and the momentum of the spin excitations depend only on the positions of the holes in the real γ distribution. The energy-momentum dispersion for a half-filled band is given. The structure and degeneracy of the lowest energy excitations are also discussed. (8 refs.)

71.20 ELECTRONIC DENSITY OF STATES DETERMINATIONS

(inc. energy states of liquid semiconductors; see also 65.40 Lattice and electronic heat capacity)

- 114430 Analytic-quadratic method of calculating the density of states. M.S.Methfessel, M.H.Boon, F.M.Mueller (Res. Inst. for Materials, Nijmegen, Netherlands). *J. Phys. C (GB)*, vol.16, no.27, p.1949-54 (30 Sept. 1983).
- A new analytic method of calculating the density of states based on local quadratic expansions is given. Results are presented for the tight binding s band and for the valence bands of silicon. These show that the new technique properly treats van Hove singularities, where the commonly applied method using local linear expansions fails. (5 refs.)
- 114431 Density-of-state effects in the low temperature properties of TiBe_2 . T.Jarlborg (Dept. de Phys. de la Matière Condensée, Univ. de Genève, Genève, Switzerland), P.Monod, M.Peter. *Solid State Commun. (USA)*, vol.47, no.11, p.889-93 (Sept. 1983).
- The importance of exact theoretical and experimental determination of the band structure near E_F for an understanding of the properties of TiBe_2 is pointed out. Precise density-of-state data, obtained from ab initio self-consistent band calculations, are used to determine low temperature variations in the susceptibility χ and specified heat γ . The influence on the field and temperature variations on χ is striking and qualitative agreement with experiment is possible without invoking spin-fluctuations. The field and temperature variations of γ are important enough to be considered, but are smaller than for χ and considerably smaller than observed experimentally by Stewart et al. (1982). Thus evidence of spin-fluctuations are more convincing when extracted from γ -data than from χ -data. (20 refs.)

71.25 NONLOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

114432 The controllable variband structures in a ferroelectric semiconductor. V.B.Sandomirskii, Sh.S.Khalilov, E.V.Chensky (Azerbaijan State Univ., Baku, USSR). *Ferroelectr. Lett. Sect. (GB)*, vol.1, no.1, p.7-12 (1983). The possibility of formation of the variband structure in a ferroelectric semiconductor is pointed out. The energy scheme of such variband structure depends on temperature, electric bias, light intensity and possesses hysteresis. (6 refs.)

114433 Surface and bulk electronic structure of disordered metallic alloys. A.Bansil (Dept. of Phys., Northeastern Univ., Boston, MA, USA), M.Pessa. *Phys. Scr. (Sweden)*, vol.T4, p.52-60 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982). The understanding of electronic structure of disordered alloys has advanced rapidly during the last decade, and the basic elements of a band theory of the bulk electronic structure of random alloys have emerged clearly during this period. In providing an overview of this theory, the authors focus on the question of how the concept of a Bloch energy band generalizes to the disordered case; illustrative examples of Cu-based solid solutions are presented. On the experimental side, the application of angle-resolved photoemission spectroscopy (ARPES) to the alloy problem is discussed. The use of ARPES in this context is quite recent, although extensive studies of alloys, using a variety of solid state techniques, have been carried out. The existing ARPES work aimed at delineating the surface and bulk electronic structure in metallic alloys is reviewed. The authors also allude to some of the relevant theoretical and experimental issues that arise in connection with developing this application of the ARPES. (69 refs.)

114434 Band theory of some polymers derived from polyparaphenylene. M.Dugay, C.Fabre (Lab. d'Electronique et Resonance Magnetique, Univ. de Clermont II, Aubiere, France). *Solid State Commun. (USA)*, vol.47, no.12, p.965-8 (Sept. 1983). Reports the results of calculations dealing with a series of polymers related to polyparaphenylene. In order to investigate the possible effects of linking aromatic rings with segments having conjugated bonds and/or heteroatoms, semi-empirical calculations have been performed from a Pariser-Parr-Pople Hamiltonian. It is shown that, within this simple methodology, reliable information can be obtained concerning the ability of a polymer to form a conducting system upon doping. (28 refs.)

Electron phase transitions in highly anisotropic two-dimensional systems See Entry 114460

71.25C Techniques of band-structure calculation (general theory, applications of group theory, analytic continuation, etc)

114435 Ab initio mixed basis method of band structure calculation: γ -Fe and cubic ZnS electronic structures. M.T.Czyzyk (Inst. of Phys., Jagellonian Univ., Krakow, Poland), F.M.Mueller. *J. Phys. C (GB)*, vol.16, no.27, p.5255-66 (30 Sept. 1983). A new approach has been developed for electronic band structure calculation. The method consists of two consecutive steps. In the first step the combined tight-binding-plane-wave (TB-PW) Hamiltonian is solved at the centre of the Brillouin zone (BZ). In the second step the k . p method is used in order to extend the solution at $k=0$ to the band structure throughout the entire BZ. The method developed has been used to calculate the band structure of FCC γ -Fe and cubic ZnS. The density of states, effective masses, the dielectric function and the reflectivity coefficient have been calculated as well. The results are compared with those obtained by other methods and with experimental data. (36 refs.)

114436 On the electronic structure of CeN and CeAl₂. W.E.Pickett, B.M.Klein (Condensed Matter Phys. Branch, Naval Res. Lab., Washington, DC, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.219-25 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). The electronic band structures of CeAl₂ are studied using the self-consistent augmented plane wave method. By artificially shifting logarithmic derivatives of the self-consistent potential, the authors are able to demonstrate that (N p)-(Ce f) hybridization is substantial in CeN. The calculated valence band densities of states are in good agreement with X-ray photoelectron spectroscopy data on CeN and UV photoelectron spectroscopy data on CeAl₂. The effects of interatomic f-f overlap interactions in these compounds (mixed valent and Kondo lattice respectively) are identified. (16 refs.)

114437 On the band structure of Mobius polymers. O.E.Polansky (Max-Planck-Inst. fur Strahlenchem., Mulheim, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.909-15 (Aug. 1983). The π -band structure of Mobius polymers (M) is compared with that of the open strip (F) and the cylindrical form (R) of the polymer considered. Under certain conditions, the bands of all these forms coincide. This is to be expected also for the σ -bands within the framework of extended Huckel theory. (13 refs.)

114438 Effect of random doping on the electronic spectrum in trans-polyacetylene. W.P.Su (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA). *Solid State Commun. (USA)*, vol.47, no.11, p.947-9 (Sept. 1983). Random dopants in trans (CH)_x introduce a broad band of gap states which merge with the conduction and valence band edges at a doping concentration n_c of a few percent. This overlap of band and gap states leads to an onset of Pauli susceptibility, since the density of states at the Fermi energy E_F is nonzero for $n > n_c$. However, E_F lies in a region of localized states until n is considerably greater than n_c and the system remains a semiconductor. (8 refs.)

71.25P Band structure of crystalline metals

114439 Electronic structure of zintl compounds (NaTi) and alkali pnictides. J.Robertson (Central Electricity Res. Labs., Leatherhead, England). *Solid State Commun. (USA)*, vol.47, no.11, p.899-902 (Sept. 1983). The presence of both like and unlike atom nearest neighbours in the NaTi lattice is used to test the dependence of tight-binding interactions on bond type. The atoms are found to be almost neutral, and little evidence of the classic Na⁺Ti⁻ bonding models is found. The bands of alkali pnictides such as Li₃Sb are calculated by scaling interactions from LiAl. The Li salts are found to have almost neutral sites whereas the Cs salts are strongly ionic. The author classifies the bonding generally as charge transfer, not covalent. (19 refs.)

114440 Electronic structure of the alloy Fe₈₀P₁₃C₇ in the liquid, crystalline, and solid amorphous states. I.N.Shabanova, S.S.Samolovich, V.A.Zhuravlev, V.T.Borisov (State Univ., Udmurt, Izhevsk, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1057-8 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.848-9 (Dec. 1982). [received: Sept. 1983] The authors report the results of an investigation of the electronic spectra of the carbon core 1S levels and the valence band (0-35 eV, as measured from the Fermi level) of the surface layers (~ 20 Å) of the amorphous alloy Fe₈₀P₁₃C₇ over a wide temperature range (from 293K to the melting temperature 1120K). The samples were made in the shape of ribbons 0.4-0.5 cm wide and 10 μ m thick by quenching the alloy from the liquid state on a rapidly rotating copper cylinder. The spectra were measured with a magnetic electron spectrometer having a resolution of 1.0 eV with the use of the Al K α line for excitation of the electrons. The samples were heated directly in the vacuum chamber of the electron spectrometer. (2 refs.)

71.25R Band structure of crystalline elemental semiconductors

114441 Mapping bulk Ge electronic energy bands along Δ using ARPES spectra of the (001) 2 \times 1 surface. J.G.Nelson, W.J.Gignac, R.S.Williams (Dept. of Chem. & Biochem., Univ. of California, Los Angeles, CA, USA), S.W.Robey, J.G.Tobin, D.A.Shirley. *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.290-8 (Sept. 1983). The E versus k dispersion relations of the second and third bulk valence bands as well as one conduction band of Ge along the Δ line of the Brillouin Zone have been experimentally determined from angle-resolved photoelectron spectra collected at the Stanford Synchrotron Radiation Laboratory. The experimentally observed bands show good agreement with those calculated using the empirical pseudopotential parameter of Chelikowsky and Cohen (1976) for bulk Ge, even though the Ge (001) surface is reconstructed and ARPES is generally considered to be a surface sensitive technique. (20 refs.)

71.25T Band structure of crystalline semiconductor compounds and insulators

114442 Electronic spectrum of a magnetic semiconductor in the s - f exchange model approximation. A.L.Kuzemsky (Lab. of Theoretical Phys., JINR, Dubna, USSR), D.I.Marvakov, J.P.Vlahov. *Bulg. J. Phys. (Bulgaria)*, vol.10, no.3, p.290-6 (1983).

The electronic spectrum of a magnetic semiconductor has been analysed in the s - f exchange model approximation using the irreducible green function method. An analytic expression of the electronic self-energy operator has been obtained and it may be used to find a self-consistent procedure in separate specific cases. The electronic spectrum of a wide-band magnetic semiconductor has been studied in detail. (16 refs.)

114443 Electronic structure and interparticle interaction in defect cubic oxides of vanadium and titanium. A.L.Ivanovskii, V.A.Gubanov, Yu.G.Zainulin, E.Z.Kurmaev, M.P.Butsman, B.I.Zborovskii (Inst. of Chem., Acad. of Sci., USSR).

J. Struct. Chem. (USA), vol.23, no.6, p.854-60 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.42-7 (Nov.-Dec. 1982). [received: Sept. 1983]

The X-ray ultrafast emission (V, Ti) L_{α} -spectra have been obtained, and cluster quantum-chemical calculations of the electronic structure carried out, for a number of nonstoichiometric oxides of V and Ti, containing a variable concentration of vacancies in the metal and nonmetal sublattices, with allowance for their possible ordering. The role of interstitial V atoms in the energetic stabilization of the ordered phase $VO_{1.3}$ has been studied. (25 refs.)

114444 Electronic structures of sulfide minerals—theory and experiment. D.J.Vaughan (Dept. of Geological Sci., Univ. of Aston, Birmingham, England), J.A.Tossell.

Phys. & Chem. Miner. (Germany), vol.9, no.6, p.253-62 (1983).

The sulfide minerals exhibit a rich diversity in structural chemistry and in electrical, magnetic and other physical properties. Models based on molecular orbital theory and incorporating some elements of band theory can be developed to describe the diverse valence electron behavior in these minerals. Qualitative models can be proposed on the basis of observed properties, and the models can be tested and refined using experimental data from X-ray emission and X-ray photoelectron spectroscopy and quantum mechanical calculations performed on cluster units which form the basic building blocks of the crystals. This approach to chemical bonding in sulfide minerals is illustrated for binary nontransition metal sulfides (ZnS, CdS, HgS, PbS), binary transition metal sulfides (FeS₂, CoS₂, NiS₂, CuS₂, ZnS₂) and more complex sulfides (CuFeS₂, Cu₂S, Ag₂S, CuS, Co₃S₄, CuCo₂S₄, Fe₃S₄). The relationship between qualitative and quantitative theories is reviewed with reference to the pyrite-marcasite-arsenopyrite-loellingite series of minerals. Application of the models to understanding structure-determining principles, relative stabilities, solid solution limits and properties such as color, reflectance and hardness are discussed. (42 refs.)

114445 Anomalous temperature dependence of the band gap of intrinsic semiconductors. N.V.Fomin (M.I. Kalinin Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.349-50 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.553-5 (March 1983). [received: Sept. 1983]

It is known that in the case of IV-VI and II-VI semiconductors the temperature coefficient of the band gap E_g is anomalous (positive). The author considers possible reasons for this anomaly. (4 refs.)

114446 On the symmetry of the electronic states in silicon carbide crystals. G.B.Dubrovskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.288-92 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.512-18 (Feb. 1983). [received: Sept. 1983]

The reflection of electrons by the various Bragg planes in SiC crystals is considered and it is shown that the principal reflecting planes in all the SiC modifications, except the 2H modification, coincide with the planes bounding the Brillouin zone of the cubic β -SiC crystal if it is assumed that the electronic states of the conduction band are formed by only the sublattice made up of the Si atoms. It is also shown that the superlattice in SiC can be described by superposing a screw axis on the cubic lattice. A primary-reflection zone is constructed in the reciprocal space of the superlattice on the basis of the Brillouin zone of β -SiC, and its symmetry is considered. (7 refs.)

71.30 METAL-INSULATOR TRANSITIONS

114447 First-principles calculation of the insulator-to-metal transition pressure in CsI. J.Aidun, M.S.T.Bukowski (Dept. of Geology & Geophys., Univ. of California, Berkeley, CA, USA).

Solid State Commun. (USA), vol.47, no.11, p.855-7 (Sept. 1983).

The room temperature compression isotherm and electronic band structure of CsI have been computed with the nonrelativistic self-consistent augmented-plane-wave method. The isotherm is in excellent agreement with available static and ultrasonic measurements, and hence allows an improved extrapolation of Asaumi and Kondo's measurements (1981) of the absorption edge to gap closure in the range 38-46 Å⁻¹ and 65-105 GPa when uncertainties in the experimental determination of the band gap are accounted for. The calculated band structure suggests that the band gap is direct and it is in close agreement with the corresponding experimentally determined band gap when the Slater exchange potential is used. These consistencies between the measurements and calculations suggest that the insulator-to-metal transition occurs in the 100±10 GPa range, somewhat higher than Asaumi and Kondo's estimate of 70 GPa, but in good agreement with the prediction from Herzfield's theory. 71.35 EXCITONS AND RELATED PHENOMENA

(inc. electron-hole drops)

114448 Detection of exciton luminescence of indium antimonide crystals. V.I.Ivanov-Omskii, S.I.Kokhanovskii, R.P.Seisyan, V.A.Smirnov, Sh.U.Yuldashev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.334-5 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.532-4 (March 1983). [received: Sept. 1983]

Kanskaya et al. (1979) reported a discovery of a discrete structure of Wannier-Mott excitons in the absorption edge spectra of InSb crystals ($n_{77} \approx 6 \times 10^{13} \text{ cm}^{-3}$) at 2K when special measures were taken to eliminate the influence of bound states. It seemed natural to investigate also the low temperature edge luminescence of the same samples in order to detect radiative recombination channels involving these bound exciton states. The experiments were carried out at temperatures 2-25K and the source of excitation was a GaAs heterojunction laser emitting at $\lambda_{\text{max}} = 0.9 \mu$. (10 refs.)

114449 Polarized luminescence due to localized excitons in CdS_{1-x}Se_x solid solutions. S.Yu.Verbin, S.A.Permogorov, A.N.Reznitskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.195-8 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.346-52 (Feb. 1983). [received: Sept. 1983]

The polarization of luminescence due to excitons localized by composition fluctuations at 2K was investigated in single crystals of CdS_{1-x}Se_x semiconducting solid solutions. The measurements were made on cleaved or growth surfaces perpendicular to the optic axis of the samples. It was found that the luminescence excited by linearly polarized radiation has a large positive degree of polarization. For excitation by circularly polarized radiation, there is not circular polarization of the luminescence. The conclusion is drawn that the observed polarization reflects the latent anisotropy of localized excitons and is due to the splitting of the doubly degenerate exciton level Γ_2 in a random anisotropic field due to the anisotropy of the potential wells that localize the excitons. The wavelength and temperature dependence of the degree of polarization of the luminescence due to localized excitons are examined. (15 refs.)

114450 Line width of exciton absorption in solid solutions. N.N.Abyazov, M.E.Raikh, A.L.Efros (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.199-202 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.353-8 (Feb. 1983). [received: Sept. 1983]

The line width of exciton absorption in solid solutions is estimated under the assumption that broadening is due to fluctuations of the composition. Exact expressions for the wings of the absorption line are obtained and an interpolation expression, which reduces to these exact expressions in the appropriate limits, is derived. (10 refs.)

114451 Absorption of light by bound electron-exciton states in two-dimensional molecular crystals. N.I.Grigorchuk (Inst. of Nuclear Res., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.218-22 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.387-93 (Feb. 1983). [received: Sept. 1983]

The Green function method is used to study the spectrum of bound electron-exciton states in a two-dimensional molecular lattice and the absorption coefficient of light due to such states is obtained. Depending on the signs of the effective masses of an electron and of an exciton and on the interaction potential, the case when a bound pair of particles can travel in a crystal is discussed in detail. The effect of bound states on the absorption spectra is discussed. (9 refs.)

114452 Local excitons and effects of their mixing with electronic impurity states in naphthalene. I.V.Brovchenko, L.L.Valkuns, N.I.Ostapenko, S.G.Tret'yakov, M.T.Shpak (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.262-6 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.465-71 (Feb. 1983). [received: Sept. 1983]

Experimental and theoretical investigations of crystals of naphthalene with benzoselenophene impurities showed that the properties of local exciton states in this system are significantly different from those of similar states in crystals of naphthalene with benzofuran, indole and thionaphthene impurities. Three bands of local excitons are obtained (instead of one) at distances of 20, 46 and 72 cm⁻¹ from the exciton band; this is due to the perturbation of three molecules of the crystal simultaneously by the impurity molecule. An anomalous polarization is observed in the local exciton bands: all three are polarized predominantly along the a axis of the crystal, whereas, in cases previously investigated, these bands, situated at the same distances from the exciton band, are polarized predominantly along the b axis. As the local energy level approaches the exciton band their intensity falls, while the polarization ratios increase in favor of the b component. The anomalous

polarization is qualitatively explained by effects of mixing impurity and local states due to intermolecular interactions. (14 refs.)

114453 Emission spectra of electron-hole drops in gallium phosphide. N.R.Nurtdinov, A.E.Yunovich (Moscow State Univ., Moscow, USSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1080-5 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1870-8 (Nov. 1982). [received: Sept. 1983]
The photoluminescence spectra of epitaxial GaP layers with impurity density $\lesssim 10^{16}$ cm⁻³ are investigated at $T=8-60$ K. Emission due to electron-hole drops (EHD) is observed at excitation levels $W=3\times 10^{-2}\text{--}2\times 10^2$ W/cm². The shape of the EHD spectral band with a maximum at $\hbar\omega_m=2.268$ eV is independent of W and T at $T\leq 40$ K, and the band has characteristic recombination times 30 ± 3 nsec and a critical temperature $T_c=50_{-3}^{+3}$ K. The shape of the EHD spectrum is analyzed with account taken of the two-hump structure of the conduction band and of the different ratios of the probabilities of emission of TO , LA , and TA phonons in indirect transitions. The obtained values of the Fermi levels, of the carrier-pair densities in the EHD, and of the binding energy require corrections necessitated by allowance for the phonon dispersion and carrier heating in the EHD. The recombination band assumed to be due to a low-density electron-hole plasma is found to be significant in the quantum-energy region ~ 2.29 eV near the short-wave edge of the EHD band at high T . (22 refs.)

114454 Radiative recombination of localized Mott excitons in a strong magnetic field. V.A.Kharchenko (Leningrad Polytech. Inst., Leningrad, USSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1140-3 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1971-7 (Nov. 1982). [received: Sept. 1983]
The effect is considered of a strong magnetic field on the formation and recombination of Mott excitons localized at defects and impurities in semiconducting crystals. It is shown that the motion of the exciton mass center across the magnetic field plays a decisive role in the formation of localized excitons. It is found that by varying the magnetic-field intensity one can control the relative brightness (radiative recombination probability) of the spectral lines of optical recombination and or absorption of bound excitons. This possibility is due here to the dependence of the effective mass of the transverse motion of the exciton mass center on the magnetic field intensity. (5 refs.)

71.36 POLARITONS

(inc. photon-phonon and photon-magnon interactions)

114455 Self-focusing of polaritons on a metal surface covered by a nonlinear film. V.Ya.Chernyak (Inst. of Spectroscopy, Acad. of Sci., Troitsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.351-2 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.614-16 (Feb. 1983). [received: Sept. 1983]
The problem of self-focusing of surface polaritons is of great interest in the spectroscopy of surfaces. However, the contribution of an electric field (normal to the surface) to the nonlinearity as a surface film was ignored, and this has led to highly overestimated values of the self-focusing length. The author considers a system consisting of two media: $z<0$ and $z>0$ with permittivities ϵ_1 and ϵ_2 at whose interface $z=0$ there is a thin optically nonlinear film with a permittivity $\tilde{\epsilon}(\mathbf{E})=\epsilon_0+a|\mathbf{E}|^2$ depending on an electric field and such that $a|\mathbf{E}|^2\ll\epsilon_0$. The thickness of this film satisfies $L\ll Q^{-1}$, where Q is the wave vector of carriers. (3 refs.)

71.38 POLARONS AND ELECTRON-PHONON INTERACTIONS

(for electron-phonon interactions in lattices, see also 63.20K)

114456 Polaron model of the electronic spectrum and the superconductivity of compounds having the A-15 structure. A.S.Aleksandrov, V.F.Elesin (Engng.-Phys. Inst., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.257-62 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.456-64 (Feb. 1983). [received: Sept. 1983]
The existence of a narrow peak in the electronic density of states in A-15 compounds is explained by a strong electron-phonon interaction that leads to the polaron narrowing of the band. An analytic expression relating the transition temperature T_c to the phonon spectrum is derived under the assumption of a weak and an intermediate-strength coupling. The model allows the explanation of the correlation of T_c with the number of electrons per atom, the temperature dependence of the resistance, the magnitude and temperature dependence of the magnetic susceptibility, and the electronic specific heat. 71.45 COLLECTIVE EFFECTS

114457 The effect of disorder on the quantised Hall conductivity. A.MacKinnon (Blackett Lab., Imperial Coll. London, London, England). <i>J. Phys. C (GB)</i> , vol.16, no.27, p.L945-8 (30 Sept. 1983). It is shown that the quantised value of the Hall conductivity of a two-dimensional electron gas is unaffected by an arbitrary potential through which the Hall current must pass. When the current passes through an insulating region radiation may be emitted at the cyclotron energy. (13 refs.)	
114458 Landau levels in the generalized Kildal-Bodnar model (with Cd₃P₂ and Cd₃As₂ as examples). G.P.Chuiko (Marshal of Engng. Forces V.K. Kharchenko Higher Military Engng. Command Coll., Kamenets-Podolski, Ukrainian SSR). <i>Sov. Phys.-Semicond. (USA)</i> , vol.17, no.3, p.301-3 (March 1983). Translation of: <i>Fiz. & Tekh. Poluprovodn. (USSR)</i> , vol.17, no.3, p.486-8 (March 1983). [received: Sept. 1983] The Bodnar model generalizing the Kildal model which itself is a generalization of the familiar Kane model, does not allow for the anisotropy of the spin-orbit splitting. Bodnar and Kildal assume that $\Delta=\Delta_{\perp}$. Here, Δ is the spin-orbit splitting parameter along a fourfold axis of a tetragonal crystal and Δ_{\perp} is the corresponding parameter in a plane perpendicular to this axis. The sensitivity of the Landau levels and of the spectroscopic splitting factor g to various types of anisotropy of the energy spectrum of carriers suggests that the anisotropy of Δ may be significant in studies of these levels and of g . (8 refs.)

71.45G Exchange, correlation, dielectric and magnetic functions, plasmons

114459 Structure factors and elementary excitations of condensed matter. A.Isihara, Y.Nakane (Dept. of Phys., State Univ. of New York, Buffalo, NY, USA). <i>Physica B & C (Netherlands)</i> , vol.120B+C, no.1-3, p.296-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982). An inelastic electron scattering experiment performed at Princeton on thin films of the quasi one-dimensional organic metal tetrathiafulvalene tetracyanoquinodimethane (TTF-TCNQ) reveals an anomalous negative plasmon dispersion. On the other hand, a recent neutron scattering experiment on liquid ⁴ He at Chalk River shows that the structure factor of this liquid varies with temperature and momentum in an interesting way. In particular, it is observed that at small momentum and above a certain temperature, the structure factor shows an anomalous dip before it starts increasing towards the first peak which is higher for higher temperatures. The structure factors in these completely different systems are related in an analogous way to their elementary excitations which determine the anomalous properties. (7 refs.)
114460 Electron phase transitions in highly anisotropic two-dimensional systems. P.A.Vorob'ev (M.V. Lomonosov State Univ., Moscow, USSR). <i>Sov. Phys.-Solid State (USA)</i> , vol.25, no.2, p.243-6 (Feb. 1983). Translation of: <i>Fiz. Tverd. Tela (USSR)</i> , vol.25, no.2, p.430-5 (Feb. 1983). [received: Sept. 1983] It is shown that correlation effects in strongly anisotropic two-dimensional systems lead to a liquid-gas phase transition. The parameters of the critical point are determined and asymptotic expressions for the densities of the liquid and gas phases are obtained. The width of the dielectric gap in the spectrum of carriers is calculated and it is shown that it is numerically small compared with the Fermi energy. (9 refs.)
114461 Spin splitting of spectrum of two-dimensional electrons in magnetic field parallel to layer. F.T.Vas'ko, N.A.Prima (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR). <i>Sov. Phys.-Solid State (USA)</i> , vol.25, no.2, p.331-2 (Feb. 1983). Translation of: <i>Fiz. Tverd. Tela (USSR)</i> , vol.25, no.2, p.582-4 (Feb. 1983). [received: Sept. 1983] The Hamiltonian of a two-dimensional (2D) electron in an inversion layer or in a nonsymmetric field contains the invariant $V_0[\mathbf{n}\times\mathbf{p}]$ (\mathbf{n} is the normal to the surface, \mathbf{p} is the two-dimensional momentum, and σ is the spin matrix), leading to spin splitting of the spectrum. The authors find the spectrum of 2D electrons in a magnetic field, strictly parallel to the surface. The main result consists in a qualitative conclusion that it is possible for the spectrum to be a highly non-center-of-inversion spectrum for $V_{\text{PF}}\lesssim\mu_{\text{BH}}$. (16 refs.)

114462 Surface plasmon scattering on flat surfaces at grazing incidence. P.E.Batson (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

Ultramicroscopy (Netherlands), vol.11, no.4, p.299-302 (1983).

Reports a study of surface plasmon excitation on the flat, oxide-covered aluminum surface, using high energy electrons which pass the surface at a finite, and sometimes large, impact parameter. The scattering probability dependence on impact parameter agrees qualitatively with classical, quasi-static calculations, which assume that the materials are characterized by homogeneous dielectric constants. A broad intensity maximum near 16 eV is identified as a surface plasmon made possible by the frequency dependence of the aluminum oxide dielectric constant. (13 refs.)

71.50 LOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

(*exc. impurities; for localisation in disordered structures, see 71.55J*)

114463 Localization and interactions. T.M.Rice (Theoretical Phys., ETH Zurich, Zurich, Switzerland).

Europhys. News (Switzerland), vol.14, no.7, p.6-7 (July 1983).

Progress made in the past few years in this field has been remarkable. Not only have spectacular new and unsuspected effects, such as the absence of true metallic conduction in two dimensions been discovered, but also a much better understanding of the metal-insulator transition has been obtained. The goal of a complete understanding, which has eluded us for more than 40 years, is in sight. The talks at the EPS meeting conveyed this progress but gave just a selection of the work underway in many groups in all parts of the world. (no refs.)

71.55 IMPURITY AND DEFECT LEVELS

114464 Pressure dependence of the electron capture cross section of the B hole trap in liquid phase epitaxial gallium arsenide. C.E.Barnes, G.A.Samara (Sandia Nat. Lab., Albuquerque, NM, USA).

Appl. Phys. Lett. (USA), vol.43, no.7, p.677-9 (1 Oct. 1983).

A study of the hydrostatic pressure dependence of the electron capture cross section of the B hole trap in liquid phase epitaxial gallium arsenide has revealed that this cross section is strongly affected by pressure. The results are consistent with, and provide support for, the multiphonon emission model for the capture process at this trap. (12 refs.)

114465 Deep levels in semiconductors. P.J.Dean (Royal Signals & Radar Estab., Malvern, England).

Europhys. News (Switzerland), vol.14, no.7, p.9-10 (July 1983).

The amount of accurate experimental data on many deep level systems has grown rapidly in the past decade. We are still far from a thorough theoretical account of the complete set of properties for any one system, however. Current indications are that each system may require particular, special treatments. Excited states are hard to calculate on the self consistent basis used for ground states. However, useful generic trends have emerged within series of closely related defects or for a given defect in different binary hosts, or as a function of ternary alloy composition. An important joint outcome of the theoretical and experimental work is the recent recognition of the importance of antisite defects in the electronic properties of semiconductors. (no refs.)

114466 Spontaneous tunnel transitions induced by redistribution of trapped electrons over impurity centers. A.A.Berezin (Dept. of Engng. Phys., McMaster Univ., Hamilton, Ontario, Canada).

Z. Naturforsch. Teil A (Germany), vol.38A, no.9, p.959-62 (Sept. 1983).

A system of polyvalent impurity centers in a semiconductor (i.e. Au-centers in Si) is considered. The ground state of the impurity pair $Au^- + Au^0$ (b), where an extra electron is localized on the site a, may be turned into an

excited state due to a change of the charge state of a third nearby impurity site. This happens because of different shifts of the Au^- level at sites a and b due to their different distances from the third center. As a result, the original pair is able to reach a new ground state Au^0 (a) + Au^- (b) through a slow spontaneous tunnel transition. The probability of this transition, when it is accompanied by an emission of a low energy photon, is calculated explicitly. (10 refs.)

114467 Impurity-to-band tunneling in semiconductors. S.Chaudhuri (Univ. Res. Center, Wright State Univ., Dayton, OH, USA), D.D.Coon, R.P.G.Karunasiri.

J. Appl. Phys. (USA), vol.54, no.9, p.5476-8 (Sept. 1983).

Rate formulas for impurity-to-band tunneling from shallow and deep impurity levels are discussed. For the case of deep levels involving carriers bound to neutral impurity centers, it is shown that there is no substantial difference between the results of Anderson and Hoffman and those of Chaudhuri, Coon, Derkits, and Banavar. On the other hand, a different field dependence is found for the case of deep levels associated with carriers bound to charged impurity centers. (20 refs.)

114468 Complex band structure and deep impurities. II. Γ_{15} and Γ_{12} states. K.J.Blow, J.C.Inkson (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

J. Phys. C (GB), vol.16, no.27, p.5267-75 (30 Sept. 1983).

For pt.1 see *ibid.*, vol.15, p.3711 (1982). The authors apply a model described in their paper I to Γ_{15} and Γ_{12} (p-and d-like) impurity states in zincblende structure semiconductors. The complex band structure for these symmetries is obtained and this is then related through the matching conditions, which are different for each irreducible representation, to the impurity wavefunction. These wave functions are then used to calculate the optical cross section and elucidate its dependence on the symmetry of the impurity. (15 refs.)

114469 Three holes bound to a double acceptor: Be^+ in germanium. E.E.Haller, R.E.McMurray, Jr., L.M.Falicov, N.M.Haegel, W.L.Hansen (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Phys. Rev. Lett. (USA), vol.51, no.12, p.1089-91 (19 Sept. 1983).

A double acceptor binding three holes has been observed for the first time with photoconductive far-infrared spectroscopy in beryllium-doped germanium single crystals. This new center, Be^+ , has a hole binding energy of ~ 5 meV and is only present when free holes are generated by ionization of either neutral shallow acceptors or neutral Be double acceptors. The Be^+ center thermally ionizes above 4K. It disappears at a uniaxial stress $\geq 10^8$ dyn cm^{-2} parallel to [111] as a result of the lifting of the valence-band degeneracy. (11 refs.)

114470 The use of spatially-dependent carrier capture rates for deep-level-defect transient studies. G.P.Li, K.L.Wang (Electrical Engng. Dept., Univ. of California, Los Angeles, CA, USA).

Solid-State Electron. (GB), vol.26, no.9, p.825-33 (Sept. 1983).

The spatial dependence of the free carrier capture rate for the defect states located near the edge of the depletion layer is investigated. A theoretical treatment is presented here to illustrate the strong variation of the capture rate near the depletion edge with distance. If a transient capacitance technique is used to observe this capture transient, computer-calculated data confirm that the resulting signal comes only from the capture of electrons by those states located near the point at which the Fermi level and the deep level intersect. The capture of electrons by the states that are located in regions other than near the intersection point does not contribute to the detectable signal. Thus the transient signal measures the empty state concentration in a narrow region. Since the electric field in the narrow region can be accurately chosen by the use of different reverse pulse heights, the empty state concentration at that region can be controlled by the emission at different field strengths. The electric field dependence of the emission rate can be measured directly from the capture transient capacitance. Detailed comparisons of the calculated and experimentally measured data show good agreement. Possible applications using this technique in the study of deep-level defects are outlined. (8 refs.)

114471 Impurity states in undoped β -TiInS₂ crystals. A.E.Bakhyshov, S.R.Samedov, M.Ben'yamin, V.E.Bagiev, S.Bules, V.I.Tagirov (S.M. Kirov Azerbaidzhan State Univ., Baku, Azerbaidzhan SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.307-8 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.493-6 (March 1983).

[received: Sept. 1983]

The authors report the results of a study of impurity states in undoped β -TiInS₂ single crystals grown by the directional crystallization method. Measurements of the thermally stimulated current (TSC) were made as follows: a sample was cooled to 100K, a field of 100 V/cm intensity was then applied and at the same time the sample was illuminated with light of photon energy $h\nu \geq E_g$ for 15-20 min. After the end of illumination and establishment of a quasisteady state (at 100K), the sample was heated at a constant rate and the TSC curves were recorded. (11 refs.)

114472 Possibility of formation of an inverted distribution function of free carriers in semiconductors as a result of capture by shallow neutral impurities. E.M.Gershenzon, A.P.Mel'nikov, R.I.Rabinovich, V.B.Smirnova (V.I. Lenin State Pedagogical Inst., Moscow, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.311-12 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.499-501 (March 1983).

[received: Sept. 1983]

The authors consider the formation of an inverted distribution function. When photoelectrons of energy $\epsilon \ll R_y$ are captured by shallow natural impurities, giving rise to negatively charged donors D^- (analogs of the negative hydrogen ion H^-), a one-phonon inelastic process becomes important and the lifetime τ may become shorter than τ_e . (6 refs.)

114473 Determination of the positions of iron impurities in gallium arsenide and phosphide by the ENDOR method. V.V.Teslenko (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.330-2 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.526-8 (March 1983).

[received: Sept. 1983]

The author reviews the ENDOR data and obtains additional information on the interaction of iron impurities with ligand nuclei. Crystals used, were grown by the Czochralski method. They were doped with iron in the melt. Crystals grown by this method had seminsulating properties. The ENDOR spectra were determined using a superheterodyne spectrometer operating in the 3-cm range. The measurements were made at 4.2K. The ESR spectra included signals with the parameters $g=2.042$, $120B_0=330.10^{-4}$ cm⁻¹ and $g=2.025$, $120B_0=390.10^{-4}$ cm⁻¹ in the case of GaAs and GaP, respectively. These signals were due to an ion with the 3d⁵ configuration in the $^{65}S_{1/2}$ state. The concentrations of this ion were 10^{17} and 3.10^{17} cm⁻³ for GaAs and GaP, respectively. (9 refs.)

114474 Energy spectrum of defects in silicon irradiated with hydrogen and helium ions. A.I.Aeshin, L.S.Smirnov, V.F.Stas' (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.348-9 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.551-3 (March 1983). [received: Sept. 1983]

Describes a study carried out by the deep level transient spectroscopy (DLTS) method which yielded the spectrum of defects generated by light hydrogen and helium ions, and gave information on the behavior of defects during annealing. The authors investigated oxygen-free silicon doped with phosphorus and gold (BKEFZ-3 grade). A p-n junction was formed by implantation of boron ions followed by 30-min annealing at 980°C. Diode structures were irradiated with hydrogen and helium ions in a Van de Graaff accelerator. After fabrication of mesa-diode structures, the irradiated and control (unirradiated) samples were annealed isochronously by 600°C. Unirradiated samples had deep centers with levels at $E_c-0.24$ and $E_c-0.54$ eV, typical of the gold atoms. The concentrations of these centers were not affected by the isochronous annealing. (5 refs.)

114475 Detection of electronic defects in strip-heater crystallized silicon thin films. N.M.Johnson, M.D.Moyer, L.E.Fennell (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA), E.W.Maby, H.Atwater.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.491-7. Electronic defects in strip-heater crystallized silicon thin films have been investigated with capacitance-voltage (C-V), deep-level spectroscopic, and scanning-electron microscopic techniques. For electrical characterization the crystallized silicon films were used to fabricate inverted metal-oxide-silicon capacitors in which degenerately doped bulk silicon substrates provided the gate electrode. High-frequency C-V characteristics yield effective fixed-charge densities in the oxide of $\leq 2 \times 10^{11} \text{ cm}^{-2}$. Trap-emission spectra, recorded with deep-level transient spectroscopy on both p-type and n-type capacitors, indicate a continuous distribution of deep levels throughout the silicon bandgap. The Si-SiO₂ interface is considered to be the principal source of this deep-level continuum, since the films are essentially single crystal with a low density of subgrain boundaries; the effective interface-state density is $\leq 2.5 \times 10^{10} \text{ eV}^{-1} \text{ cm}^{-2}$. A discrete energy level, detectable above the background continuum, appears in the upper half of the silicon bandgap; it may identify a point defect in the bulk of the silicon film with a spatially uniform density of approximately $1 \times 10^{13} \text{ cm}^{-3}$. On lateral p-n junction diodes, electron-beam-induced-current images reveal enhanced diffusion of arsenic along structural defects intersecting the junction. (18 refs.)

114476 Chalcogenides in silicon. H.G.Grimmeiss, E.Janzen (Dept. of Solid State Phys., Univ. of Lund, Lund, Sweden). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.33-44. If a host atom in Si is replaced by an atom from the sixth group in the periodic table, two extra electrons are available, which may give rise to double donors. In addition, the ground state of chalcogenide atoms in Si lies at much greater distance from the conduction band than impurity atoms from the fifth group and so chalcogenides create deep levels. The energy spectrum of a group VI impurity in Si is discussed and the spin-valley splitting of the $1s$ (T_2) state is examined. The optical absorption spectrum and Fano resonances are also described. (34 refs.)

114477 Metastable defect configurations in semiconductors. J.L.Benton, M.Levinson (Bell Labs., Murray Hill, NJ, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.95-100.

Deep Level Transient Spectroscopy is used to examine the stability of defect configurations in Si and InP. A systematic approach has been developed to study alternate structures of metastable defects through their representative electronic states. Regulation of defect charge state prior to analysis reveals dramatic transformations in the resulting spectra. These defect states are metastable and can be controlled with thermal or electronic energy. Model studies in electron irradiated InP and Si are presented. The barriers to configurational change are determined from the reaction kinetics. The roles of electric field, minority carrier injection and charge state are explored through junction bias techniques. It is believed that the observed behavior represent a new class of defect reactions. The systematics of detecting and studying these reactions are presented. Model defect structures are discussed. (9 refs.)

114478 Thermal donor formation by the agglomeration of oxygen in silicon. U.Gosele (Max-Planck-Inst. für Metallforschung, Stuttgart, Germany), T.Y.Tan.

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.153-7. The authors suggest that thermal donor formation in silicon involves fast-diffusing, gas-like molecular oxygen in dynamical equilibrium with atomic oxygen in interstitial position. They discuss still remaining difficulties in understanding thermal donor formation in the light of recent experimental observations by Stavola et al. (1983), indicating that the diffusivity of interstitial oxygen apparently depends on the thermal history of the silicon sample. (18 refs.)

114479 Complex defects in GaAs and GaP. P.J.Lin-Chung (Naval Res. Lab., Washington, DC, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.267-70. A study of the electronic states associated with divacancy defects and with the defect complexes involving an anion antisite with a group IV atom (A_c-IV) in GaAs and GaP is reported. The local densities of states have been determined using the large cluster recursion approach. The properties as well as the position of the GaP states of the divacancy defect in GaAs are found to be consistent with the experimental results for the EL2 level. The change of the position of the defect levels of (A_c-IV) as a result of the change of bonding is analyzed. The effect of GaAs-AlAs interface on the (A_c-IV) defect level is also examined. (8 refs.)

114480 Process-induced defects in high-purity GaAs. P.M.Campbell, O.Aina, B.J.Baliga, R.Ehle (General Electric Res. & Dev. Center, Schenectady, NY, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.283-7. High temperature annealing of Si₃N₄ and SiO₂ capped high purity LPE GaAs is shown to result in a reduction in the surface carrier concentration by about an order of magnitude. Au Schottky contacts made on the annealed samples were found to have severely degraded breakdown characteristics. Using deep level transient spectroscopy, deep levels at E_c-58 eV, E_c-785 eV were detected in the SiO₂ capped samples and E_c-62 eV, E_c-728 eV in the Si₃N₄ capped samples while none was detected in the unannealed samples. The electrical degradations are explained in terms of compensation mechanisms and depletion layer recombination-generation currents due to the deep levels. (9 refs.)

114481 Electrical properties of dislocations and boundaries in semiconductors. H.J.Quisser (Max-Planck-Inst. für Festkörperforschung, Stuttgart, Germany).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.323-41.

Simple models have been suggested to predict electronic properties of lattice defects in semiconductor crystals: dislocations ought to act via the acceptor character of dangling bonds, and small-angle grain boundaries ought to consist of regular arrays of dislocations. The actual situation in most semiconductors is, however, much more complicated. The observed electrical effects of dislocations do not confirm the dangling-bond concept, they are affected by dissociation and reconstruction. There appear to be differences between straight and kinked dislocations. Dislocations owe much of their electronic behavior to clouds and precipitates of impurities; oxygen in silicon plays a significant role. This review summarizes the present status of experimental methods and results, including luminescence and capacitance spectroscopy as well as mapping and imaging techniques using electron-microscopes. (95 refs.)

114482 Electronic states of grain boundaries in bicrystal silicon. C.M.Shyu, L.J.Cheng (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), K.L.Wang.

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.363-7.

Electronic states at a 20° symmetrical (100) tilt boundary in p-type silicon were studied using deep level transient spectroscopy (DLTS) and other electrical measurements. The data can be explained with a model in which the local barrier height at the grain boundary varies on a scale much smaller than the boundary plane ($\sim 1 \text{ nm}^2$) under study. Based on a relationship between the carrier capture cross section and energy level deduced from the experimental data, the authors have been able to calculate the distribution of the density of states in the energy bandgap at the boundary, which contains two groups of continuously distributed states; a major one whose density of states increases monotonically with the position of the state from the valence band, and a minor narrow one whose density of states is centered at $E_v+0.20$ eV. (9 refs.)

114483 Quenched-in defects in CW laser irradiated virgin silicon.

A.Chantre, M.Kechouane, D.Bois (CNET/CNS, Meylan, France). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.547-51.

Quenched-in defects in CW laser irradiated silicon have been identified using deep level transient spectroscopy. Four among the five dominant defect states arise from transition metal impurities (iron, chromium) present in precipitates in the as-grown material and dispersed into the crystal upon heat treatment. Native defects are involved in the form of phosphorous-vacancy complexes, which account for the remaining level. (18 refs.)

71.55J Localization in disordered structures

- 114484** Reduction in the localized band-gap states in amorphous silicon by annealing and hydrogen implantation. G.W.Neudeck, T.C.Lee (School of Electrical Engng., Purdue Univ., West Lafayette, IN, USA). *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.680-2 (1 Oct. 1983). The effect of in situ thermal annealing prior to hydrogen implantation is reported on vacuum evaporated amorphous silicon. By performing a 400°C anneal for 4 h immediately following film deposition the film porosity is greatly reduced. The film is then implanted with hydrogen to a dose of $5 \times 10^{16}/\text{cm}^2$. A field-effect conductance change of six orders of magnitude was observed which yielded a density of localized states near the Fermi level of $4 \times 10^{17}/\text{cm}^3 \text{ eV}$. (16 refs.)
- 114485** Deep-level spectroscopy of reactively sputtered a-Si:H films. Ai-Lien Jung, Jin-Shen Luo, Xi Yao, Chen-Hsi Lin, Ya-Wen Yang, D.Adler (Center for Materials Sci. & Engng., MIT, Cambridge, MA, USA). *J. Non-Cryst. Solids (Netherlands)*, vol.57, no.2, p.241-50 (1 Sept. 1983). The authors have performed light-induced modulation of absorption spectroscopy, thermally stimulated current spectroscopy, capacitance measurements as a function of temperature and frequency, and electron spin resonance experiments on reactively sputtered a-Si:H films. They find evidence for seven different localized gap states in a range of $\pm 0.4 \text{ eV}$ around the midgap region. The possible origin of these states is discussed. (10 refs.)
- 114486** Determination of localized state distributions from anomalously-dispersive transport data. H.Michiel, J.M.Marshall, G.J.Adriaenssens (Lab. voor Vaste Stof en Hoge Druk-fysica, Katholieke Univ., Leuven, Belgium). *Philos. Mag. B (GB)*, vol.48, no.2, p.187-202 (Aug. 1983). A general relation is deduced between the density of localized states $N(E)$ and the transient photocurrent $I(t)$ for an amorphous semiconductor exhibiting trap-controlled electronic transport. It is demonstrated that the waiting-time distribution function $\psi(t)$ is related to $I(t)$ through a Volterra integral equation, which may be solved numerically. The relative density of states $N(S)$ may be deduced in a straightforward manner from $\psi(t)$, using an approximation which should not introduce more than a small degree of distortion. The computational method is applied to the case of an exponential tail of localized states, and to a system with three discrete sets of trapping centres. Finally, the consequences of an incomplete knowledge of some of the system parameters are considered. (23 refs.)

- 114487** Change in samarium valence in $\text{SmB}_6\text{-NdB}_6$ solid solutions. M.I.Aivazov, S.V.Aleksandrovich, B.A.Evseev, V.S.Mkrtychyan, V.N.Sorokin, O.M.Tsarev. *Inorg. Mater. (USA)*, vol.18, no.9, p.1298-301 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1518-20 (Sept. 1982). [received: Sept. 1983]
- Two isostructural samarium hexaboride phases have been used in synthesizing $(\text{Sm}_{1-x}\text{Nd}_x)_2\text{B}_6$ solid solutions with the CaB_6 structure. When up to 30% of the samarium is replaced by neodymium, one gets solid solutions in the $\alpha\text{-SmB}_6\text{-NdB}_6$ ($y=1$) and $\beta\text{-SmB}_6\text{-NdB}_6$ ($y=0.8$) systems. For $x>0.3$ there is a region of homogeneity in the metal $0.8 \leq y \leq 1$. It is found that the average valence of the samarium ions decreases linearly as the samarium is replaced by neodymium. (6 refs.)
- 114488** Valence instabilities in rare earth systems as revealed by photoemission. R.A.Pollak (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.201-2 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). The author used high resolution ($\delta E < 150 \text{ meV}$) photoemission with synchrotron radiation in the range 10 eV $< h\nu < 130 \text{ eV}$ to study archetypal mixed valent and related cerium-, samarium-, europium-, thulium- and ytterbium-based systems. Generally all mixed valent systems (except the cerium-based

system which is not yet fully characterized) exhibit an integer valent surface layer which has the lower value of the two bulk valence configurations. Temperature-dependent changes in bulk valence were observed in the europium and samarium compounds. Mixed valence was observed to persist down to at least 5 at.% dilution of thulium in $\text{Tm}_x\text{Y}_{1-x}\text{Se}$ while thulium appears to remain trivalent in all $\text{Tm}_x\text{Y}_{1-x}\text{S}$ compounds studied. (10 refs.)

114489 Photon-stimulated desorption from rare earth oxides. G.Loubriel (Sandia Nat. Labs., Albuquerque, NM, USA), C.C.Parks. *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.213-18 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). Resonances in the photon-stimulated desorption (PSD) spectra of praseodymium, samarium, erbium, thulium and ytterbium oxides are reported at photon energies near their 4d edges. These resonances, which are also seen in soft X-ray absorption (SXA), arise from excitations of 4d electrons to the 4f shell. Comparisons of SXA and PSD show how PSD can be used to determine surface valency. (14 refs.)

114490 The role of the exchange interaction in the valence transition of Sm chalcogenides. N.Porrás-Montenegro (Dept. de Física, Univ. del Valle, Cali, Colombia). *Phys. Lett. A (Netherlands)*, vol.97A, no.5, p.202-6 (29 Aug. 1983). The indirect exchange interaction J between localized and conduction electrons has been included in the Hamiltonian of the hybridized RKK model. It was found that there are continuous and discontinuous transitions of $\langle \eta \rangle$ for different values of J . (13 refs.)

71.70C Crystal and ligand fields

114491 Two-dimensional dynamical Jahn-Teller effects in a mixed-valence benzotriazolato copper cluster, $\text{Cu}_5(\text{BTA})_6(\text{RNC})_4$. G.F.Kokoszka, J.Baranowski, C.Goldstein, J.Orsini, A.D.Mighell, V.L.Himes, A.R.Siedle (Dept. of Chem., State Univ. of New York, Plattsburg, NY, USA). *J. Am. Chem. Soc. (USA)*, vol.105, no.17, p.5627-33 (24 Aug. 1983). Clusters of composition $\text{Cu}_5(\text{BTA})_6(\text{RNC})_4$ [$\text{BTA} = \text{benzotriazolato}(1-)]$ were prepared from the reaction of copper(I) thiophenoxide, benzotriazole, and an organic isocyanide. $\text{Cu}_5(\text{BTA})_6(t\text{-C}_4\text{H}_9\text{NC})_4$ crystallizes in space group $P4_2/c$, $a = 13.836$ (4) Å, $c = 16.686$ (4) Å, $Z = 2$, $D_{\text{calc}} = 1.413$, $D_{\text{obsd}} = 1.41$ (2) Mg m^{-3} . The structure solution, based on 903 reflections, converged at $R = 0.063$ and $R_w = 0.047$. The molecular structure has 4 symmetry; compressed octahedral copper(II) is surrounded by four tetrahedrally coordinated copper(I) ions. η_5 -benzotriazolato(1-) ligands connect each Cu(I) ion with three symmetry-related Cu(I) sites and with the central Cu(II). Terminal $t\text{-C}_4\text{H}_9\text{NC}$ ligands are bonded to Cu(I). EPR data were obtained at various temperatures in the liquid nitrogen to room temperature range. Data were recorded at 9, 24, and 54 GHz. The large Cu(II)-Cu(II) distance of 12.858 Å in this cluster ensures that the effects of exchange interactions are virtually nonexistent and that electronic dipolar broadening would be small. The appearance of Cu(II) hyperfine structure in almost all of the spectra supports this expectation. Furthermore, the EPR data are not consistent with a d_{z^2} ground state in spite of the compressed octahedral molecular geometry. At low temperatures, the EPR spectra are quite normal: $g_{\parallel} = 2.271$ (4), $g_{\perp} = 2.069$ (4), $A_{\parallel} = (145 \pm 4) \times 10^{-4} \text{ cm}^{-1}$, and $A_{\perp} = 0$, consistent with a $d_{x^2-y^2}$ type ground state. Above 128K, a 'reversed spectrum' is observed and is interpreted in terms of a two-dimensional dynamical Jahn-Teller effect. The other three compounds also showed interesting temperature-dependent effects. (31 refs.)

114492 Zeeman spectroscopy of crystal-field transitions of Co-doped InP. M.J.Kane (Clarendon Lab., Univ. of Oxford, Oxford, England), C.Uihlein, M.S.Skolnick, P.J.Dean, W.Hayes, B.Cockayne. *J. Phys. C (GB)*, vol.16, no.27, p.5277-91 (30 Sept. 1983). The 474.0 meV and 785.8 meV crystal-field transitions of Co_2^{2+} in InP observed in photoluminescence (PL) and optical absorption respectively are studied in magnetic fields of up to 10 T. The 474.0 meV PL line is shown to arise from a $\Gamma_8\text{-}\Gamma_8$ transition in T_d symmetry between the lowest spin-orbit state (Γ_8) of the ${}^4T_2(\text{F})$ level of Co_2^{2+} and the spin-only $\Gamma_8({}^4A_2(\text{F}))$ ground state. The anisotropic g -values of the excited state, g_{\parallel} and g_{\perp} , are 5.48 ± 0.2 and -2.98 ± 0.15 respectively. An isotropic g -value of 2.14 ± 0.05 is obtained for the ground state, in agreement with the results of electron spin resonance on Co_2^{2+} . The Zeeman pattern of the 785.8 meV absorption line shows a marked trigonal (C_{3v}) symmetry due to Jahn-Teller (JT) coupling to T_2 distortion modes in the excited state. The Zeeman data are shown to be consistent with the behaviour expected from the ${}^4A_2(\text{F}) \rightarrow {}^4T_1(\text{F})$ transition of Co_2^{2+} , the ${}^4T_1(\text{F})$ state undergoing an almost static JT distortion. Anticrossings in the anisotropy plot of the Zeeman pattern are observed at the main symmetry directions. This cannot be explained on a model of static C_{3v} trigonal complexes, and is attributed to tunnelling between the magnetically equivalent distortion directions. Analysis of the Zeeman data gives $g_{\parallel} = 0.96 \pm 0.05$ and $g_{\perp} = 3.76 \pm 0.05$ for the ${}^4T_1(\text{F})$ excited state and $g = 2.10 \pm 0.10$ for the ${}^4A_2(\text{F})$ ground state. (15 refs.)

114493 Crystal field effects on 4f electrons: theories and reality. M.Faucher, D.Garcia (Lab. des Elements de Transition dans les Solides, CNRS, Meudon Bellevue, France). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.31-44 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). The present methods of calculating crystal field effects in a solid are examined. Several models intermediate between the entirely phenomenological model leading to the determination of the so-called 'experimental' crystal field parameters and a complete linear combination of atomic orbitals calculation have been constructed. In these models simplifying hypotheses lead to descriptions of crystal field effects which have some degree of parametricity, so that the term 'a priori determination' is sometimes misleading and should be redefined. The most sophisticated models are characterized by the smallest number of a priori assumptions. However, it is questionable whether an

increase in sophistication improves the agreement between theory and experiment. Practical methods of calculating crystal field parameters, i.e. in the framework of the electrostatic, angular overlap and weakly covalent models, are described. (48 refs.)

114494 Localized systems mechanisms for f-f transition probabilities in lanthanide coordination compounds. S.F.Mason (Chem. Dept., King's Coll., London, England).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.45-58 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The origins and development of the ligand polarization mechanism for f-f transition probabilities in lanthanide coordination compounds are briefly surveyed. Applied initially to lanthanide(III) complexes containing monoatomic ligands, which have an effectively isotropic polarizability, the mechanism is found to depend, on extension to the corresponding polyatomic ligand cases, on the anisotropy of the ligand polarizability tensor in complexes of the higher non-centric symmetries. The crystal field and the ligand polarization mechanisms make complementary intensity contributions to the f-f transitions of a given lanthanide(III) complex type which are dependent on the rank of the leading electric multipole transition moment. The latter mechanism contributes principally to the intensities of the ligand-hypersensitive 2^2 -pole f-f transitions, whereas the former mechanism is predominant for the 2^6 -pole transition intensities and makes the more important contribution in the 2^4 -pole cases. (72 refs.)

114495 Crystal field of europium doped in yttrium oxychloride: the covalent model. D.Garcia, M.Faucher (Lab. des Elements de Transition dans les Solides, CNRS, Meudon Bellevue, France).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.119-25 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

A weakly covalent model is applied to calculate the crystal field splittings of the 4f energy levels of europium doped in yttrium oxychloride. The diagonal element of the hamiltonian matrix is approximated using a published orbital eigenvalue in the neutral atom ground state. The approximation proposed by Wolfsberg and Helmholz (1952) is utilized to evaluate the off-diagonal matrix elements for electron-electron interaction within a group of atoms including the rare earth and its nine first-nearest neighbours (four oxygen atoms and five chlorine atoms). The basis wavefunction of the interaction hamiltonian includes the 4f wavefunctions of the rare earth, the 2p and 2s wavefunctions of the four oxygen atoms, and the 3p and 3s wavefunctions of the five chlorine atoms. Ligand-ligand interactions are taken into account. The 4f electron energy levels lie well above the ns and np levels of the ligands so that the diagonalization of the interaction hamiltonian results in a small antibonding lifting of the degeneracy. The contribution to the splitting of the 4f orbitals from the remainder of the lattice (more distant ions) is calculated using the electrostatic model including consistent dipoles and is added to the first-neighbour contribution. (20 refs.)

114496 Further interpretation of the spectra of Pr^{3+} - LaF_3 and Tm^{3+} - LaF_3 . W.T.Carnall, H.Crosswhite (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.127-35 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The results of model crystal field calculations in C_{2v} symmetry for Pr^{3+} - LaF_3 and Tm^{3+} - LaF_3 are compared with experimental data for the nearly complete f^2 (f^2) configurations. It is shown that the method used results in computed levels that generally correlate closely with level energies deduced from experiment. However, a number of important new insights are gained and some previous assignments are questioned. (11 refs.)

114497 The experimental determination of second-rank crystal field parameters for rare earth compounds. E.Antic-Fidancev, M.Lemaitre-Blaise, P.Caro (Lab. des Elements de Transition dans les Solides, CNRS, Meudon Bellevue, France).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.137-42 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The second-rank crystal field parameters obtained for some Gd^{3+} and Eu^{2+} compounds with the $(4f)^7$ configuration using the experimental ${}^6\text{P}_{7/2}$ overall splitting and the intermediate Stark components can be tested by comparing the calculated ratios of the overall splitting of the three ${}^6\text{P}_i$ levels with the experimental values. The calculated value for ${}^6\text{P}_{7/2}/{}^6\text{P}_{5/2}$ is roughly 1.80, for ${}^6\text{P}_{7/2}/{}^6\text{P}_{3/2}$ it is 2.80 and for ${}^6\text{P}_{5/2}/{}^6\text{P}_{3/2}$ it is 1.55. The experimental values are usually in reasonable agreement with the theoretical values. Deviations may be due to a misidentification of the levels or to a very low symmetry such that the spacings cannot be adjusted using only two second-rank crystal field parameters. (14 refs.)

114498 Crystal field theory: past, present and future. D.J.Newman (Dept. of Phys., Univ. of Hong Kong, Hong Kong).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.235 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given, as follows. Both the phenomenological and the ab initio approaches to interpreting crystal field splitting are described. The phenomenological approach is viewed as a hierarchy of parametrized models, each model being characterized by explicit hypotheses about the nature of the crystal field. Ab initio calculations can be made in relation to any level of this hierarchy, the hypotheses of the phenomenological model being included in the calculation. It is emphasized that the ab initio approach is necessary to bring the theory into contact with experimental data other than crystal field splitting. Several possible lines of future development are described, including extensions of the phenomenological approach to include new systems, such as metals, and ways of improving the description of the experimental data by including more parameters. Developments of the theory of transition intensities and dynamic crystal field interactions are also discussed. (no refs.)

114499 Spin-correlated crystal field effects in lanthanide ions. W.Y.P.Fung, D.J.Newman (Dept. of Phys., Univ. of Hong Kong, Hong Kong).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.241 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given as follows. Ab initio calculations of overlap and covalency contributions to the spin-correlated crystal field (SCCF) in Pr^{3+} with a single ligand are described. It is shown that covalency provides a positive contribution to the c_2 parameters describing the SCCF, thus giving a possible explanation of some characteristic experimental results. Numerical results for various types of contribution to the SCCF are tabulated. (no refs.)

114500 Analysis of the Pr^{3+} spectrum in the incommensurate phase of ThCl_4 . C.Khan Malek, J.C.Krupa, M.Genet (Lab. de Radiochimie, Inst. de Phys. Nucleaire, Orsay, France).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.241 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given. The crystal energy level structure problem in the Pr^{3+} ($4f^3$) configuration is formally equivalent to that for its isoelectronic actinide ion U^{4+} ($5f^3$). The modulated and incommensurate low temperature phase of the matrix in a U^{4+} doped single crystal of ThCl_4 produces characteristic lineshapes owing to the modulation of the crystal field. The modulation of the halide position reduces the site symmetry from D_{2d} to D_2 and, as has been shown from spectral singularities, some of the U^{4+} impurity ions pin the phase of the modulation and remain in D_{2d} sites. This behaviour is not obvious in the Pr^{3+} - ThCl_4 spectra where the lineshapes are more conventional and the transitions are less intense. This is due to the fact that the protected 4f electrons are less sensitive to the crystal field manifestation than are the 5f electrons which are characterized by a greater extension of the radial wavefunction. As a consequence the crystal Stark splitting is roughly half that in U^{4+} - ThCl_4 and the SLJ multiplets of Pr^{3+} can easily be labelled because there is no significant overlapping except, possibly, in the weak lines of the ${}^1\text{I}_6$ group. 34 crystal field states were identified as being associated with D_{2d} site symmetry and were fitted to the parameters with a deviation of 29 cm^{-1} . (no refs.)

114501 Emission spectrum and crystal field parameters of pentanitratouropate (III) ions. J.-C.G.Bunzli, B.Klein, G.-O.Pradervand (Inst. de Chimie Minerale et Analytique, Univ. de Lausanne, Lausanne, Switzerland), P.Porcher.

J. Less-Common Met. (Switzerland), vol.93, no.1, p.241-2 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given, as follows. A spectroscopic investigation at 77K of finely powdered samples of $\text{A}_2[\text{Eu}(\text{NO}_3)_5]$ with $\text{A} \equiv (\text{C}_6\text{H}_5)_4\text{As}^+$, $(\text{C}_6\text{H}_5)_3\text{P}^+$ and $(\text{CH}_3)_4\text{N}^+$ is reported. The crystal structure of $((\text{C}_6\text{H}_5)_4\text{As})_2[\text{Eu}(\text{NO}_3)_5]$ reveals a ten-coordinate polyhedron which can be approximately fitted to a bicapped dodecahedron; the site symmetry of the europium(III) ion is C_2 . However, if the nitrate ions are assumed to occupy one coordination site, the resulting polyhedron is almost a trigonal bipyramid and this pseudosymmetry is reflected in the pattern of the emission spectrum. The authors have attempted to reproduce the crystal field splitting by various sets of parameters using the method of descending symmetry. For $((\text{C}_6\text{H}_5)_3\text{P})_2[\text{Eu}(\text{NO}_3)_5]$ standard deviations of 18 cm^{-1} and 11 cm^{-1} are obtained with hamiltonians of D_{3h} and C_{2v} symmetry respectively. The influence of the counter-cation on the local pseudosymmetry is discussed. (2 refs.)

114502 Hyperfine fields of ${}^{61}\text{Ni}$ in an Ni-Fe alloy. V.S.Pokatilov (I.P. Bardin Central Sci.-Res. Inst. of Ferrous Metall., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1065-7 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1368-70 (Dec. 1982). [received: Sept. 1983]

The author studies the influence of the environment on the hyperfine fields of ${}^{61}\text{Ni}$ in an Ni-Fe alloy with the aim of separating the contributions to the hyperfine field from the nickel atom and from its nearest-neighbor environment. (8 refs.)

71.70E Spin-orbit coupling, Zeeman, Stark and strain splitting

114503 The lowest triplet state of tetramethyl-1,3-cyclobutanedithione. II. Calculation of spin-orbit coupling. J.Baiardo, M.Vala (Dept. of Chem., Univ. of Florida, Gainesville, FL, USA).

Chem. Phys. (Netherlands), vol.79, no.3, p.403-12 (15 Sept. 1983). For pt.1 see ibid., vol.79, p.391 (1983). A calculation of the spin-orbit coupling in the lowest excited triplet state of tetramethyl-1,3-cyclobutanedithione (TMCBDT) has been performed. The results show the following. (1) In the TMCBDT crystal the ground single-to-lowest triplet transition moment is predicted to be exclusively \perp c polarized as observed. (2) The assignment of the lowest triplet state should be ${}^3\text{A}_{u_g}$, as found earlier for the oxygen analog, TMCBD. (3) The two largest contributors ($\approx 60\%$) to the isolated-molecule $\text{T}_{1u} \rightarrow \text{S}_0$ transition moment come from the two triplet-triplet transitions ${}^3\text{n}_+\pi^* \leftarrow {}^3\text{n}_+\pi^*$ and ${}^3\text{n}_-\pi^* \leftarrow {}^3\text{n}_+\pi^*$, both of which are polarized along the C=S bonds. (4) The total contribution to the transition moment parallel to the C=S bonds is 76% from the $\text{T}_{1u} \rightarrow \text{T}_1$ transitions and 24% from the $\text{S}_k \rightarrow \text{S}_0$ transitions. And, finally, (5) the calculated oscillator strength of

2×10^{-4} for the largest $T_1\leftarrow S_0$ component (along y) falls within the range of typical spin-allowed, singlet-singlet $n\pi^*$ transitions. (14 refs.)

114504 Suppression by a longitudinal magnetic field of spin relaxation of conduction electrons in semiconductor crystals lacking an inversion center. V.A.Marushchak, M.N.Stepanova, A.N.Titkov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *JETP Lett. (USA)*, vol.37, no.7, p.400-3 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.337-40 (5 April 1983). [received: Oct. 1983]
Experiments have shown that the orbital motion of conduction electrons in a magnetic field effectively suppresses the spin relaxation of electrons caused by the spin-orbit splitting of the conduction band in crystals lacking an inversion center. (11 refs.)

114506 Electrical conductivity and galvanomagnetic properties of $SbCl_5$ intercalated graphite. E.I.Khar'kov, L.L.Koletsnichenko, L.Yu.Matsui (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.338-9 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.594-6 (Feb. 1983). [received: Sept. 1983]
The authors report an investigation of the electrical conductivity, magnetoresistance and Hall coefficient of $SbCl_5$ intercalated graphite based on fine grained highly oriented pyrolytic graphite. The measurements were carried out by the usual four probe method. (14 refs.)

114507 Electrical resistivity and magnetoresistivity of amorphous $Fe_{80}B_{20}$, $Fe_{80}B_{18}Si_2$, $Fe_{80}B_{13}Si_4C_3$ and $Cu_{60}Zr_{40}$ alloys. Y.D.Yao (Inst. of Phys., Acad. Sinica, Taipei, Taiwan), S.Arajs, S.T.Lin. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.243 (Dec. 1982). [received: Sept. 1983]
The authors report measurements on the temperature dependent electrical resistivity and on the field dependence of magnetoresistivity on the amorphous nonmagnetic alloy $Cu_{60}Zr_{40}$ and the amorphous ferromagnetic alloys $Fe_{80}B_{20}$, $Fe_{80}B_{18}Si_2$ and $Fe_{80}B_{13}Si_4C_3$. (no refs.)

114508 Features of the electrical resistivity of liquid tungsten under conditions of restricted volume and of free expansion. V.V.Ivanov, S.V.Lebedev, A.I.Savvatimskii (Inst. of High Temperatures, Acad. of Sci., USSR). *High Temp. (USA)*, vol.20, no.6, p.862-7 (Nov.-Dec. 1982). Translation of: *Teplotiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1093-7 (Nov.-Dec. 1982). [received: Sept. 1983]
It is found that on heating metals with a pulsed current of high density without restricting expansion, the quantity $K=m/\alpha T$ entering the expression for the resistivity (α is the number of conduction electrons per atom, τ and m are there relaxation time and effective electron mass) decreases for tungsten and increases for Cu, Au, Ni, Ir, and Rh at the initial stage of the liquid state. The observed decrease in K is related to the thermal expansion of the liquid tungsten: on heating in a restricted volume, the fall in K at the beginning of the liquid region is less pronounced. For liquid copper restricting the volume weakens the rise in K compared with the case of heating with free expansion. (9 refs.)

114509 Electrical resistance of Fe-Zr and Fe-Ni-Zr amorphous alloys under hydrostatic pressure. K.Shirakawa (Res. Inst. of Electric & Magnetic Alloys, Sendai, Japan), K.Fukamichi, T.Kaneko, T.Masumoto. *Phys. Lett. A (Netherlands)*, vol.97A, no.5, p.213-16 (29 Aug. 1983).
The effect of pressure on the electrical resistance of $Fe_{90}Zr_{10}$ and $(Fe_{0.96}Ni_{0.04})_{90}Zr_{10}$ amorphous alloys has been investigated. The minimum point in the electrical resistance versus temperature curve shifts toward lower temperature range with increasing hydrostatic pressure, corresponding to the shift of the Curie temperature. The decrement of the electrical resistance below the Curie temperature T_c is about twice that above T_c , suggesting a large compressibility in the ferromagnetic state of the amorphous Invar alloys. (28 refs.)

114510 The electrical resistivity of GP zones. Temperature dependence. A.J.Hillel (Dept. of Theoretical Phys., Manchester Univ., Manchester, England). *Philos. Mag. B (GB)*, vol.48, no.3, p.237-43 (Sept. 1983).
The influence of the measuring temperature on the resistivity of GP zone-forming alloys is investigated theoretically in the light of recent measurements. The current theory explains the observations satisfactorily: for spherical clusters the measuring temperature has little influence on the resistivity, while for platelets, an increase in measuring temperature leads to a substantially higher peak resistivity occurring at a later ageing time. It remains slightly mysterious that the measuring temperature has absolutely no detectable influence in the case of Al-Zn. (17 refs.)

114511 Isothermal recovery of electrical resistivity in aluminum immediately after deformation. O.Haruyama, H.Yamaguchi, S.Yoshida (Dept. of Phys., Sci. Univ. of Tokyo, Tokyo, Japan).
Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.740-2
Isothermal recovery curves of the electrical resistivity of deformed aluminum (99.995 at.% purity) were measured immediately after the elongation, 4, 7, 13%. Peaks indicating a reverse recovery of resistivity were observed at adequate aging temperatures except for the specimen elongated about 4%. These reverse recoveries were interpreted from the dissociation of small vacancy clusters formed during the elongation. (5 refs.)

114512 Change in structure of chromel-alumel thermoelectric transducers used in a medium of natural gas. R.V.Druk, V.S.Frenchko, B.I.Gil', V.I.Lakh, I.E.Lopatinskii (Thermal Instrument Sci. & Production Union, Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.6, p.536-7 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.85-6 (Nov.-Dec. 1982). Investigations were made of the structure of the thermoelectric properties of 1.2-mm-diameter thermoelectrodes of Chromel (9.8 Cr, 0.10 Si, 0.02 Mn, 0.63 Co, 0.15 Fe, 0.07 C, and 0.12 Mg) and Alumel (1.24 Si, 1.95 Al, 2.10 Mn, 0.80 Co, 0.05 Fe, 0.01 C, and 0.07 Mg) in service at 800°C for 10, 3000, 6500, and 10000 h in natural gas. The basic component of the gaseous medium was methane with small amounts of impurities of oxygen, nitrogen, and carbon dioxide. The thermoelectric transducers were used in sheaths of Kh25T steel but there was not full protection from penetration of the gaseous medium. The processes occurring close to the surface and in the depth of thermal electrodes were studied by X-ray, optical, and spectral methods and by metallographic analysis. (3 refs.)

114513 Electrically conductive thermoplastic elastomer/polyacetylene blends. K.I.Lee, H.Jopson (Fundamental Res. Lab., GTE Labs. Inc., Waltham, MA, USA). *Polym. Bull. (Germany)*, vol.10, no.1-2, p.105-8 (June 1983). Three different types of thermoplastic elastomers, styrene-butadiene-styrene, styrene-isoprene-styrene, and styrene-ethylenebutylene-styrene triblock copolymers have been blended with polyacetylene utilizing various blending techniques. In one method, acetylene gas was polymerized with the Ziegler-Natta catalyst in the presence of either the thermoplastic elastomer film or a hydrocarbon solution of the thermoplastic elastomer. The resulting polyacetylene/thermoplastic elastomer blend has been characterized with infrared spectroscopy, X-ray diffraction and electron microscopy. Upon doping with either iodine or ferric chloride, the ultimate conductivities of the blends were found to be 60-100 Ω⁻¹. (5 refs.)

114514 Nonlinear and frequency-dependent transport phenomena in low-dimensional conductors. G.Gruner (Dept. of Phys., Univ. of California, Los Angeles, CA, USA). *Physica D (Netherlands)*, vol.8D, no.1-2, p.1-34 (July 1983). Nonlinear and frequency-dependent electrical conductivity is more a rule than an exception in materials with highly anisotropic electronic structure. Disorder leads to localization of the electronic wave functions, and the temperature-(T), electric field-(E), and frequency (ω)-dependent transport are due to random transfer rates between localized single particle states, a process fundamentally different from band transport. Interactions lead to collective modes, represented by a periodic modulation of the charge or spin density. The charge density wave (CDW) mode is pinned by impurities, but for small pinning forces it can be depinned by moderate electric fields, leading to nonlinear conductivity due to a sliding CDW. Both classical and quantum models account for the field and frequency dependent response; they also describe current oscillation phenomena and effects which arise when both DC and AC excitations are applied. For strong pinning the collective mode cannot be depinned at small electric field strengths, but nonlinear (soliton) excitations of the collective modes may be responsible for the nonlinear conductivity observed. In all these cases field- and frequency-dependent transport is strongly related. This feature is reproduced by various models, and therefore a detailed study of σ(T,E,ω) is called for to distinguish between the various sources of novel transport phenomena in these new types of solids. (98 refs.)

114515 Polyacetylene: A perspective in scientific and technological research of condensed matter physics. M.Apostol (Sectia Fizica Fundamentala, Inst. de Fizica si Inginerie Nucleara, Bucuresti, Rumania). *Stud. & Cercet. Fiz. (Rumania)*, vol.35, no.8, p.681-9 (1983). In Rumanian. Physical and chemical properties of polyacetylene (trans isomer) are briefly reviewed. Soliton theory of the electron-phonon coupling in polyacetylene is discussed. The possible practical applications of this material are emphasized. (7 refs.)

114516 Macroscopic coherence length of charge-density waves in orthorhombic TaS₃. G.Mihaly, G.Hutiray, L.Mihaly. *Report KFKI-1983-52*, Hungarian Acad. Sci., Budapest (1983), 15 pp. Four probe continuous and pulsed DC current-voltage measurements on orthorhombic TaS₃ showed that the distance between potential contacts influences (i) the sharpness of the metal-semiconductor transition at 222K and (ii) the threshold potential at which, in the low temperature phase, nonlinearity sets in. The closeness of voltage contacts on the 100 μm scale smears out the phase transition and increases the threshold field indicating that the coherence of CDW states is destroyed by the perturbation of contacts. 114517 Electron-deformation currents in metals. V.B.Fiks (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1077-9 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1864-9 (Nov. 1982). [received: Sept. 1983]

It is shown that a defect flux in a metal gives rise to an electron-deformation (ED) current. Since deformations give rise to dislocation fluxes, the metal deformations cause electron currents. The ED currents are proportional to the deformation rate $\dot{\epsilon}$ and increase with decreasing temperature like T⁻⁵ in the isotropic model of the metal. Below the superconducting-transition point the ED currents are proportional to the density of the normal electrons and are equal to zero in a superconducting metal. (9 refs.)

114518 Estimation of alloy scattering potential in ternaries from the study of two-dimensional electron transport. P.K.Basu, B.R.Nag (Inst. of Radio Phys. & Electronics, Calcutta, India). *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.689-91 (1 Oct. 1983). A theory of alloy scattering of a two-dimensional electron gas in ternary semiconductors is developed by assuming a spherically symmetric square potential, randomly distributed between two kinds of alloy sites. The theory predicts a temperature independent mobility, in agreement with the experimental results for In_{0.53}Ga_{0.47}As. The calculated value at 4.2K comes close to the experimental value, in which the effect of impurity scattering has been reduced by using an undoped spacer layer. It is concluded that the study of two-dimensional transport in the devices may lead to a correct estimation of the alloy scattering potential. (16 refs.)

114519 Polar, intervalley and acoustic scatterings in III-V group semiconductors. Application to GaAs and InSb. N.A.Saleh, K.S.Dubey (Dept. of Phys., Coll. of Sci., Univ. of Basrah, Basrah, Iraq). *Iraqi J. Sci.*, vol.22, no.4, p.520-43 (1981). [received: Aug. 1983]

Polar, intervalley and acoustic scattering have been studied in III-V group semiconductors by studying the variation of the polar, intervalley and acoustic scattering relaxation rates with temperature in the entire temperature range 50-500K for GaAs and InSb. The variations of these scattering relaxation rates with the effective mass m* as well as with the energy E have also been studied at a constant temperature T=300K for both semiconductors GaAs and InSb. The percentage contributions due to absorption and emission towards the total scattering relaxation rates due to polar and intervalley scatterings have been studied. (16 refs.)

114520 Electronic transport in tetrahedral amorphous semiconductors. P.Thomas (Fachbereich Phys., Univ. Marburg, Marburg, Germany). *Acta Polytech. Scand. Electr. Eng. Ser. (Finland)*, no.EL50, p.279-364 (1983). (Proceedings of Helsinki International Summer School on Semiconductors 1982, Espoo, Finland, 14-18 June 1982).

Present knowledge about the atomic structure of amorphous tetrahedrally-bonded semiconductors is briefly reviewed. A presentation of typical transport data is given, mainly for amorphous silicon. Current theoretical concepts are discussed and it is shown how they are used to formulate transport theories. The calculation of transport coefficients is demonstrated, and typical results are discussed in order to understand the transport properties of amorphous semiconductors. It is shown that a number of quite generally observed transport properties still remain unexplained. (92 refs.)

114521 Preparation and investigations of polycrystalline samples of copper sulphides Cu_{2-x}S (0≤x≤0.2). S.V.Pakeva, Z.S.Begova, V.P.Krusev, S.K.Plachkova (Faculty of Phys., Univ. of Sofia, Sofia, Bulgaria). *Bulg. J. Phys. (Bulgaria)*, vol.10, no.3, p.322-7 (1983). The structural and electrical properties of polycrystalline samples of copper sulphides Cu_{2-x}S (0≤x≤0.2) are studied. The samples have been prepared by direct synthesis of copper and sulphur taken in a ratio corresponding to the stoichiometric composition Cu₂S. Depending on the conditions of additional thermal treatment, two types of polycrystalline samples, with quite different physico-chemical properties, are obtained. One type of the samples consists mainly of orthorhombic Cu₂S; they are of low resistivity with specific conductivity σ of about 20 Ω⁻¹ cm⁻¹. The other type of samples consists mainly of tetragonal Cu_{1.96}S₁; they have three orders of magnitude lower conductivity σ~10⁻² Ω⁻¹ cm⁻¹. The last samples show photoconductivity at temperatures lower than 100K. (20 refs.)

114522 Electrical properties of ZnSe. S.Satoh, M.Isshiki, K.Igaki (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.7, p.1167-9 (July 1983). The electrical conductivity and electron concentration were measured as a function of deviation from stoichiometry in high-purity undoped and Cl-doped ZnSe single crystals. The In and Cl concentrations in high-purity undoped ZnSe were estimated using activation analysis. It was determined that the shallow donors are due to native defects. (12 refs.)

114523 Thickness dependence of electrical resistivity of vacuum-deposited selenium films. A.K.Sharma, B.Singh (Vacuum Tubes Div., Central Electronics Engng. Res. Inst., Pilani, India).

Indian J. Pure & Appl. Phys., vol.21, no.7, p.420-1 (July 1983).

Thickness dependence of electrical resistivity of vacuum deposited selenium films (thickness, 500 to 4420 Å) has been reported in vacuum, after an annealing cycle (30 to 150°C and back) and in residual vacuum after 24 hr. Unusual increase of electrical resistivity from 500 to 3400 Å thickness has been explained in terms of localized surface states. (9 refs.)

114524 Effect of gallium selenide on some physical characteristics of germanium selenide. M.A.Aliidzhanov, G.B.Abdullaev, K.O.Dovletov (S. Agamaliogla Azerbaizhdan Agricultural Inst., Azerbaizhdan SSR).

Inorg. Mater. (USA), vol.18, no.9, p.1359-60 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1586-7 (Sept. 1982). [received: Sept. 1983]

Some physical characteristics of solid solutions based on GeSe were investigated. The limiting mole fraction of GaSe dissolved in GeSe corresponds to the formula $\text{Ge}_{1-x}\text{Ga}_x\text{Se}$ (where $x \leq 0.05$). It has been supposed that solid solutions based on germanium selenide, in which the germanium is directly substituted by gallium, are formed. From the curves for the dependence of the electrical conductivity σ on the composition at 300K it is seen that with increase in the GaSe content of the germanium selenide up to 1 mole % the σ value first increases and then decreases a little. On the basis of the results from measurement of the Hall effect the authors calculated the mobility and concentration of current carriers, which varies significantly with increase in the GaSe content of the GeSe. The variation of the concentration p and mobility μ of the current carriers and the electrical conductivity, which is directly related to p and μ , accordingly as a function of the composition may be due to the large difference of the current carrier concentrations in the initial components. (8 refs.)

114525 Calculation and measurement of the effect of pressure on charge carrier transport in naphthalene. M.El Hamamsy, A.C.Damask (Queens Coll. of the City, Univ. of New York, Flushing, NY, USA), S.A.Elnahwy.

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.209-35 (1983). Intermolecular transfer integrals, including exchange and vibrational effects, for an excess electron and an excess hole in a naphthalene crystal are calculated as functions of pressure using the linear compressibilities. These integrals are then used to calculate the pressure dependence of the band structure, the drift mobility components and the Hall mobility. A novel design of a nonmagnetic high pressure cell with optical windows is described. Hall mobility of an excess hole was measured at high pressure by a photoinjection technique. The results of the calculations give a good agreement with available drift mobility data and with the Hall mobility measured in this work. Comparison between the calculated and observed mobilities shows that the constant mean-free-path approximation is superior to the constant-relaxation-time approximation for naphthalene. (31 refs.)

114526 Influence of additions on the electrical insulation properties of fused periclase. V.A.Bron, I.S.Raeva, L.P.Kostromina, A.S.Kondrashova, V.G.Sivash, A.D.Khomutina, E.A.Egorov (Eastern Refractory Inst., USSR).

Refractories (USA), vol.23, no.11-12, p.621-4 (Nov.-Dec. 1982). Translation of: *Ogneupory (USSR)*, vol.23, no.12, p.45-9 (Dec. 1982). Investigations were carried out into the influence of additions containing primarily SiO_2 , Al_2O_3 , and MgO on the electrophysical properties of periclase. The additions in the form of dispersed powders were made to the periclase after melting and pulverizing, and the mixtures were carefully mixed. Determinations of the specific electrical resistance of the periclase with additions showed that their use significantly increased the electrical resistance of the material. The possibility of strengthening the action of additions by heat treatment of them was investigated. (3 refs.)

114527 Numerical analysis of the sheet resistance of ion-implanted phosphorus layers in silicon. R.F.Schmucker, L.M.Scarfone (Univ. of Vermont, Burlington, VT, USA).

Solid-State Electron. (GB), vol.26, no.9, p.923-5 (Sept. 1983).

The authors present improved values of the sheet resistance at 300K resulting from the use of a more accurate treatment of electron conductivity mobility at both nondegenerate and degenerate doping levels. A comparison between the present calculation of sheet resistance and that obtained from various empirical mobility formulas, the Smith and Stephen curves (1972), and experimental data is shown. (9 refs.)

114528 AC conductivity in AsF_5 doped polyphenylacetylene (PPA). A.P.Bhatt, W.A.Anderson, P.Ehrlich (State Univ. of New York, Amherst, NY, USA).

Solid State Commun. (USA), vol.47, no.12, p.997-9 (Sept. 1983).

The AC conductivity of semiconducting cis-cisoid polyphenylacetylene (PPA) pellets has been studied at temperatures between 230 and 290K and frequencies, f , from 37 to 10^5 Hz. The AC conductivity (σ_{ac}) is found to be strongly temperature dependent. σ_{ac} is proportional to f^s with s varying from 0.45 to 0.75 as the temperature is raised from 230 to 290K. Both frequency dispersion and strong temperature dependence of σ_{ac} are best explained by the mechanism of hopping conduction in the band-tails. (no refs.)

114529 Electrical conductivity of Cr_2O_3 doped with La_2O_3 , Y_2O_3 and NiO. H.Nagai (Dept. of Materials Sci. & Engng., Faculty of Engng., Osaka Univ., Yamada-oka, Suita, Osaka, Japan), T.Fujikawa, K.Shoji.

Trans. Jpn. Inst. Met. (Japan), vol.24, no.8, p.581-8 (Aug. 1983). In order to obtain a better fundamental understanding of factors responsible for an excellent improving effect of rare earths addition on the high temperature oxidation resistance of Ni-Cr alloys, the electrical conductivities of sintered Cr_2O_3 doped with various amounts of La_2O_3 , Y_2O_3 and NiO were measured in the temperature range from 773 to 1473K at near atmospheric oxygen pressures. The electrical conductivities of Cr_2O_3 doped with La_2O_3 and Y_2O_3 up to 0.5 mass% gradually increased. The increase in the electrical conductivity by the addition of La_2O_3 was larger than that caused by the addition of Y_2O_3 . The electrical conductivities of Cr_2O_3 undoped and doped with La_2O_3 and Y_2O_3 decreased with decreasing partial pressure of oxygen. This result showed that they were p-type semiconductors under the conditions investigated. The pressure dependence of the electrical conductivity of Cr_2O_3 slightly changed with the addition of La_2O_3 and Y_2O_3 . The electrical conductivity of Cr_2O_3 markedly increased with increasing NiO content up to 1 mass%. In contrast, the temperature and pressure dependence of the electrical conductivity of Cr_2O_3 doped with NiO abruptly changed with the addition of more than 0.2 mass%. The electrical conductivity of Cr_2O_3 doped with NiO more than 0.2% was independent of the partial pressure of oxygen at all temperatures investigated. Both the magnitude and the temperature and pressure dependence of the electrical conductivities of Cr_2O_3 -1%NiO-1% R_2O_3 (R:La and Y) were very close to those of Cr_2O_3 -1%NiO. This result suggested that there was little interaction between NiO and R_2O_3 in Cr_2O_3 . (11 refs.)

114530 Conduction in polycrystalline silicon: generalized thermionic emission-diffusion theory and extended state mobility model. A.N.Khondker (Electrical Engng. Dept., Rice Univ., Houston, TX, USA), D.M.Kim, R.R.Shah.

Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.431-6. The authors present a general theory of conduction in polysilicon. The theoretical framework reconciles two apparently divergent approaches for modeling conduction processes in polysilicon and provides a physical basis to correctly interpret and to point out the deficiencies of previously reported thermionic and thermionic field emission theory. This model is based on an extended state mobility in the disordered grain boundary and the thermionic emission-diffusion theory for conduction of current. The attractive features of the theory are (a) it can explain the experimental data without the use of an artificial factor, f, (b) the conduction process is characterized explicitly by the inherent material properties of the grain and the grain boundary. The model is particularly suited for describing the electrical properties of laser restructured polysilicon, where, because of large grain size, the diffusion process is expected to be dominant. 72.20H High-field and nonlinear effects

114531 Hot carrier physics and higher order electron phonon dynamics.

P.Kocevar (Univ. Graz, Graz, Austria). *Acta Polytech. Scand. Electr. Eng. Ser. (Finland)*, no.EL50, p.102-38 (1983). (Proceedings of Helsinki International Summer School on Semiconductors 1982, Espoo, Finland, 14-18 June 1982).

The performance of most semiconductor devices is strongly influenced by nonohmic effects due to the high electric fields inside the individual device components. Such 'hot electron' phenomena limit the speed, power and lifetime of the device by determining ultimate drift- and diffusion-velocities, generation- and recombination rates of carriers, Joule heating and thermal as well as dielectric breakdown. The use of nonohmic transport as a spectroscopic tool has brought many new insights into the electronic structure of semiconductors. Finally, some recent results are presented on higher order electron-phonon dynamics obtained from high field research. (25 refs.)

114532 Linear coefficients of equation of motion of a drift electron. T.K.Ishii (Dept. of Electrical Engng. & Computer Sci., Marquette Univ., Milwaukee, WI, USA).

Proc. IEEE (USA), vol.71, no.8, p.1010-12 (Aug. 1983).

A simple method of calculating the friction coefficient and the restraining coefficient of a linear equation of motion of a drift electron in an isotropic medium is presented. This new method is applied for an electron in the high-field domain in a magnetically biased Gunn diode as an example. (6 refs.)

72.20J Charge carriers: generation, recombination, lifetime, and trapping

114533 Effects of doping on transport and deep trapping in hydrogenated amorphous silicon. R.A.Street, J.Zesch, M.J.Thompson (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).

Appl. Phys. Lett. (USA), vol.43, no.7, p.672-4 (1 Oct. 1983).

The authors report a quantitative comparison of the trapping rates of carriers at charged and neutral dangling bonds in hydrogenated amorphous silicon (a-Si:H). The data are obtained from time-of-flight photoconductivity studies of doped and undoped samples. The temperature dependence of the trapping rates, as well as the effect of boron doping on the hole drift mobility, is also reported. (11 refs.)

- 114534 Thermally stimulated current studies on cadmium selenide single crystals heat-treated in selenium vapour.** D.Raja Reddy, P.Chandrasekharam, B.Krishnamma (Dept. of Phys., SV Univ., Tirupati, India). *Indian J. Phys. Part A*, vol.57A, no.3, p.170-4 (May 1983). Thermally stimulated current (TSC) measurements were made on vapour phase-grown CdSe single crystals heat-treated in selenium vapour to make them photosensitive. Two TSC peaks were observed near 110K, and 180K. These peaks correspond to two electron trap levels at 0.14 eV and 0.28 eV, respectively, below the bottom of the conduction band. The cross-sections of the traps for electron capture, and the attempt-to-escape frequency for electrons in traps have been calculated. These crystals did not show any photochemical effects. (15 refs.)
- 114535 Detection of minority traps by simultaneous measurement of thermoluminescence and thermally stimulated conductivity.** V.K.Mathur, M.D.Brown (Naval Surface Weapons Center, Silver Spring, MD, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.5485-7 (Sept. 1983). Generally, thermoluminescence (TL) and thermally stimulated conductivity (TSC) measurements are carried out to detect majority traps. It is pointed out in this communication that a careful analysis of the ratio $R(=\sigma_{TSC}/I_{TL})$ and I_{TL} , where σ_{TSC} is the thermally stimulated conductivity and I_{TL} is the intensity of thermoluminescence, has the potential of revealing information about the hole emission and hole traps. These two cases can be differentiated by comparing the initial rise of the temperature derivative of $1/R$, i.e. $(d/dT)(1/R)$ and I_{TL} . It is also possible to estimate the activation energy of shallow hole traps. (8 refs.)
- 114536 Correlation of lifetime with recombination centers in electron-irradiated P-type silicon.** B.J.Baliga, A.O.Ewvaraye (General Electric Co., Corporate Res. & Dev. Center, Schenectady, NY, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.9, p.1916-18 (Sept. 1983). Four majority carrier trap levels have been observed in p-type (boron-doped) silicon after 1.5 MeV electron irradiation. By correlation of the annealing rate of the minority carrier recombination lifetime with the concentration of these levels, it has been found that the divacancy-induced level at $(E_v+0.23$ eV) controls the lifetime. Since this level begins to anneal out only at temperatures above 300°C, it can be concluded that electron irradiation of p-base silicon devices can be used to control their switching speed. (7 refs.)
- 114537 Existence of a distribution of hole-trap activation energies in FEP-Teflon.** J.Hagekyriakou, R.J.Fleming (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.9, p.1691-701 (Sept. 1983). When FEP-Teflon samples are electron irradiated at room temperature in open circuit and stored in that state for varying times following the end of irradiation, the temperature of the first current peak of the short-circuit TSC plot increases with increasing storage time. A new model is presented to explain this phenomenon, its main features being (i) a quasicontinuous distribution of hole-trap activation energies, the 'center of mass' of the trapped hole population moving toward the deeper end of the distribution during the storage time, and (ii) an electron/hole recombination coefficient much smaller than that implied in an earlier model. It is shown that the assumption of a single dominant type of hole trap implies an unrealistically large frequency factor. (27 refs.)
- 114538 Charge carrier trapping states in tetracene and pentacene crystals.** I.Ya.Muzikante, A.Yu.Rampans, E.A.Silin'sh, L.F.Taure. *Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.18-27 (1983). In Russian. Charge carrier trapping states have been studied in oriented vacuum evaporated layers of tetracene (Tc) and pentacene (Pc) by space-charge-limited currents (SCLC) and thermally stimulated current (TSC) techniques. Several sets of trapping states of Gaussian distribution have been observed in the energy gap of Tc and Pc layers: the shallow set of hole traps with distribution maximum at $E_t=0.08$ to 0.10 eV above the hole conductivity level and several sets of hole traps in the energy intervals from $E_t=0.2$ to $E_t=0.5$ eV both for Tc and Pc, as well as deep electron trapping states at $E_t=0.68$ eV for Pc and $E_t=0.72$ eV and 1.0 eV for Tc. The total trap density N_t and dispersion parameter σ have been determined for all the above mentioned sets of trapping states; trapping cross-sections for several sets of trapping states have also been estimated. (16 refs.)
- 114539 Thermally stimulated current transport peak in a system with spatially disordered hopping sites.** J.Plans, F.J.Balta Calleja (Instituto de Estructura de la Materia, CSIC, Madrid, Spain), M.Zielinski, M.Kryszewski. *Philos. Mag. B (GB)*, vol.48, no.3, p.289-96 (Sept. 1983). The continuous-time random-walk model used by Seher and Montroll (1975) to account for the dispersive transport phenomena observed in time-of-flight experiments on amorphous solids is extended to the non-isothermal case of thermally stimulated currents (TSCs). The basic implications of the theory of a TSC transport peak resulting from a system with random distribution of iso-energetic hopping sites are presented. (12 refs.)
- 114540 Silicon-wafer process evaluation using minority-carrier diffusion-length measurement by the SPV method.** A.M.Goodman, L.A.Goodman, H.F.Gossenberger (RCA Labs., Princeton, NJ, USA). *RCA Rev. (USA)*, vol.44, no.2, p.326-41 (June 1983). Measurement of the minority-carrier diffusion length L by the constant-magnitude steady-state surface photovoltage (SPV) method has become an important tool within RCA for evaluating the effect (on L) of silicon device fabrication steps. The authors present first a simplified description of the method and the practical information required for implementing this measurement technique. Substrate selection, sample preparation, data evaluation, and the limitations of the method are discussed in detail. Next, they describe the use of the SPV technique to monitor the unintentional introduction of heavy metal impurities at five different steps during wafer processing. The beneficial effect of adding 1-1-1 trichloroethane (TCA) to a furnace ambient is assessed by using the SPV technique and also by counting the number of crystalline defects delineated with Wright etch. (18 refs.)
- 114541 Surface recombination statistics at traps.** P.T.Landsberg, M.S.Abrahams (Dept. of Math., Univ. of Southampton, Southampton, England). *Solid-State Electron. (GB)*, vol.26, no.9, p.841-9 (Sept. 1983). The Shockley-Read-Hall recombination statistics were recently generalised by Dhariwal, Kothari and Jain (1981) to include the effect of a finite time of relaxation before the captured carrier settles into its ground state, and by Landsberg (1982) to allow for Auger effects and so-called 'extra' carriers supplied to the semiconductor from the outside. The combined result of these effects is studied here theoretically, together with the consideration of a simple distribution of trap states. It is found that the surface recombination velocity s has the usual minimum in the near intrinsic state and that s passes through a maximum as a function of excess electron concentration. Both extrema are enhanced if the trap states are distributed over an energy range. Experimental plots of s as a function of excess electron and hole concentra-

tions should yield insight concerning the numerical importance of (a) Auger effects with the participation of traps and (b) relaxation times. (18 refs.)

- 114542 Carrier drift time from pulsed photoconductivity in as-grown trans-polyacetylene.** Y.Yacoby, S.Roth, K.Menke, F.Keilmann, J.Kuhl (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany). *Solid State Commun. (USA)*, vol.47, no.11, p.869-71 (Sept. 1983). Nanosecond pulsed photoconductivity experiments in as-grown trans-polyacetylene at room temperature are reported. From the decay of the photoresponse the free drift time of photogenerated carriers is found to be $\tau_{fd}<10^{-9}$ sec. From the amount of collected charge the upper limit of τ_{fd} is reduced to picoseconds so that the relaxation of electrons and holes into mobile solitons and anti-solitons in questionable. (19 refs.)
- 114543 Auger recombination in a degenerate electron-hole plasma in InGaAsP solid solutions.** B.L.Gel'mont, Z.N.Sokolova, V.B.Khalfin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.280-3 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.453-8 (March 1983). [received: Sept. 1983] Calculations are made of the Auger recombination rate for an electron-hole plasma in a semiconductor with the zinc-blende structure in the case of nondegenerate holes and an arbitrary degree of degeneracy of electrons. Semiconductors in which the band gap is greater than the spin-orbit splitting are considered and it is found that the most probable process is the Auger recombination with a transition of a heavy hole to a spin-orbit split-off band. Calculated temperature and carrier-density dependences of the nonradiative recombination times are reported for InGaAsP solid solutions. The dependences of the internal quantum efficiency of the luminescence on the current are deduced allowing for the Auger process under consideration and also for the Auger recombination accompanied by the transfer of energy to an electron (the latter process is important at high nonequilibrium carrier densities). (14 refs.)
- 114544 Influence of the anisotropy of the elastic electron-phonon scattering on the carrier mobility in tellurium.** N.Ya.Kushnir, N.P.Gavaleshko, P.N.Gorlei (State Univ., Chernovtsy, Ukrainian SSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.321-2 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.513-15 (March 1983). [received: Sept. 1983] In view of the considerable mathematical difficulties arising from the complex nature of the collision integrals, many theoreticians simplify the real phonon spectrum of low-symmetry crystals by averaging this spectrum in a certain manner. However, it has not yet been determined how such a simplification affects, for example, the electron-phonon coupling constants found by comparing the theory with experiment. The authors establish the effects of such simplification in the case of group D_3 crystals that do not include inversion as one of the symmetry elements. (7 refs.)
- 114545 Photon transfer of nonequilibrium carriers in a variable-gap semiconductor at right-angles to the band gap gradient.** A.S.Volkov, A.L.Lipko (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.322-2 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.515-17 (March 1983). [received: Sept. 1983] The authors show that under the conditions of the photon drift of nonequilibrium carriers in a variable-gap semiconductor subjected to an inhomogeneous excitation of the wide-gap surface one can expect photon-transfer-induced diffusion fluxes of nonequilibrium carriers in a plane perpendicular to ∇E_g , and these fluxes transfer nonequilibrium carriers over distances much greater than the displacement length of these carriers in the direction of decreasing band gap. (8 refs.)
- 114546 Mechanism of carrier scattering in $Ag_3In_2Se_9$.** V.I.Tagirov, A.G.Guseinov, N.F.Gakhramanov, F.M.Aliev (S.M. Kirov Azerbaidzhan State Univ., Baku, Azerbaidzhan SSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.329 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.524-5 (March 1983). [received: Sept. 1983] The authors report the results of an investigation of the current-voltage characteristics, Hall coefficient, and saturation of the current in $Ag_3In_2Se_9$, which is a member of a new class of materials with the general formula $A_3B_5C_9$. (7 refs.)
- 114547 Physical properties and functional possibilities for silicon structures compensated with zinc.** V.M.Arutyunyan (Erevan State Univ., Erevan, USSR). *Sov. Microelectron. (USA)*, vol.11, no.6, p.291-301 (Nov.-Dec. 1982). Translation of: *Mikroelektronika (USSR)*, vol.11, no.6, p.539-50 (Nov.-Dec. 1982). [received: Sept. 1983] It is known that the introduction of zinc into N type silicon substantially sensitizes it. The parameters of the centers (the energy position in the forbidden band, the charge state and type of the centers, and the electron and hole capture cross sections) have been thoroughly studied as well as the optical and photoelectric properties of Si<Zn>. The possibilities for creating functional microelectronic elements with Si<Zn> are based, in particular, on the comparatively high solid solubility and diffusivity (5×10^{16} cm $^{-3}$ at 1350°C and 10^{-6} - 10^{-7} cm 2 /s at 1000-1200°C, respectively) of electrically active zinc atoms in silicon, the stability of the energy arrangement of the zinc levels, the weak 'inclination' toward formation of a large number of complexes, the compatibility of the photosensitivity spectrum with the characteristics of semiconductor light-emitting diodes, and the large range of variation of the minority and majority carrier lifetimes (10^{-10} -0.01 s). (69 refs.)
- 114548 Effect of grain size on the resistivity of polycrystalline material.** D.P.Joshi, K.Sen (Dept. of Phys., Dayanand Brijendra Swaroop Coll., Dehra Dun, India). *Sol. Cells (Switzerland)*, vol.9, no.4, p.261-7 (Sept. 1983). The effects of grain size and doping concentration on the resistivity of polycrystalline silicon are investigated. A new relation is presented for the resistivity of large-grain polycrystalline material. Assuming localized states at the grain boundaries, the predicted variations in resistivity with grain size and doping concentration show reasonable agreement with the experimentally observed variations. Computations show that, as the grain size increases, the sensitivity of the resistivity of the polycrystalline material to the doping concentration decreases. For grain sizes less than 10 μ m, the resistivity is predominantly controlled by the average carrier concentration, while for grain sizes greater than 10 μ m the resistivity is mainly controlled by the effective mobility. (18 refs.)
- 114549 The electrical behavior of grain boundaries in silicon.** C.H.Seager (Sandia Nat. Labs., Albuquerque, NM, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.343-55. Despite the fact that lattice imaging studies have shown that grain boundaries in group IV semiconductors often have structures which are complicated and

inhomogeneous on the scale of tens-to-hundreds of angstroms, simple theories assuming uniform double depletion layers have recently been shown to successfully predict many of the majority carrier transport properties of these defects. On the other hand the knowledge of the interaction of grain boundaries with minority carriers is in a considerably more primitive state. The author describes recent attempts to understand the effects of illumination on grain boundary potential barrier heights and the influence of these defects on the optically generated minority carrier population. Quantifying this latter interaction is particularly important in estimating the performance of polycrystalline solar cells. Simple but elegant scanned excitation measurements for measuring s , the minority carrier recombination velocity at grain boundaries, will be reviewed. The author discusses recent measurements of s as a function of temperature and illumination intensity and shows how these data can be correlated with zero-bias impedance measurements. (43 refs.)

114550 Kinetic properties of chromium-doped lead telluride. L.D.Borisova, L.S.Parfenieva, L.V.Prokofeva, M.V.Romanova, I.A.Smirnov, T.T.Dedegkaev.

Bulg. J. Phys. (Bulgaria), vol.10, no.3, p.337-43 (1983). In Russian. The kinetic coefficients: electric conductivity (σ), thermoelectric power (α), thermal conductivity (κ) and Hall coefficient (R) of chromium-doped lead telluride samples have been studied. The samples have been prepared by powder metallurgy. Anomalous dependences of the kinetic coefficients (α , R) on the composition, current carrier concentration and temperature have been observed. The experimental results have been explained in terms of the presence of chromium impurity states in the PbTe conduction band. (4 refs.)

114551 Behaviour of large-grain polycrystalline n -InP grown by SSD technique. J.N.Roy, S.Basu, D.N.Bose (Materials Sci. Centre, Indian Inst. of Technol., Kharagpur, India), A.J.Singh.

Indian J. Pure & Appl. Phys., vol.21, no.7, p.395-7 (July 1983). Large-grain (2-3 mm) polycrystalline n -InP was prepared by synthesis solute diffusion (SSD) technique. The material thus prepared was fully characterized by X-ray, conductivity and Hall-effect measurements. Room temperature measurements showed carrier concentration $n_s = 3 \times 10^{23}/\text{m}^3$, resistivity $\rho = 3.46 \times 10^{-4}$ ohm-m and Hall mobility $= 6.91 \times 10^{-2}$ m²/V-sec. The grain-boundary scattering effect was determined taking compensation into account. Using electrochemical technique the band gap was measured as 1.28 eV. These results were compared with the standard sample obtained from Metals Research, UK. From the temperature variation of carrier concentration and conductivity the activation energies were determined. The conductivity activation energy (E_c) and the carrier activation energy (E_n) were 9.09×10^{-3} and 1.39×10^{-2} eV respectively. The temperature (T) dependence

of mobility (μ) was found to follow the relation $\mu \propto T^{-x}$ with $x=2.44$. The mobility at 160K was found to be 0.276 m²/V-sec. (9 refs.)

114552 Hall effect and sheet resistivity measurements at low temperatures on silicon implanted with iron. S.V.Joshi, M.C.Joshi (Dept. of Phys., Univ. of Bombay, Bombay, India).

Indian J. Cryog., vol.8, no.1, p.48-51 (1983). Iron ions were implanted in p -type silicon at room temperature at two different doses, 1×10^{17} ions/m² and 1×10^{19} ions/m², using an isotope separator. The implanted samples were annealed for $1/2$ hr at 400°C and 650°C. Hall effect and sheet resistivity measurements were made on these annealed samples in the temperature range 100K-300K. The sample implanted at dose 1×10^{19} ions/m² and annealed at 400°C for $1/2$ hr was p -type just after annealing and, after keeping it at room temperature for about one month, it became n -type. Sheet resistivity measurements were made on this sample after conversion and the plot of $\log \rho$ vs. $1/T$ was not linear. The sample implanted at dose 1×10^{17} ions/m² and annealed at 650°C for $1/2$ hr did not show any conversion. For this sample, the plot $\log \rho$ vs. $1/T$ was linear. The nonlinear plot for the first sample suggested that the radiation damage was not completely annealed and the linear plot for the second sample showed that the damage was almost removed. (11 refs.)

114553 Magnetoresistance of germanium in the range of hopping conduction with a variable jump length. I.S.Shlimak, A.N.Ionov, B.I.Shklovskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.314-15 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.503-6 (March 1983). [received: Sept. 1983]

The authors measured the electrical conductivity and magnetoresistance of heavily doped and compensated Ge. The concentration of phosphorus, representing the main donor impurity, was $N_D = 5 \times 10^{18} \text{ cm}^{-3}$; the compensating acceptor impurity was gallium and the degree of compensation was $K=0.8$ to 0.9. (8 refs.)

114554 Influence of an electric field on the anomalous magnetoresistance of n -type $\text{Al}_x\text{Ga}_{1-x}\text{As}$. K.Durshimbetov, A.F.Kravchenko, A.M.Palkin (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.341-2 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.542-4 (March 1983). [received: Sept. 1983]

An anomalous negative magnetoresistance of n -type $\text{Al}_x\text{Ga}_{1-x}\text{As}$ has been observed in a wide range of impurity concentrations, compositions, and temperatures. The authors found this anomalous magnetoresistance to be highly sensitive to an applied electric field. They investigated this sensitivity at 4.2K. The electron density in the samples was within the range 10^{16} - 10^{17} cm^{-3} at 300K. All samples exhibited quasimetallic impurity-band conduction at temperatures below 50K. A graph shows typical dependences of the anomalous negative magnetoresistance on a longitudinal electric field, determined at fixed values of T and H . This negative magnetoresistance decreases strongly at a rate which depends on the magnetic field. In high fields H the negative magnetoresistance decreases more rapidly on increase in the magnetic field and becomes positive at low values of E . An investigation of the Hall coefficient and electrical conductivity showed that the reduction in the negative magnetoresistance on increase in the electric field is due to a change in the electron mobility and not in the electron density. (6 refs.)

114555 Experimental observation of decreased Hall mobility of conduction electrons in ZnSe with moving dislocations. A.V.Zaretskii, V.F.Petrenko (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.300-4 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.532-40 (Feb. 1983). [received: Sept. 1983]

It has been experimentally observed that the motion of dislocations already existing in ZnSe crystals decreases the Hall mobility and increases the concentration of conduction electrons. The authors describe the results of an experimental study of these phenomena and discuss their possible mechanism. The decrease in the Hall mobility is evidently due to a significant amount of scattering of electrons by the Coulomb potential of strongly charged moving dislocations unscreened by point defects. The increase in concentration of conduction electrons is due to the emptying of electrons from point centers into the conduction band by strongly charged dislocations during the motion of the dislocations through the crystal. (27 refs.)

114556 Theory of magnetokinetic phenomena for small-radius scatterers in semiconductors. S.P.Andreev, S.V.Tkachenko (Moscow Engng. Phys. Inst., Moscow, USSR).

Sov. Phys.-JETP (USA), vol.83, no.5, p.1050-8 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1816-30 (Nov. 1982). [received: Sept. 1983]

The Schrodinger equation for an electron in the field of an attraction center of arbitrary depth and in a uniform magnetic field is solved under the assumption that the attraction-center effective radius a is small compared with the magnetic length $l = (\hbar/|e|H)^{1/2}$. The spectra of the bound and quasibound states are obtained and their dependence on the depth of the potential center U is studied in detail. The width and the real part of the energy of the quasibound state in the higher Landau bands $N \neq 0$ is investigated at arbitrary values of U . A system of wave equations is constructed for the bound and quasibound states, as well as the wave functions of the continuous spectrum. On the basis of these functions it is possible to calculate any semiconductor kinetic coefficient due to interaction of the carriers with small-radius centers in a quantizing magnetic field. The transverse and longitudinal static conductivities of a carrier gas scattered by such centers in a quantizing magnetic field are calculated. Expressions for them are obtained in general form in terms of the operators for scattering by a center in an axisymmetric gauge at an arbitrary depth of the scatterer potential. Oscillations of the transverse and longitudinal conductivities with changing depth of the potential of the center are observed. It is shown that the dependences of the conductivity on the temperature and on the field are governed essentially by depth of the scatterer potential, i.e. by the type of impurity in the semiconductor. 72.30 HIGH-FREQUENCY EFFECTS; PLASMA EFFECTS

- 114557 Pinch effect in a narrow-gap semiconductor with advanced interband breakdown. A.V.Dmitriev, L.S.Fleishman (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.234-8 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.416-22 (Feb. 1983). [received: Sept. 1983]

The pinch effect is considered in an electron-hole plasma formed in a narrow-gap semiconductor of the $\text{Bi}_{1-x}\text{Sb}_x$ alloy type by interband breakdown in a strong electric field. Electron and hole scattering by acoustic phonons, lattice defects, and one another is taken into account. The calculations are based on the Boltzmann transport equation and the effective temperature approximation. The carrier distribution in the sample is found as a function of the electric field, together with the current-voltage characteristics of the sample. (17 refs.)

72.40 PHOTOCONDUCTION AND PHOTOVOLTAIC EFFECTS; PHOTODIELECTRIC EFFECTS

- 114558 Generation and detection of millimeter waves by picosecond photoconductivity. D.H.Auston, P.R.Smith (Bell Labs., Murray Hill, NJ, USA).

Appl. Phys. Lett. (USA), vol.43, no.7, p.631-3 (1 Oct. 1983). Picosecond photoconductors in the form of dielectric resonators have been used to generate and detect extremely short bursts of millimeter wave radiation at 55 GHz with a repetition rate of 100 MHz. Both the generator and detector are tuned to a frequency which is determined by the length of the photoconducting dielectric resonators. The detector, which is phase coherent, has an estimated noise equivalent power of only 4×10^{-11} W for an integration bandwidth of 1 Hz, and is capable of resolving time intervals corresponding to a small fraction of one millimeter-wave cycle. (8 refs.)

- 114559 Theory of generation-recombination noise and responsivity in overlap structure photoconductors. D.L.Smith (Honeywell Systems & Res. Center, Minneapolis, MN, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5441-8 (Sept. 1983). A rigorous theory of both responsivity and generation-recombination noise in overlap structure photoconductors is presented. Because generation-recombination noise dominates under typical operating conditions, these results combine to give the detectivity D^* . It is found that both responsivity and D^* can be improved by use of the overlap structure. The dependence of the optimum device geometry on the operating conditions, such as bias conditions, and on the parameter to be maximized (e.g. responsivity or D^*), is derived. Symmetric and asymmetric overlap structure are compared, and it is found that, except at very small bias fields, an asymmetric structure gives the largest improvement in both the responsivity and D^* . Both responsivity and noise voltage are found to roll off at lower frequencies for the overlap structure than for the standard design, but become equal to the standard design values at high frequencies. Numerical results for $x \approx 0.1$ HgCdTe detectors are presented. Using an asymmetrical overlap structure the theory predicts that, under usual operating conditions, the responsivity can be more than doubled and simultaneously D^* increased by over 15%. Under optimum conditions D^* for the overlap structure photoconductor can equal the usually quoted value of D_{BLIP}^* for a photovoltaic device; that is it can exceed the usually quoted value of D_{BLIP}^* for a photoconductor by as much as a factor of $\sqrt{2}$. (7 refs.)

- 114560 Influence of external conditions on oscillations of the photocurrent in CdSe single crystals. B.S.Vakarov, V.V.Serdyuk, I.A.Starostin (Sci.-Res. Inst. of Phys., I.I. Mechnikov State Univ., Odessa, Ukrainian SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.253-5 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.409-12 (March 1983). [received: Sept. 1983]

An investigation is made of the influence of the intensity of the exciting light and of the voltage applied to the electrodes of a sample on the frequency of oscillations of the photocurrent in cadmium selenide single crystals. It is assumed that these oscillations are due to the trapping of free carriers dependent on the electric field intensity and a transformation procedure is applied to a system of equations describing such a model using the parameters of trapping centers deduced from the time dependence of the current during the oscillations. The initial system of equations is reduced to the van der Pol equation and analytic expressions are obtained for the photoconductivity oscillation frequency. The experimentally observed dependences of the oscillation frequency on the rate of photoexcitation and on the voltage applied to the sample are found to agree with the corresponding dependences deduced from the proposed model of the effect. (6 refs.)

- 114561 Photoconductivity and determination of the fundamental parameters of uniaxial crystals (with specific example of CdGeP_2/Cu). Yu.V.Rud', V.E.Skoryukin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.263-5 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.426-30 (March 1983). [received: Sept. 1983]

A method is proposed for the determination of the fundamental parameters of a semiconductor from the photoconductivity spectra. The method is tested by applying it to CdGeP_2/Cu crystals. An analysis of the photoconductivity spectra is used to find the spectral dependences of the absorption coefficient throughout the photosensitivity range, as well as the values of the diffusion length ($\approx 0.9 \mu$), surface recombination velocity, hole lifetime ($\approx 5 \times 10^{-8}$

sec), and optical and photoelectric anisotropy coefficients. Certain relationships are derived and an analysis is made of the influence of the surface recombination velocity and of the thickness of a photoresistor on its polarization sensitivity. (5 refs.)

- 114562 Photoresponse of germanium p^+-p junctions. I.Ya.Marmur, Ya.A.Oksman, E.Yu.Perlin, A.V.Fedorov.

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.290-2 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.469-73 (March 1983). [received: Sept. 1983]

A photo-emf was observed at alloyed p^+-p contacts illuminated with CO_2 laser radiation. The fast-response component of this emf due to the 'heating' of the hole subsystem by laser radiation rapidly decreased on increase in temperature from 77 to 120-150K. The temperature dependence of the photo-emf was explained allowing for the influence of temperature on the height of a barrier separating regions of heavy and light doping, and also allowing for the rate of relaxation of photoholes. (13 refs.)

- 114563 Photostimulated formation of shallow donors in 'pure' CdS crystals. E.Vateva, B.Embergenov, N.E.Korsunskaya, I.V.Markevich, D.Nesheva (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.300-1 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.484-5 (March 1983). [received: Sept. 1983]

The authors find the reasons for the change in the photosensitivity by a comprehensive investigation of photo-electric properties and luminescence of platelet and bulk crystals in two states: before and after the occurrence of the photochemical reaction (states A and B, respectively). State A was produced by heating a sample to 450K and cooling it in darkness to 80 or 4.2K (measurement temperature). State B was obtained by heating to 400K and cooling during illumination to 300K. The subsequent cooling to 80 or 4.2K took place in darkness in order to avoid superposition of a low-temperature photochemical reaction which also occurred in these crystals. (3 refs.)

- 114564 Characteristics of the optical quenching of the photoconductivity of CdS single crystals irradiated with $E=10$ MeV electrons. G.E.Davidyuk, N.S.Bogdanyuk, A.P.Galushka (Lesia Ukrainka State Pedagogical Inst., Lutsk, Ukrainian SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.316-17 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.506-7 (March 1983). [received: Sept. 1983]

The author studied the characteristics of the optical quenching of the photoconductivity of undoped CdS single crystals irradiated with $E=10$ MeV electrons. The irradiation was carried out at room temperature. The radiation dose was $D \approx 4.10^{16}$ electrons/cm². (9 refs.)

- 114565 Mechanism of the photoconductivity of nickel-compensated gallium phosphide. M.S.Saidov, K.Abdirmov, A.S.Saidov, V.G.Makarenko (S.V. Starodubtsev Physicotech. Inst., Acad. of Sci., Tashkent, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.332 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.529-30 (March 1983). [received: Sept. 1983]

Considers a likely mechanism of the photosensitivity of GaP:Ni crystals. It has been shown that nickel can have three charge states in GaP: neutral $\text{Ni}^0(3d^8)$, with one electron $\text{Ni}^-(3d^8)$, and with two electrons $\text{Ni}^{2-}(3d^9)$, acting as a trap. The ESR spectra of $\text{Ni}^0(3d^8)$ consist of hyperfine structure lines with $g=2.089$ and the ionization energy of the Ni^- state is 0.5 eV. The ionization energy of this second state Ni^{2-} has not been determined accurately. The authors found the Ni^{2-} level more accurately and accounted for the observed photosensitivity by considering measurements of the optical absorption exhibited at 300K by GaP crystals with different nickel concentrations. (4 refs.)

- 114566 Photoconductivity of n -type germanium with 'repulsive' impurity centers at photon energies less than the thermal ionization energy. I.A.Kurova, N.N.Ormont (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.346-7 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.549-51 (March 1983). [received: Sept. 1983]

The authors have reported earlier (1981) that n -type Ge exhibits a low temperature photoconductivity when electrons are generated in the field of negatively charged impurity centers by photons of energies less than the thermal ionization energy of the impurity. It seemed desirable to carry out an investigation at higher temperatures in order to establish the nature of this photoconductivity. The authors report the results of a study carried out in the temperature range 40-150K on germanium samples with a partly compensated second acceptor level of gold ($E_1^+ = E_c - 0.2$ eV). (4 refs.)

- 114567 Optical and thermal transitions in bismuth silicate. V.I.Berezhkin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.276-9 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.490-4 (Feb. 1983). [received: Sept. 1983]

The paper reports the results of investigations of the optical and photoelectric properties of $\text{Bi}_{12}\text{SiO}_{20}$ in a broad range of temperatures. It is shown that the ratio of the energies of the optical and thermal transitions is equal to 3.1, so that the anomalies observed in the optical measurements in the 1-2 eV region and the set of peaks that appear on the curves of the thermally stimulated currents at negative temperatures pertain to the same localized centers, which were previously considered separately. It is assumed that these centers can be due to different states of one and the same impurity. Estimates for their concentration and the degree of occupancy at room temperature are given. The photon capture cross sections by electron traps of depth 1-2 eV are determined and the conditions for weak and strong repeated electron capture are estimated. A level diagram for the localized centers in the forbidden band of the crystal is presented. (9 refs.)

- 114568 Photovoltaic effect, diffusion and drift of nonequilibrium electrons having finite mean free paths. B.I.Sturman (Inst. of Automation & Electrometry, Acad. of Sci., USSR).

Sov. Phys.-JETP (USA), vol.83, no.5, p.1116-21 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1939-40 (Nov. 1982). [received: Sept. 1983]

The photovoltaic effect, nonequilibrium diffusion, and nonequilibrium photoconductivity are investigated for an arbitrary relation between the period of the photoinduced grating and the diffusion length of energy-relaxing photoelectrons. It is shown that under rather lax conditions the nonequilibrium photoelectric phenomena prevail over effects connected with thermalized electrons. Manifestations of nonequilibrium effects in the optical properties of crystals are investigated. (17 refs.)

114569 In_2O_3 heterojunction photocells using compounds of type $\text{A}^{\text{II}}\text{B}^{\text{IV}}\text{C}_2\text{V}$. A.A.Abdurakhimov, Yu.V.Rud', K.V.Sanin, M.Serginov, V.E.Skoryukin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.199-201 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.325-8 (Feb. 1983). [received: Sept. 1983]

Advances in optoelectronics have made it possible to design a large and diverse class of heterophotocells. Polarimetric effects can be achieved in heterophotocells with anisotropic semiconductors which can be exploited in photoanalyzers for analyzing linearly polarized light. Currently there is interest in using uniaxial crystals of the type $\text{A}^{\text{II}}\text{B}^{\text{IV}}\text{C}_2\text{V}$ to produce effective energy barriers. The authors examine the photoelectric properties of anisotropic n-p heterophotocells fabricated for the first time from semiconductors with a different crystal structure: a wide-gap ($E_g=3.6$ eV, $T=300\text{K}$) In_2O_3 oxide layer combined with crystals of ternary compounds of the form $\text{A}^{\text{II}}\text{B}^{\text{IV}}\text{C}_2\text{V}$. 72.50 ACOUSTOELECTRIC EFFECTS

114570 Sound generation by an electric current in a fluid. I.N.Didenkulov (Inst. of Appl. Phys., Acad. of Sci., Gorky, USSR).

Acoust. Lett. (GB), vol.6, no.11, p.168-71 (May 1983). Gives a calculation performed within the framework of a precise physical model. It is assumed that the region occupied by the current flowing in the fluid represents an infinite cylinder. The direction of the external homogeneous magnetic field is perpendicular to the cylinder axis. Three mechanisms of acoustic wave generation are considered. The first one is associated with the ponderomotive action of the external magnetic field on the region occupied by the current, as a result of which a dipole radiation occurs. Another mechanism of sound radiation consists in the following: The electric current flowing in the fluid induces a magnetic field, which in turn, as a result of interaction with the current, generates a force tending to reduce the size of the region occupied by the current. Finally, one more mechanism of sound excitation is possible, associated with the thermal expansion of the region occupied by the current due to its heating by the flowing electric current. Here also there is a monopole radiation. (5 refs.)

114571 Resonant amplification of sound near the spontaneous oscillation threshold of semiconductors under impurity and interband breakdown conditions. A.A.Zakharova, Yu.I.Balkarei, A.S.Bugaev, Yu.V.Gulyaev (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.256-8 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.413-17 (March 1983). [received: Sept. 1983]

An analysis is made of the problem of using self-oscillatory or potentially self-oscillatory semiconductor systems for the amplification of sound. Attention is specifically given to the possibility of resonant amplification of sound in the case when a semiconductor is close to the point of instability resulting in generation of homogeneous spontaneous oscillations associated with impurity or interband electric breakdown. (10 refs.)

72.60 MIXED CONDUCTIVITY AND CONDUCTIVITY TRANSITIONS

114572 On the stability, switching voltage and transient on-characteristics of amorphous thin films. Chun Chiang (Inst. of Phys., Acad. Sinica, Taipei, Taiwan).

Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan), vol.12, p.29-36 (Dec. 1982). [received: Sept. 1983]

By proposing that two types of reversible configurations co-existing in the film, that the ratio of two configurations is determined by current according to the law of mass action and the electronic energy transfer, that the difference of configurations may be due to phase, bonding state, filament formation, valence alternation pairs, etc., mathematical equations can be derived to explain the threshold switching, the time dependence of the threshold voltage, transient ON characteristics and the nonlinearity of the conductance. (21 refs.)

114573 Phase components and electrical conduction in the $\text{Sm}_2\text{O}_3\text{-SrO}$ system. V.B.Balakireva, A.D.Neuimin, S.F.Pal'guyev (Inst. of Electrochem., Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.9, p.1305-10 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1525-30 (Sept. 1982). [received: Sept. 1983]

The regions for the existence of solid solutions based on the oxides of samarium and strontium in the $\text{Sm}_2\text{O}_3\text{-SrO}$ system have been determined. About 6 to 7 mol.% SrO dissolves in samarium oxide, and up to 2 mol.% SmO_x dissolves in strontium oxide during the heat treatment of the samples described. The samples containing 6-7 mol.% SrO (2 mol.% vacancies) have the greatest fraction and value for the ionic conductivity. A directly proportional dependence of the ionic and electronic components of the conductivity on the SrO concentration in the solid solution is observed at low concentrations of strontium oxide (up to 1 mol.%), the slope being equal to $1/2$ for the electronic component. The introduction of strontium oxide into samarium oxide displaces the range of $\text{P}(\text{O}_2)$ in which the ionic component of the conductivity is predominant to higher partial pressures of oxygen. (11 refs.)

114574 Determination of the pressure of the semimetal-semiconductor transition in the presence of a resonant acceptor level. M.M.G.de Carvalho (Inst. de Fisica, Univ. Catolica de Campinas, Sao Paulo, Brazil), C.Fau, M.Averous.

J. Appl. Phys. (USA), vol.54, no.9, p.5470-2 (Sept. 1983).

An expression relating the pressure dependences of the resistivity and the mobile electron concentration is derived and used along with Hall effect and resistivity data to determine the pressure at which the semimetal-semiconductor transition occurs in $\text{Hg}_{1-x}\text{Cd}_x\text{Te}$ for $x=0.124$, at low temperatures. The method is applicable in the presence of a resonant acceptor level. (9 refs.)

Electrical conductivity measurements of some layered magnetic structures See Entry 114248

72.70 NOISE PROCESSES AND PHENOMENA

114575 Broad and narrow band noise of monoclinic TaS_3 . A.Maeda, M.Naito, S.Tanaka (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).

Solid State Commun. (USA), vol.47, no.12, p.1001-5 (Sept. 1983).

Narrow band noise was detected in a linear-chain CDW semiconductor, monoclinic TaS_3 in the low temperature CDW region. Broad band noise with $1/f$ spectrum in the frequency range lower than 100 kHz was also observed. The noise power was decreased with increasing temperature. The number of the CDW segments in the sample was estimated from the analysis of the broad band noise measurements. The results indicate that about 10^4 segments exist in the sample at 116K, and this number decreases with decreasing temperature. The same analysis was applied to NbSe_3 , and it was found that CDW properties are very similar between metallic NbSe_3 and semiconducting monoclinic TaS_3 . (17 refs.)

114576 Contribution to the theory of flicker noise. L.A.Vainshtein (S.I. Vavilov Inst. of Phys. Problems, Acad. of Sci., Moscow, USSR).

Sov. Phys.-JETP (USA), vol.83, no.5, p.1064-9 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1841-50 (Nov. 1982). [received: Sept. 1983]

An analysis is made of thermodynamic (equilibrium) fluctuations of the resistance due to fluctuations of the average (over the volume of a cylindrical sample) temperature because of heat exchange with an external circuit. The simplest models are used to investigate the problem of whether the spectral intensity of such fluctuations can be proportional to $1/\omega$, i.e. whether these fluctuations can be the cause of the flicker noise (known also as the excess or residual noise) and also of the $1/\omega$ or $1/f$ noise. (10 refs.)

114577 Three guises of generation-recombination noise. J.Cohen. Report NBS-TN-1173, Nat. Bur. Stand., Washington, DC, USA (April 1983), 9 pp.

It is shown that the noise in a zero-biased junction may be just a manifestation of the normally-occurring generation-recombination process, rather than shot noise, as is usually presumed. In addition, an attempt is made to clarify some noise mechanisms in semiconductors by addressing mathematical interpretation and terminology. In particular, for a biased homogeneous material at low frequencies, where the relevant transport mechanism is drift, a shot-like expression of the g-r noise equation is derived. For a zero-biased junction at low frequencies, where the relevant transport mechanism is diffusion, a pure shot-like expression of the g-r noise equation and an equivalent thermal (Nyquist) expression is derived. In both the homogeneous and the junction cases, however, the true noise remains generation-recombination noise, i.e., the origin of the noise is the fluctuations in the rates of generation and recombination of free carriers. (12 refs.)

Theory of generation-recombination noise and responsivity in overlap structure photoconductors See Entry 114559

72.90 OTHER TOPICS IN ELECTRONIC TRANSPORT IN CONDENSED MATTER

114578 Effects of axial stretching on the resistivity of carbon black filled silicone rubber. J.Kost, M.Narkis, A.Foux (Depts. of Biomedical & Chem. Engng., Technion-Israel Inst. Technol., Haifa, Israel). *Polym. Eng. & Sci. (USA)*, vol.23, no.10, p.567-71 (July 1983). The resistance and resistivity of Ketjenblack EC/silicone rubber compounds were studied as function of strain in constant strain rate experiments. Both strain and rate of strain affect the electrical resistivity of the compounds. Such effects are carbon black concentration dependent. Ketjenblack EC, a low structure black, is shown to behave differently than other blacks of high structure in the electrical resistivity-strain experiments. The resistivity in the straining experiments is determined by the transient distribution of the conductive particle array. (15 refs.)

114579 Anisotropic percolation in carbon black-polyvinylchloride composites. I.Balberg (Racah Inst. of Phys., Hebrew Univ., Jerusalem, Israel), N.Binenbaum, S.Bozowski. *Solid State Commun. (USA)*, vol.47, no.12, p.989-92 (Sept. 1983). New features of the resistivity dependence on the melt-flow-distance of carbon black-polyvinylchloride are presented. These features are compared with features obtained from the first computer study on the resistance of a two-dimensional system of conducting sticks and its dependence on the system's anisotropy. The qualitative resemblance between the two dependences and the effect of the conducting material content on these dependences, indicate clearly that the conduction in the composites is well described by an anisotropic percolation process. (16 refs.)

73.00 ELECTRONIC STRUCTURE AND ELECTRICAL PROPERTIES OF SURFACES, INTERFACES, AND THIN FILMS

73.20 ELECTRONIC SURFACE STATES

(for emission and impact phenomena, see 79.)

114580 Positronium velocity spectroscopy of the electronic density of states at a metal surface. A.P.Mills, Jr., L.Pfeiffer, P.M.Platzman (Bell Labs., Murray Hill, NJ, USA).

Phys. Rev. Lett. (USA), vol.51, no.12, p.1085-8 (19 Sept. 1983).

The velocity of positronium (Ps) formed when 1-2-keV positrons are implanted into an Al(111) target and diffuse to the clean surface has been measured. The time-of-flight distribution exhibits a sharp step at a Ps energy 2.62(4) eV in excellent agreement with the expected Ps work function $\phi_{\text{Ps}} = -2.60(3)$ eV obtained from the known electron and positron work functions of Al(111). The presence of less than a monolayer of oxygen reduces the step amplitude by a factor of 2. It is shown that this spectrum is a measure of the surface density of states. (12 refs.)

114581 Atomistic calculations of positron surface states. M.J.Puska, R.M.Nieminen (Lab. of Phys., Helsinki Univ. of Technol., Espoo, Finland). *Phys. Scr. (Sweden)*, vol.T4, p.79-82 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The authors report on the results of an atomistic, discrete-lattice calculation of positron surface states on the three principal surfaces of Al and Cu. They are able to (i) accurately reproduce the observed values and anisotropy of the binding energies, and (ii) predict the surface state lifetimes. Furthermore, the authors calculate (iii) the positron lateral diffusion constant, and find it considerably enhanced over the bulk value. They also investigate (iv) the positron trapping at surface vacancies, and (v) the effect of ordered chemisorbed monolayers of oxygen. The authors find that the oxidation lowers the binding energy and makes the surface state unstable with respect to positronium emission on Al(100) and Al(111). Implications to surface studies are discussed. (21 refs.)

114582 New type of local resonances in thin rough films. V.M.Agranovich, V.E.Kravtsov, T.A.Leskova (Inst. of Spectroscopy, Acad. of Sci., Moscow, USSR).

Solid State Commun. (USA), vol.47, no.11, p.925-30 (Sept. 1983).

A new type of local resonance is predicted. Two different mechanisms of their formation are pointed out. The first one is connected with a peculiarity of the Coulomb interaction in thin films. The second type of resonance appears when spatial dispersion in films is taken into account. The considered local resonances can take place in metal as well as semiconductor and dielectric films. (4 refs.)

114583 Temperature effects on the highly correlated electron gas of a Si-111(1×1) surface. E.Louis (ENDASA, Alicante, Spain), C.Tejedor, F.Flores.

Solid State Commun. (USA), vol.47, no.11, p.939-41 (Sept. 1983).

The effects of the temperature on the highly correlated two-dimensional electron gas of a Si-111(1×1) surface have been analysed within a Hubbard Hamiltonian, going beyond the Hartree-Fock approximation. The authors' results show that a Kondo-like peak appearing at low T disappears around 700K; moreover, they find that the surface chemical potential shifts towards the valence band. All these results offer an explanation to recent experimental data of Yokotsuka et al. (1983). (14 refs.)

114584 Investigation of the surface of gallium arsenide doped by aluminum recoil atoms. Yu.Kamenetskii, G.Petrauskas, I.Prosychev, A.Sakalas, G.Skorobogatov (V. Kapsukas Lithuanian State Univ., Vilnius, Lithuanian SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.239-41 (March 1983). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.385-9 (March 1983). [received: Sept. 1983]

An investigation was made of the surface layer of gallium arsenide doped by aluminum recoil atoms. The investigation was carried out by the methods of secondary-ion mass spectrometry, ellipsometry, and infrared spectroscopy. Doping by recoil atoms involved bombardment with 75 keV P^+ ions in doses of 1×10^{14} – 1×10^{16} cm^{-2} . The aluminum and gallium distribution profiles were determined for undoped and doped samples, the dependences of the ellipsometric parameters ψ and Δ were obtained for a surface layer of GaAs, and a study was made of a shift of the free-electron plasma reflection band as a function of the phosphorus ion dose and of the annealing temperature. It was established that doping of gallium arsenide with aluminum recoil atoms generated defects of a different type than by conventional ion implantation. (17 refs.)

73.25 SURFACE CONDUCTIVITY

114585 Field quenching of the surface conduction and two-dimensional hopping conduction of p -type InAs. I.N.Timchenko, N.N.Smironova, N.M.Stus' (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.261-3 (March 1983). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.422-5 (March 1983). [received: Sept. 1983]

Surface conduction of p -type InAs was investigated at low temperatures using samples in the form of n - p - n structures. Under a certain voltage such a structure switched from a low-resistivity state to one with a much higher resistivity and this was attributed to the field quenching of the 'frozen-in' conductivity of an inversion channel. Hopping conduction was observed and it was attributed to jumps of electrons between localization centers in the inversion channel. Some parameters of the energy band of localized states were estimated. (10 refs.)

114586 Two-dimensional surface electrons in semiconducting p -type $\text{Hg}_{1-x}\text{Cd}_x\text{Te}$ with an anodic oxide. A.I.Elizarov, L.P.Zverev, V.V.Kruzhav, G.M.Min'kov, O.E.Rut (A.M. Gorki Ural State Univ., Sverdlovsk, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.284-6 (March 1983). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.459-63 (March 1983). [received: Sept. 1983]

An investigation was made of the influence of anodic oxidation on galvanomagnetic effects in semiconducting p -type $\text{Hg}_{1-x}\text{Cd}_x\text{Te}$ with $x=0.19$ -0.20 and $N_A \approx 1 \times 10^{17} \text{ cm}^{-3}$. Anodic oxidation produced an n -type inversion layer on the semiconductor surface and the presence of this layer increased the conductivity at $T < 40\text{K}$ and resulted in double reversal of the sign of the temperature dependence of the Hall coefficient. Samples with an anodic oxide exhibited Shubnikov-de Haas oscillations of the transverse magnetoresistance, the period and position of which were governed by the magnetic field component normal to the anodized surface of the sample, demonstrating the two-dimensional nature of carriers in the inversion layer. Estimates were obtained of the density and mobility of these size-quantized surface electrons. (14 refs.)

114587 Oscillations of metal-plate impedance and character of electron reflection. I.F.Voloshin, N.A.Podlevskikh, V.G.Skobov, L.M.Fisher, A.S.Chernov (V.I. Lenin All-Union Electrotech. Inst., USSR).

Sov. Phys.-JETP (USA), vol.83, no.5, p.1130-9 (Nov. 1982). Translation of: *Zh. Eksp. i Teor. Fiz. (USSR)*, vol.83, no.5, p.1955-70 (Nov. 1982). [received: Sept. 1983]

The surface impedance of a metallic plate as a function of a magnetic field perpendicular to the plate is investigated theoretically and experimentally. The integro-differential equation for the RF field distribution in the plate is solved under the assumption that electron reflection from the surface can be described by an arbitrary Fuchs specular coefficient p . A solution is obtained for magnetic field values greatly exceeding the doppleron threshold field. The plate impedance is calculated on the basis of the obtained field distribution. The influence of specularly reflected electrons on the shape of the impedance oscillations is studied. It is shown that analysis of the shapes of the doppleron oscillations and of the Gantmakher-Kaner oscillations can yield the value of p for resonant carriers. A method is developed for the analysis of the shape of the experimentally recorded oscillations. Tungsten-plate-impedance measurements needed to determine the specularly coefficient of resonant electrons and their mean free paths are performed. The values of the specularly coefficients are found. The behavior of p when the magnetic field deviates from normal to the surface is studied experimentally. (16 refs.)

Si on cubic zirconia See Entry 114388

73.30 SURFACE DOUBLE LAYERS, SCHOTTKY BARRIERS, AND WORK FUNCTIONS

114588 Characteristics of Schottky diodes with microcluster interface. M.V.Schneider (Bell Labs., Crawford Hill Lab., Holmdel, NJ, USA), A.Y.Cho, E.Kollberg, H.Zirath.

Appl. Phys. Lett. (USA), vol.43, no.6, p.558-60 (15 Sept. 1983).

The author present experimental evidence that a single Schottky diode on GaAs is an agglomerate of paralleled microjunctions with different barrier heights and saturation currents. The current-voltage characteristic of the cluster breaks up into sections of exponentials with different slopes as one cools the diode from 300 to 10K. Noise measurements performed on cooled diodes at 4 GHz also confirm that a single device is a cluster of paralleled diodes. (8 refs.)

114589 Characterization of WSi_2/GaAs Schottky contacts. T.Ohnishi, N.Yokoyama, H.Onodera, S.Suzuki, A.Shibatomi (Fujitsu Labs. Ltd., Atsugi, Japan).

Appl. Phys. Lett. (USA), vol.43, no.6, p.600-2 (15 Sept. 1983).

The Schottky diode characteristics of WSi_2 contacts on n -type GaAs have been investigated and correlated to the film stress in WSi_2 and crystallographic properties of the film. Experimental results show that (1) the high-temperature stability of WSi_2/GaAs Schottky diode characteristics depends significantly on Si content; (2) WSi_2/GaAs contacts exhibit very high-temperature-stable Schottky diode characteristics at Si content around 0.60, and at this Si content no metallurgical interactions between WSi_2 and GaAs are observed by 2-MeV $^4\text{He}^+$ Rutherford backscattering (RBS) measurements; (3) the optimum Si content for Schottky diode characteristics coincides with that for stress minimum in WSi_2 ; (4) the Schottky diode characteristics are not affected by whether WSi_2 is crystallized or not, and a common feature of the regions where the Schottky diode characteristics are very high-temperature stable is that each consists of single-phase (W_5Si_3 secondary solid solution or amorphous). (7 refs.)

114590 Metallurgically grown Schottky junction in directionally solidified eutectic Ag-Si alloys. M.Arnold, J.Fruhauf, H.G.Schneider (Sektion Phys.-Elektronische Bauelemente, Tech. Hochschule Karl-Marx-Stadt, Karl-Marx-Stadt, Germany).

Cryst. Res. & Technol. (Germany), vol.18, no.8, p.1015-20 (1983).

Metallurgically grown M(metal)-S(semiconductor) phase boundaries in directionally solidified Ag-Si alloys were investigated relative to their behaviour as Schottky junctions. By the aid of point contacts I/V characteristics have been measured which correspond to these ones of Schottky diodes. The Si crystallites were proved to be n -doped. Reverse breakdown voltages of 8...24 V are not incompatible with the purity of the used materials. In forward direction the value of diode factor $n=1.1...5$ shows the existence of several current flow mechanisms. In order to be able to interpret the characteristics it is necessary to have exact information on the specific resistivity of the Si crystallites and on the content of grain boundaries and dislocation in silicon. Beyond that the complicated shape of Si crystallites prevents the necessary determination of the interface size. (11 refs.)

114591 A theory of the admittance of an amorphous silicon Schottky barrier. I.W.Archibald, R.A.Abram (Dept. of Appl. Phys. & Electronics, Univ. of Durham, Durham, England).

Philos. Mag. B (GB), vol.48, no.2, p.111-25 (Aug. 1983).

In a recent paper Abram and Doherty (1982) described a calculation of the frequency-dependent differential capacitance of an amorphous silicon Schottky barrier. In this paper the authors adopt the same model of the Schottky barrier but employ a rather different method of analysis to calculate both the capacitance and the conductance. These are given at explicit formulae in terms of the angular frequency, the d.c. bias and the density of electronic states of the amorphous silicon. The expression for the capacitance is identical to that obtained by Abram and Doherty. Numerical results for the admittance as a function of frequency and bias are presented for a density of states consisting of a single peak in a constant background, and for two forms of the density of states that have recently been proposed for amorphous silicon. The results suggest that the frequency dependence of the conductance is the most sensitive indicator of features in the density of states of amorphous silicon. (6 refs.)

114592 Screening length in an extrinsic semiconductor. N.A.Penin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.266-9 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.431-6 (March 1983). [received: Sept. 1983]

A definition of the screening length of an extrinsic semiconductor is proposed. It represents a combination of two limiting cases of the Debye screening ($|e\phi| \ll kT$) and of the Schottky process ($|e\phi| \gg kT$). A derivation is given of a formula for the screening length of an extrinsic semiconductor containing one-level (or two-level) and compensating impurities in the absence of the minority carriers. The dependences of the screening length on the magnitude and sign of the screened potential are considered for different degrees of compensation and for temperatures corresponding to incomplete ionization of the impurities. 73.40 INTERFACES

114593 Epitaxial $\text{InP}/\text{fluoride}/\text{InP}(001)$ double heterostructures grown by molecular beam epitaxy. C.W.Tu, S.R.Forrest, W.D.Johnston, Jr. (Bell Labs., Murray Hill, NJ, USA).

Appl. Phys. Lett. (USA), vol.43, no.6, p.569-71 (15 Sept. 1983).

The authors report the first epitaxial semiconductor-dielectric-semiconductor (SDS) double heterostructures using the III-V compound semiconductor InP . The samples, $\text{InP}/\text{CaF}_2/\text{InP}(001)$ and $\text{InP}/\text{Ba}_2\text{Sr}_{1-x}\text{F}_2/\text{InP}(001)$, were grown by molecular beam epitaxy and have lattice mismatches of -6.9% and $+2.0\%$, respectively. In situ high-energy electron diffraction showed that the initial stage of epitaxy of the $\text{InP}/\text{fluoride}$ structure, unlike that of the $\text{fluoride}/\text{InP}$ structure, exhibits pseudomorphism. Analysis of the electrical properties of SDS devices with an insulator thickness of $\sim 100 \text{ \AA}$ indicates both Ohmic and trap-assisted tunneling conduction. (18 refs.)

114594 Electrical characteristics of Be-implanted GaAs diodes annealed with an ultrahigh power argon arc lamp. K.Tabatabaie-Alavi, A.N.M.M.Choudhury, H.Kanbe, C.G.Fonstad (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA), J.C.Gelpey.

Appl. Phys. Lett. (USA), vol.43, no.7, p.647-9 (1 Oct. 1983). The potential of arc lamp annealing techniques in GaAs device processing is demonstrated by the fabrication of Be-implanted mesa pin diodes. Implants were done at 50 and 120 keV with doses of 4.4×10^{14} and $5.1 \times 10^{14} \text{ cm}^{-2}$, respectively (total dose $= 9.5 \times 10^{14} \text{ cm}^{-2}$) into a $14\text{-}\mu\text{m}$ -thick undoped ($N_D \sim 7.5 \times 10^{14} \text{ cm}^{-3}$) GaAs epitaxial layer grown by vapor phase epitaxy. Ten second annealing cycles with peak temperatures of 950°C and 1050°C have been studied. The electrical characteristics of these diodes are superior to published furnace-annealed, Be-implanted GaAs diodes. (13 refs.)

114595 Tunneling between conductors with a charge-density wave. S.N.Artemenko, A.F.Volkov (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR).

JETP Lett. (USA), vol.37, no.7, p.368-70 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.310-13 (5 April 1983). [received: Oct. 1983]

The current through a P_1 - I - P_2 tunnel junction [$P_{1,2}$ are conductors with a charge-density wave (CDW)] is calculated. It is shown that aside from a term proportional to the product of the densities of states, the current includes a term containing $\cos(\chi_1 - \chi_2)$, where $\chi_{1,2}$ are the phases of the CDW. 114596 Energy levels and alloy scattering in InP-In(Ga)As heterojunctions. G.Bastard (Ecole Normale Supérieure, Paris, France).

Appl. Phys. Lett. (USA), vol.43, no.6, p.591-3 (15 Sept. 1983).

The author presents the results of self-consistent variational calculations for the energy levels and wave functions of modulation-doped InP-In(Ga)As heterojunctions. With the variational wave functions they calculate the electron scattering by alloy disorder. Retaining the bulk In(Ga)As value ($\sim 0.6 \text{ eV}$) for the alloy disorder potential the mobility limited by alloy disorder is only $\sim 2 \times 10^5 \text{ cm}^2/\text{Vs}$ for $n_c \sim 3 \times 10^{11} \text{ cm}^{-2}$. (9 refs.)

114597 Auger voltage contrast depth profiling of shallow p - n junctions. R.Pantel (CNET, Meylan, France).

Appl. Phys. Lett. (USA), vol.43, no.7, p.650-2 (1 Oct. 1983).

A contactless measurement technique for electrical depth profiling of very shallow p - n junctions using a scanning Auger microscope is presented. The physical principle is the detection of variations in internal potential via shifts in the Auger peaks. Depth profiling of shallow junctions is realized by ion milling. Deep junctions are more rapidly analyzed via bevelling. For a p - n junction of classical depth (3500 \AA), Auger voltage contrast depth profiling is compared with spreading resistance measurements and shown to be an accurate and sensitive means of detecting low concentrations of electrically active impurities (in the 10^{15} cm^{-3} range). The main advantage of the method is excellent depth resolution when using ion milling. This is demonstrated for a very shallow p - n junction (400 \AA). (24 refs.)

114598 Inequality of semiconductor heterojunction conduction-band-edge discontinuity and electron affinity difference. R.S.Bauer, P.Zurcher, H.W.Sang (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).

Appl. Phys. Lett. (USA), vol.43, no.7, p.663-5 (1 Oct. 1983).

The commonly used Anderson electron affinity rule is shown not to provide the band-edge offsets at the interface between different semiconductors. Using synchrotron radiation excited photoelectron spectroscopy, the authors determine electron affinities χ of $4.14_{-0.09}^{+0.17} \text{ eV}$ for a $\text{Ge}(110)$ surface and of $4.15_{-0.09}^{+0.17} \text{ eV}$ for a $18\text{-}\text{\AA}$ $\text{GaAs}(110)$ epitaxial overlayer on $\text{Ge}(110)$. In the same experiment, for the same layers, a conduction-band discontinuity ΔE_c of $0.54 \pm 0.08 \text{ eV}$ is measured for the heterojunction of GaAs grown by molecular beam epitaxy on $\text{Ge}(110)$. Compilation of data on 14 recent photoemission studies confirms that $\Delta E_c \neq \Delta\chi$ for most heterojunction systems investigated to date. (25 refs.)

114599 Simulation and measurement of C/V doping profiles in multilayer structures $[\text{Ga}_{1-x}\text{Al}_x\text{As}]$. J.E.A.Whiteaway (Standard Telecommunication Labs. Ltd., Harlow, England).

IEEE Proc. I (GB), vol.130, no.4, p.165-70 (Aug. 1983).

C/V doping profiles are simulated through n -type multilayer structures containing heterojunctions. The perceived doping profile obtained from C/V measurements can differ markedly from the actual carrier profile in the vicinity of a hetero- or homojunction. The model is applied to conventional FET structures, high-electron-mobility transistors and superlattices. (12 refs.)

114600 Response to 'Critique of two recent theories of heterojunction lineups'. A.Nussbaum (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA).

IEEE Electron Device Lett. (USA), vol.EDL-4, no.8, p.267-8 (Aug. 1983).

The author clarifies some misunderstandings in a recent paper by Kroemer (see *ibid.*, vol.EDL-4, no.2, p.25-6, 1983). (12 refs.)

114601 A comparative study of the properties of single velocity and double velocity heterojunction IMPATT diodes. R.U.Khan (Dept. of Electronics Engng., Inst. of Technol., Banaras Hindu Univ., Varanasi, India), B.B.Pal.

J. Inst. Electron. & Telecommun. Eng. (India), vol.29, no.2, p.68-71 (Feb. 1983).

A comparative study has been made on the properties of Ge-GaAs single velocity and double velocity heterojunction (HJ) IMPATT diodes. It is observed that for high frequency operation double velocity HJ IMPATT will give more power than the single velocity HJ IMPATT and the homo junction IMPATT (i.e. SDR IMPATT). (7 refs.)

114602 Calculation of the cyclotron resonance linewidth in GaAs-AlGaAs heterostructures. R.Lassnig, E.Gornik (Inst. für Experimentalphys., Univ. Innsbruck, Innsbruck, Austria).

Solid State Commun. (USA), vol.47, no.12, p.959-63 (Sept. 1983).

The influence of various scattering center distributions on the Landau level width and the cyclotron resonance linewidth is calculated for GaAs-AlGaAs heterostructures in high magnetic fields. The filling factor dependent dielectric screening of long range potentials leads to an oscillating behavior of the linewidth. Good agreement with recent cyclotron resonance linewidth measurements is obtained. (9 refs.)

114603 Electrical conductivity of semiconductors with grain boundaries and spectroscopy of boundary states in the presence of a tunnel current. E.I.Gol'dman, A.G.Zhdan, Yu.V.Markin, P.S.Sul'zhenko (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.242-4 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.390-3 (March 1983). [received: Sept. 1983]

The conditions for effective tunneling of carriers across a semiconductor-semiconductor grain-boundary barrier are determined and possible errors due to lack of allowance for the tunneling are estimated for the case when the parameters of semiconductors are deduced from the current-voltage characteristics of a grain boundary. It is shown that, depending on the characteristics of a material and the experimental conditions, the tunnel mechanism of electrical conduction may predominate. Families of characteristic curves are obtained and these can be used to estimate the contribution of the tunneling to the electrical conductivity of a boundary region in real materials. The conditions under which a theory developed without allowance for the tunneling of carriers can be used in spectroscopy of boundary states are determined for the case when the tunnel component of the current reduces the barrier effectively by $\approx kT$. This theory describes the conductivity of grain boundaries in a wide range of fields and temperatures that do not suppress the boundary barrier and it is in quantitative agreement with the results of similar earlier calculations carried out for the same range of conditions. (13 refs.)

114604 Investigation of the influence of the Auger recombination process on the current-voltage characteristics of multilayer silicon structures. A.S.Zubrilov, V.A.Kuz'min, T.T.Mnatsakanov, L.I.Pomortseva, V.B.Shuman (V.I. Lenin All-Union Electrical Engng. Inst., Moscow, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.293-6 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.474-8 (March 1983). [received: Sept. 1983]

A study was made of the influence of the Auger recombination process on the current-voltage characteristics of multilayer silicon structures in the intermediate range of current densities, when several nonlinear effects such as the Auger recombination process, electron-hole scattering, etc. make considerable contributions to the current-voltage characteristics, but none of them predominates over the others. Analytic expressions for the current-voltage characteristics and for the injection efficiencies of abrupt p - n junctions are derived and analyzed. The results of calculations are found to be in agreement with the experimental data. (10 refs.)

114605 Physics of two dimensional electron system in $\text{Al}_x\text{Ga}_{1-x}\text{As}/\text{GaAs}$ heterojunction interface. S.-I.Narita. *Solid State Phys. (Japan)*, vol.18, no.6, p.315-32 (June 1983). In Japanese. Recent investigations on the two dimensional electron gas in $\text{Al}_x\text{Ga}_{1-x}\text{As}/\text{GaAs}$ heterostructures are introduced and discussed in comparison with those on the Si-MOS system. 73.40M Semiconductor-electrolyte contacts

114606 Semiconductor electrodes. XLIX. Evidence for Fermi level pinning and surface-state distributions from impedance measurements in acetonitrile solutions with various redox couples. G.Nagasubramanian, B.L.Wheeler, A.J.Bard (Dept. of Chem., Univ. of Texas, Austin, TX, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.8, p.1680-7 (Aug. 1983). Capacitance-voltage (C - V) measurements were made for the single crystal semiconductors $n\text{-TiO}_2$, n -CdS, n -InP, p -Si, p -GaAs, n - and p - WSe_2 , and n - MoSe_2 in acetonitrile containing a number of redox couples whose potentials (V_{redox}) spanned a potential regime much wider than the bandgaps. The flat-band potential (V_{FB}) evaluated from capacitance-potential (C - V) measurements (Mott-Schottky plots) exhibited three types of behavior with varying solution redox potentials: (i) V_{FB} varied monotonically with V_{redox} for p -Si, p -GaAs, and n -InP; (ii) for n - TiO_2 and n -CdS, V_{FB} did not shift for couples located negative of the midgap potential, but varied monotonically for couples positive of this value; (iii) for the layer-type, compounds (MoSe_2 , WSe_2), V_{FB}

was almost independent of V_{redox} . These differences were ascribed to differences in surface-state densities. For n - TiO_2 crystals, (001) face etched with molten KHSO_4 and reduced, evidence for surface states at two different potentials was obtained from the in-phase component of the total admittance. Tentative assignment of these states is to lattice defects. The states closer to the conduction band are assigned to oxygen vacancies and the deeper states to Ti(III) . The densities of surface state (N_s) evaluated from G_p/ω vs. ω plots for TiO_2 and p -Si are around 10^{10} and 10^{13} cm^{-2} , respectively. (34 refs.)

114607 The recombination of photogenerated minority carriers in the depletion layer of semiconductor electrodes. W.J.Albery, P.N.Bartlett (Dept. of Chem., Imperial Coll. London, London, England). *J. Electrochem. Soc. (USA)*, vol.130, no.8, p.1699-706 (Aug. 1983).

The problem of depletion layer recombination in illuminated semiconductor electrolyte systems, as used for solar energy conversion, is considered. It is shown that there can be four different kinetic cases. The conditions for the existence of these different cases as a function of the potential drop across the depletion layer, the irradiance, and the photocurrent are derived. Analytical solutions for current voltage curves for the different cases are derived and criteria for distinguishing between the different cases are given. The effects of concentration polarization of the majority carriers are considered and shown to be negligible for typical semiconductors. (7 refs.)

73.40N Metal-nonmetal contacts

114608 Surface compensation of p -InP as observed by capacitance dispersion. R.K.Ahrenkiel, P.Sheldon, D.Dunlavy, L.Roybal (Solar Energy Res. Inst., Golden, CO, USA), R.E.Hayes. *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.675-6 (1 Oct. 1983).

Very strong capacitance-voltage dispersive effects are observed in mercury/indium phosphide Schottky diodes. These effects are related to a partially compensated region at the surface for which the Debye length is relatively large. The small-signal capacitance is indicative of a critical dielectric relaxation time exceeding the period of the AC probe. This effect may be used to characterize the majority-carrier profile in lightly doped or low mobility semiconductors. (7 refs.)

114609 Serial-layered-transmission line contact-resistance representation for partially overlaid Al-to-contacts to silicon. A.Sugerman (IBM General Technol. Div., Hopewell Junction, NY, USA). *Solid-State Electron. (GB)*, vol.26, no.9, p.917-22 (Sept. 1983).

The author has developed a contact resistance representation for metallurgical systems having two interfacial conductive and resistive layers to a semiconductor surface. This configuration results when an interconnect metal (e.g. Al), which only partially overlays a contact metal (e.g. silicide), reacts with it to form a less conductive interface. As a consequence, circuit designers can take advantage of the unreacted region's lower contact resistance to ease circuit layout constraints. Contact resistance minima are suggested by the degree of overlaid or reacted segment and specific contact resistance degradation trade-off. A coupling of two layered transmission lines is used to simulate these two segment contacts. The model is compared to measurements of hardware. (6 refs.)

114610 Properties of metal-chalcogenide glassy semiconductor structures in the case of occurrence of electrically stimulated chemical reactions at the interface. Poluprovodn. (USSR)*, vol.17, no.3, p.491-3 (March 1983). [received: Sept. 1983]

The authors report the results of an experimental investigation of the absorption spectra and of the temperature dependence of the electrical conductivity of Al-GCS structures in the case of occurrence of electrically stimulated chemical changes at the interface. (7 refs.)

114611 Ion irradiation effects on Pt contacts to Si with and without interfacial chemical oxide. T.Banwell, M.Finetti, I.Suni, M.-A.Nicolet (California Inst. of Technol., Pasadena, CA, USA), S.S.Lau, D.M.Scott. Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.411-15.

The electrical properties of ion irradiated metal-semiconductor contacts are investigated. Silicide contacts are fabricated by depositing Pt on chemically clean or slightly oxidized ($\sim 14 \text{ \AA SiO}_2$) n^+ - and n -type (111) Si, followed by a Si ion irradiation ($10^{14.6} \times 10^{15} \text{ Si/cm}^2$) through the metal-Si interface at various substrate temperatures, and a final thermal annealing in vacuum to form the silicide. Forward I-V measurements are employed for electrical characterization. Metal-Si interaction and substrate damage are measured by MeV ion backscattering and channeling, and interfacial oxygen monitored by nuclear $^{16}\text{O}(d,\alpha)^{14}\text{N}$ reaction. 114612 Characteristic electronic defects at the Si-SiO₂ interface. N.M.Johnson, D.K.Biegelsen, M.D.Moyer, S.T.Chang (Xerox Palo Alto Res. Center, Palo Alto, CA, USA), E.H.Poindexter, P.J.Caplan. *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.563-5 (15 Sept. 1983).

On unannealed, thermally oxidized silicon, electron spin resonance reveals an oriented interface defect which is termed the P_b center and identified as the trivalent silicon defect. Deep level transient spectroscopy (DLTS) reveals two broad characteristic peaks in the interface-state distribution: one $\sim 0.3 \text{ eV}$ above the silicon valence-band maximum and a second $\sim 0.25 \text{ eV}$ below the conduction band. Isochronal anneals of oxidized silicon, coated with aluminum, show that the spin density and the densities of the two DLTS peaks

have the same annealing kinetics. On large-area, Al-gated capacitors the spin density can be modulated with an applied voltage; sweeping the silicon band gap at the interface through the Fermi level reveals that the spin density is approximately constant over the central region of the band gap but decreases near the band edges. The variation of the spin density with gate voltage identifies an amphoteric center with both electronic transitions in the band gap. Both the annealing behavior and the voltage dependence of the P_b center support the conclusion that these transitions correspond to the two characteristic peaks in the interface-state distribution. The ~ 0.6 eV separation of the peaks is the effective correlation energy of the dangling orbital on a trivalent silicon defect at the Si-SiO₂ interface. The similarity between the disordered interface and amorphous silicon is discussed. (16 refs.)

114613 Surface plasmon emission in metal-insulator-degenerate p-type semiconductor structures. S.R.Whiteley, L.Z.Xie, R.Hemphill, T.K.Gustafson (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA).

Appl. Phys. Lett. (USA), vol.43, no.6, p.566-8 (15 Sept. 1983). The complex dispersion relation for the antisymmetric plasmon mode in the presence of the tunneling interaction in In-In₂O₃-SnTe tunnel junctions is solved numerically. Net amplification of the mode may be possible at submillimeter and far infrared wavelengths in cooled junctions. (13 refs.)

114614 Small device technology, dielectric semiconductor systems. T.Sugano (Dept. of Electronic Engng., Univ. of Tokyo, Tokyo, Japan). *Acta Polytech. Scand. Electr. Eng. Ser. (Finland)*, no.EL50, p.183-278 (1983). (Proceedings of Helsinki International Summer School on Semiconductors 1982, Espoo, Finland, 14-18 June 1982).

Rutherford backscattering spectrometry has been proved to be useful for detecting non-registered Si atom layers of the Si substrate in the vicinity of the interface with the SiO₂ film. Chemical structure of the Si-SiO₂ transition region has been revealed by X-ray photoelectron spectroscopy (XPS). Morphology of Si-SiO₂ interfaces has been examined with both cross-sectional and normal transmission electron microscopy in conjunction with surface roughness scattering of electrons in the surface inversion layer. Much effort has been expended into the electrical characterization of the trap states of Si-SiO₂ interfaces, and a physical model of interface trap states with U-shaped continuous distribution has been proposed. Current understanding of Si-SiO₂ systems is reviewed and properties of dielectric III-V semiconductors are discussed. (43 refs.)

114615 Electrical characteristics of an upper interface on a buried SiO₂ layer formed by oxygen implantation. S.Nakashima, K.Ohwada (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1119-24 (July 1983). The electrical characteristics of an upper interface on a buried oxide layer formed by oxygen implantation in an Si wafer, and subsequent thermal annealing were studied using an MOS diode and capacitance-voltage (C-V) measurements. The measured C-V curves strongly depended on the ion dose. The C-V curve was independent of the gate voltage for a dose of 1.2×10^{18} cm⁻², voltage-dependent for doses above 1.8×10^{18} cm⁻², and similar to those for thermal oxide for a dose of 2.4×10^{18} cm⁻². This strong dependence on the ion dose is considered to result from a change in the interface structure with increase in dose. In this change, the transition layer existing between the buried oxide and the upper Si layer at low doses, which shields the upper Si layer from external electric fields, disappears with increase in dose. (26 refs.)

114616 Interface between a semiconductor and an ultrathin film of its oxide. O.V.Romanov (A.A. Zhdanov State Univ., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.247-9 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.398-401 (March 1983). [received: Sept. 1983]

A systematic investigation was made of the laws governing the formation of a double electric layer at an interface between a semiconductor and an ultrathin film of its intrinsic oxide. This was done for a large number of semiconductor materials belonging to vertical series of analogs of group IV elements (Si, Ge) and of III-V compounds (InP, InAs, InSb, GaN, GaP, GaAs, GaSb). It was found that already at the stage of nucleation of an oxide of a given semiconductor ($d_{ox} < 10^2$ Å) a specific double electric layer appeared on the surface and the nature of this layer was governed by the structure as well as by the physical and chemical properties of the investigated system. The results obtained were used to develop a model of an insulator-semiconductor interface. (15 refs.)

114617 Problem of the relaxation spectroscopy of deep centers in semiconductors. P.T.Oreshkin, Yu.V.Garmash, A.I.Perelygin (Radio Engng. Inst., Ryazan, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.309-10 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.496-8 (March 1983). [received: Sept. 1983]

The authors report experimental results obtained for Al-Si₃N₄-SiO₂-Si type MIS structures which confirm their previously reported relaxation mechanism (see *ibid.*, vol.15, p.105, 1981). They used the usual C-t method but determined the transient process time t_c instead of the relaxation time τ . (15 refs.)

114618 Initial (nonintrinsic) breakdown and defects in the dielectrics of MOS structures based on silicon. G.N.Demidova, N.I.Gavrilin, O.P.Gludkin, S.K.Korovin (Moscow Aviation Technol. Inst., Moscow, USSR).

Sov. Microelectron. (USA), vol.12, no.1, p.20-5 (Jan.-Feb. 1983). Translation of: *Mikroelektronika (USSR)*, vol.12, no.1, p.24-8 (Jan.-Feb. 1983). [received: Sept. 1983]

An investigation of the initial breakdown of silicon oxide in industrially prepared MOS structure is the subject of the present work. In n⁺ polysilicon-SiO₂-p-Si structures there was no correlation between the excess current (up to four orders of magnitude) and the field strength for initial breakdown. It is possible that the initial breakdown and the excess currents are due to a different type of defect for electron injection from the polysilicon gate. The authors obtained the dependence of the defect density on the field strength with which they appear. It is shown that in the oxide of a n⁺ polysilicon-SiO₂-n type single crystal Si structure with injection of electrons from the substrate there is a single type of defect density of about 330 cm⁻² whose spatial distribution obeys Boltzmann statistics. (11 refs.)

114619 Generation of surface states in MOS structures based on indium antimonide. V.N.Davydov, E.A.Loskutova (Siberian Physicotech. Inst., USSR).

Sov. Microelectron. (USA), vol.12, no.1, p.25-9 (Jan.-Feb. 1983). Translation of: *Mikroelektronika (USSR)*, vol.12, no.1, p.37-41 (Jan.-Feb. 1983). [received: Sept. 1983]

Discusses anodized InSb structures and investigates the effect of a voltage applied to the structure and of short-wavelength radiation with a wavelength 0.3-1.0 μm on the amount of fixed charge Q_g in the dielectric, the distribution N_{ss}(E) of the surface state density (SSD) over the band, and the dependence of the stationary photovoltage on the voltage U_c(V) on the field electrode in n type INSb structures. The authors used single crystals with a [211] orienta-

tion and a minority carrier concentration of 2.10¹⁴ cm⁻³ at 77K for preparing the structures. The electrochemical oxidation of the semiconductor surface was carried out in a solution of orthophosphoric acid in ethylene glycol under galvanostatic conditions with a current density of 1 mA/cm² for 10 min. The anodic oxide film produced had a thickness of ~ 0.1 μm and a leakage current density less than 10⁻¹² A/cm². (15 refs.)

114620 Inelastic electron tunneling spectroscopy on ultrahigh vacuum prepared tunnel junctions. M.Liehr, S.Ewert (2. Phys. Inst., Rheinisch-Westfälischen Tech. Hochschule Aachen, Aachen, Germany). *Z. Phys. B (Germany)*, vol.52, no.2, p.95-7 (1983).

Inelastic electron tunneling (IET) spectra of clean ultrahigh vacuum (UHV) prepared (Al/Al oxide/Pb) tunnel junctions are discussed. Microcrystalline Al oxide is shown to grow on these Al films. This is in contrast to the formation of amorphous Al oxide in the common high vacuum (HV) preparation process. The IET-spectra of UHV prepared tunnel junctions are free of peaks due to contaminations. Conclusions concerning the growth of oxides on Al films are drawn. (16 refs.)

114621 Tunnelling in aluminium/aluminium-oxide/palladium junctions: hydrogen-induced variations. A.Diligenti, M.Stagi (Istituto di Elettronica e Telecomunicazioni, Univ. de Pisa, Pisa, Italy).

Electron. Lett. (GB), vol.19, no.18, p.717-18 (1 Sept. 1983). The tunnel current of aluminium/aluminium-oxide/palladium (Al/Al₂O₃/Pd) junctions, obtained by means of sapphire sputtering has been measured in air and in hydrogen-nitrogen atmosphere at various H₂ concentrations ranging from 2 to 100% and at room temperature. It has been found that the tunnel current undergoes a significant change as a consequence of Pd work function lowering induced by the hydrogen. The ratio between the tunnel current in H₂ and in air has a value in the range 10⁻²-10⁰, depending on the oxide thickness. The increase of the current occurs in some hundreds of milliseconds if the hydrogen is emitted at atmospheric pressure. (12 refs.)

114622 Study of lead-lead-oxide-lead tunnel junctions down to liquid nitrogen temperature. M.Prasad, A.K.Gupta, N.D.Kataria, V.S.Tomar (Nat. Phys. Lab., New Delhi, India).

Indian J. Cryog., vol.8, no.1, p.39-42 (1983). A detailed study of lead-lead-oxide-lead junctions has been carried out to study temperature dependence of the junction resistance in the range 30° to -196°C. The oxide barriers in all cases are grown using the thermal oxidation technique. Junctions are classified in two categories: one with resistance of order of 0.5 ohm and more as high resistance (HR) and those below as low resistance junctions (LR). HR junctions show linear increase of resistivity as the temperatures are lowered from room temperature down to -196°C. However, LR junctions show an anomalous behaviour which is due to the temperature variation of the film resistance. (5 refs.)

114623 Some peculiarities in the spectral characteristics of metal/insulator/metal structures at constant biases. A.G.Abdullayev, A.M.Karnaukhov, K.I.Abdullayev, Sh.B.Azizov (Inst. of Space Res. for Natural Resources, Acad. of Sci., Baku, Azerbaijan SSR).

Thin Solid Films (Switzerland), vol.106, no.3, p.L89-L90 (19 Aug. 1983). Investigations of the mechanism of the current transition in thin film Al/Al₂O₃/M structures with an electrolytically anodized layer showed Schottky emission for Al₂O₃ thicknesses of 150-2000 Å, at temperatures of 300-600 K and at electric fields E of 5×10⁴ V cm⁻¹ or more. This allowed the authors to determine the average magnitude of the dielectric constant ε(Al₂O₃) to be 7.8, which agrees well with the data of other researchers. However, they observed no marked asymmetry in the current-voltage characteristics when copper, silver or gold, which have different work functions, were used for the upper (non-oxidized) electrode. Hence the spectral characteristics of the photocurrent through the structure with a semitransparent upper electrode were investigated. (3 refs.)

73.60 ELECTRONIC PROPERTIES OF THIN FILMS

114624 Electronic properties of a size-quantized film with uneven boundaries. S.Yu.Potapenko, A.M.Satanin (Physicotech. Res. Inst., Gorki, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.334 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.587-8 (Feb. 1983). [received: Sept. 1983]

The authors present a new approach to the study of electronic states in a film with rough surfaces described by the functions $z_1 = \xi(\rho)$, $z_2 = a + \eta(\rho)$, $\rho = (x, y)$. By a transformation to a curvilinear coordinate system the problem reduces to an analysis of the Schrodinger equation with an effective Hamiltonian. (4 refs.)

114625 Effect of thickness on the electrical properties of AlSb thin films. S.M.Patel, A.M.Biradar (Dept. of Phys., Sardar Patel Univ., Vallabh Vidyanagar, India).

Indian J. Pure & Appl. Phys., vol.21, no.7, p.418-19 (July 1983). Aluminium antimonide thin films of different thicknesses were prepared using co-evaporation method. The variations, with film thickness, of the Hall coefficient R_H , Hall mobility μ_H , and carrier concentration n , have been determined. It is observed that with increase in the film thickness the mobility of the carriers increases whereas the carrier concentration decreases. The maximum carrier mobility observed in the present study is $15 \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$ on the thickest film ($t=8000 \text{ \AA}$) with lowest carrier concentration of $7 \times 10^{17} \text{ cm}^{-3}$. (5 refs.)

114626 Dark conductivity peak in p-type glow-discharged a-SiC:H films. O.Kuboi (Komatsu Electronic Metals Co., Kanagawa, Japan).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1749-52 (Aug. 1983). The author reports the doping characteristics of a-SiC:H, specifically the dark conductivity peak of p-type a-SiC:H. When the CH_4 concentration in the gas mixture of SiH_4 , CH_4 and B_2H_6 was varied under constant B_2H_6 concentration, a clear dark-conductivity peak was observed for glow-discharged a-SiC:H film at nearly 20% of CH_4 . The peak becomes clearer below 0.5% of B_2H_6 in the gas mixture. The author has not yet seen this feature reported in the literature. No peak is observed for undoped and phosphorus-doped a-SiC:H. (6 refs.)

114627 Recombination processes in polycrystalline PbSe films. N.P.Anisimova, T.R.Globus, L.K.Diklov, Yu.V.Kalinin, T.G.Nikolaeva, A.O.Olesk. *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.336-8 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.534-7 (March 1983). [received: Sept. 1983]

The authors examined the carrier recombination mechanisms governing the photoconductivity of oxidized polycrystalline PbSe films by investigating the room-temperature dependence of the photoconductivity time constant τ_{ph} on the majority carrier (hole) density p in the range $3 \times 10^{16} - 10^{18} \text{ cm}^{-3}$. Measurements of τ_{ph} were made on samples with the Hall configuration so that the hole density was determined simultaneously. The time constant was deduced from the photoconductivity decay after a rectangular light pulse of 0.9μ wavelength supplied by a light-emitting diode. The dependences of the impurity photoconductivity on the energy of the incident radiation was investigated in order to detect the recombination level and to find its energy position in the band gap. (12 refs.)

114628 The influence of the hydrogen reduction process on the electrical properties of $\text{In}_2\text{O}_3/\text{Sn}$ thin films. T.Horodyski, K.Budzynska, A.Leja (Dept. of Solid State Phys., Acad. of Mining & Metal, Krakow, Poland).

Thin Solid Films (Switzerland), vol.106, no.3, p.195-202 (19 Aug. 1983). Highly degenerate thin $\text{In}_2\text{O}_3/\text{Sn}$ films were prepared by DC reactive sputtering of In-Sn alloy targets in Ar-O_2 mixtures with a wide range of oxygen concentrations. The influence of both the oxygen concentration in the reactive mixture and the tin content of the target on the structure and electrical properties was studied. Hall measurements indicate that ionized impurities and interphase boundaries play a dominant role as causes of carrier scattering. The effect of post-deposition heat treatment in vacuum and in hydrogen was also studied. The considerable increase in the carrier concentration during reduction in hydrogen is explained in terms of the reduction mechanism. (20 refs.)

114629 Electronic properties of grain boundaries in GaAs: a study of oriented bicrystals prepared by epitaxial lateral overgrowth. J.P.Salerno, R.W.McClelland, J.G.Mavroides, J.C.C.Fan (Lincoln Lab., MIT, Lexington, MA, USA), A.F.Witt. Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.375-82

The electronic properties of tilt boundaries with misorientation angles ranging from 0 to 30° in n-type GaAs bicrystal layers have been investigated. The current-voltage and capacitance-voltage characteristics are consistent with a double-depletion-region model. The height of the grain boundary potential barrier remains constant while the density of grain boundary states varies with misorientation angle. Deep level transient spectroscopy has revealed the presence of two bands of grain boundary states at approximately 0.65 and 0.9 eV below the conduction band. These states are attributed to bond reconstruction at the grain boundary. (20 refs.)

114630 Lowering of the breakdown voltage of silicon dioxide by asperities and at spherical electrodes. N.Klein, O.Nevanlinna (IBM Thomas J. Watson Res. Lab., Yorktown Heights, NY, USA).

Solid-State Electron. (GB), vol.26, no.9, p.883-92 (Sept. 1983). Examines the assumption that asperities and corners in electrodes can be preferential sites for electrical breakdown of silicon dioxide capacitors. It was assumed for this purpose that asperities can be approximated by spherical surfaces, and the breakdown voltage was then calculated at such asperities. Calculations showed that the breakdown voltage of a planar silicon dioxide capacitor can be lowered by one half to two thirds by asperities, when their radius is less than about one half of the oxide thickness. Such a decrease in the breakdown voltage is widely observed in polysilicon oxide capacitors. The effect of asperities is alleviated by a trapped electron charge, which can increase the breakdown voltage significantly. The spherical asperity model accounted for the breakdown voltages observed on a wide range of polysilicon oxide capacitors with oxide thicknesses varying from 45 to 820 nm. The radius of asperities responsible for breakdown in these experiments was roughly estimated 25-35 nm. (26 refs.)

74.00 SUPERCONDUCTIVITY

74.10 OCCURRENCE, CRITICAL TEMPERATURE

114631 Superconducting materials. M.Jergel, P.Hutka. *Elektrotech. Cas. (Czechoslovakia)*, vol.34, no.7, p.528-36 (1983). In Slovak. After a brief description of the principle of superconductivity and its most frequent applications, the developments of superconducting materials are dealt with. In particular, the properties of NbTi, Nb₃Sn and V₃Ga are discussed. Problems encountered in the fabrication of superconducting materials are illustrated with an example of Nb₃Ge. Amongst the topics discussed are stabilisation of the A-15 structure by means of gas additions and the presence of other Nb-Ge phases, selection of suitable substrates, the effects of technological conditions and the influence of the amorphous Nb-Ge. Future development trends discussed include materials based on carbonitrides, substances with crystalline hexagonal phase C15 (MgCr_2), chalcogenides based on ternary molybden sulphides, Chevrel phase materials and various types of palladium hydrides and deuterides. (4 refs.) E.D.

114632 ATA and the electron phonon coupling constant in calculating T_c of superconducting alloys. P.Chatterjee, S.Chatterjee (Dept. of General Phys. & X-rays, Indian Assoc. for the Cultivation of Sci., Calcutta, India).

Indian J. Cryog., vol.8, no.1, p.13-16 (1983). The theoretical formula of McMillan (1968) has been very successful in explaining the superconducting transition temperature. In this theory the electron-phonon coupling constant was very difficult to calculate from a purely theoretical standpoint until Gyorffy and Gaspari (1972) gave a theoretical formulation from the multiple scattering point of view. This theory has been very successful in explaining T_c of many superconducting elements and compounds. For the disordered solid, such as substitution alloys, this theory fails because of the breakdown of the translational symmetry used in the multiple scattering theory of Gyorffy and Gaspari. This problem can however be solved if the Green's function is averaged in random phase approximation (ATA). In this work Gyorffy and Gaspari's expression of the electron phonon coupling constant in the random phase approximation has been reformulated. This theory has been applied to alloys of Nb and Mo with different concentrations. (6 refs.)

114633 Structural phase transitions and superconducting transition temperatures of hexagonal M_xWO_3 compounds. M.Sato, B.H.Grier, H.Fujishita, S.Hoshino, A.R.Moodenbaugh (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

J. Phys. C (GB), vol.16, no.27, p.5217-32 (30 Sept. 1983). Neutron scattering experiments have been performed on non-stoichiometric compounds of the hexagonal tungsten bronzes M_xWO_3 ($\text{M}=\text{Rb}$ and K). A nearly dispersionless phonon branch has been observed in $\text{Rb}_{0.33}\text{WO}_3$ at an energy $\omega_M \approx 5.5 \text{ meV}$. This branch reflects the local-mode character of the Rb atoms, which are loosely trapped at their sites within the large channel along the c direction formed by the linkage of WO_6 octahedra. The x dependence of the energy ω_M of this low-lying phonon (LLP) has been determined by measurements of the peak position in the powder inelastic scattering spectra. Since ω_M depends only weakly on x , the variation in ω_M appears not to be related to the anomalous x dependences of the superconducting transition temperature T_c observed previously in Rb_xWO_3 and K_xWO_3 . Two kinds of structural phase transitions were observed using powder diffraction measurements. One transition, which takes place above room temperature at T_{c1} , is due to a distortion of the WO_3 host cage of M_xWO_3 . It is accompanied by an optical phonon softening at the Γ point. The second transition is an order-disorder transition of the M atoms. It produces for a certain value of x a long-wavelength incommensurate structure as the low-temperature phase. This is in contrast with the other incommensurate phases such as the CDW states of two-dimensional conductors, where the incommensurate structures generally appear at high temperatures. A local structural excitation model is adopted in the discussion of the superconductivity, and the x dependences of T_c in

Cs₈WO₃ and Rb₈WO₃ are consistently explained in relation to the ordering schemes of the M atoms. (34 refs.)

114634 Increase of transition temperature T_c in A15 superconductors after neutron irradiation. E.S.Plechkins, V.D.R.Radzhus, A.E.Petrov. *Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.41-5 (1983). In Russian.

The results of investigation of transition temperature T_c and transition widths T_c in A15 compounds Nb_{2.77}Ge_{1.23} and Nb₃Al_{0.7}Ge_{0.3} at the radiation temperature about 750K and fast neutron flow Φ up to 4×10¹⁸n/cm² are presented. The method of measuring T_c is described. The curve T_c(Φ) has a weak maximum for both the samples. The curve T_c(Φ) at radiation temperatures higher than 800K decreases monotonously with the fluence increase. The effect on T_c(Φ) is interpreted by the variations of the reduced density of electron states at the Fermi level due to structural defects. (8 refs.)

114635 Superconducting equiatomic ternary transition metal arsenides. G.P.Meisner, H.C.Ku (Inst. for Pure & Appl. Phys. Sci., Univ. of California, San Diego, La Jolla, CA, USA), H.Barz. *Mater. Res. Bull. (USA)*, vol.18, no.8, p.983-91 (Aug. 1983). The superconductivity and crystal structure of new transition metal arsenide compounds MM'As, where M=Zr or Hf and M'=Ru or Os, are reported. The ZrRuSi-type hexagonal structure of these compounds is metastable at low temperatures. The superconducting transition temperature of 12K for ZrRuAs is very high for an arsenide compound, and this is the first system of true ternary transition metal arsenides to exhibit superconductivity. (14 refs.)

114636 Superconductivity in irradiated charge-density-wave compounds 2H-NbSe₂, 2H-TaS₂, and 2H-TaSe₂. H.Mutka (Section d'Etude des Solides Irradies, CEN, Fontenay-aux-Roses, France). *Phys. Rev. B (USA)*, vol.28, no.5, p.2855-8 (1 Sept. 1983). Superconducting T_c can be increased by a low concentration, less than 1%, of irradiation-induced defects in the layered charge-density-wave (CDW) compounds 2H-NbSe₂, 2H-TaS₂, and 2H-TaSe₂. This is due to the pinning effect of the defects which perturbs the long-range coherence of the CDW. Resistive transitions show tails below a first drop, suggesting inhomogeneous superconductivity. Such effects are proposed to be related to CDW domains. (29 refs.)

114637 Role of monovalent anions in organic superconductors. J.M.Williams, M.A.Beno, J.C.Sullivan, L.M.Banovetz, J.M.Braam, G.S.Blackman, C.D.Carson, D.L.Greer, D.M.Loensing (Argonne Nat. Lab., Argonne, IL, USA), K.Carneiro. *Phys. Rev. B (USA)*, vol.28, no.5, p.2873-6 (1 Sept. 1983). From an analysis of the crystallographic structures of 13 (TMTSF)₂X salts (TMTSF, tetramethyl-tetraselenafulvalene and X, monovalent anion), at ambient temperature and 125K, the authors demonstrate that the interchain Se-Se contacts correlate well with the observed physical properties of the salts. This is in contrast with earlier and less complete analyses which have focused on unit-cell dimensions or intrachain contacts. (27 refs.)

114638 Appearance of localized superconductivity in magnetic field; possible percolation mechanism of conductivity. A.I.Buzdin (Phys. Dept., Moscow State Univ., Moscow, USSR), M.L.Kulic. *Solid State Commun. (USA)*, vol.47, no.11, p.913-16 (Sept. 1983). The case of a material with a small defect where the transition temperature is higher than in the bulk is studied. It is shown that localized superconductivity appears in magnetic field—in zero field it does not exist. The percolation mechanism as well as anisotropic character resistivity is studied. (9 refs.)

114639 Synthesis and physical properties of new superconducting Chevrel phases Hg₂Mo₆S₈. J.M.Tarascon, J.V.Waszcak, G.W.Hull,Jr., F.J.DiSalvo, L.D.Blitzer (Bell Labs., Murray Hill, NJ, USA). *Solid State Commun. (USA)*, vol.47, no.12, p.973-9 (Sept. 1983). New ternary molybdenum chalcogenides Hg₂Mo₆S₈ (0<x<1) have been synthesized and investigated for their structural, magnetic, and superconducting behavior. These new phases prepared at low temperature by reaction of mercury with Mo₆S₈ (obtained from oxidation of Cu₂Mo₆S₈ by iodine) have been characterized by X-ray diffraction, static Faraday susceptibility, and superconducting transition temperature studies. HgMo₆S₈ crystallizes in the rhombohedral space group R3 (a₀=6.51 Å, α₀=92.53°), has a paramagnetic, temperature dependent susceptibility, and superconducts at 8.1K. As the mercury content decreases, a continuous decrease in T_c from 8.1K to 1.7K for x=0 (Mo₆S₈) is observed. (17 refs.)

114640 Der Einfluss von Wasserstoff auf die Supraleitung von Nichtubergangsmetallen (The influence of hydrogen on the superconductivity of non-transition metals). F.Ochmann. *Report JUL-1849*, Kernforschungsanlage, Julich, Germany (May 1983), 47 pp. In German. The aim was to perform a systematic study of the hydrogen influence on the superconductivity of the non-transition elements Be, Zn, Cd, In, Sn, Tl and Pb. Since hydrogen is almost insoluble in these metals it was introduced into the host lattices by ion implantation at low temperatures. In all cases the critical temperature could be enhanced. In comparison the implantation of deuterium also lead to an improved superconductivity. The observed isotope effects are not understood. By implantation of He those effects on the critical temperature, which occur by radiation damage caused by H(D) implantation, were measured. The critical temperatures achieved in these experiments were always significantly smaller than those caused by H and D respectively. By an application of McMillan's theory (1968) it was possible to show that a phononic origin of the hydrogen effect can explain the experimental results. (44 refs.)

74.30 GENERAL PROPERTIES

114641 Nonlinear dynamics of resistive domains in inhomogeneous superconductors. A.Vi.Gurevich, R.G.Mints (Inst. of High Temperatures, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1037-8 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1103-5 (Dec. 1982). [received: Sept. 1983] The static properties, stability, motion, and localization of the resistive domains which arise as a result of Joule heating in superconductors with a transport current I have been investigated. However, the kinetics of the non-linear processes which accompany, for instance, the interaction between a moving domain and an inhomogeneity, the effect produced on a domain by perturbations of finite amplitude, the nucleation of a domain at an inhomogeneity, etc. have been practically unstudied. The purpose of this paper is to examine these problems. (9 refs.)

Electron-deformation currents in metalsSee Entry 114517

74.30C Magnetization curves, Meissner effect, penetration depth

114642 Superconducting behavior of amorphous Zr₇₀Cu₃₀. R.Arce, F.de la Cruz, J.Guimpel (Centro Atomico Bariloche, Bariloche, Argentina). *Solid State Commun. (USA)*, vol.47, no.11, p.885-7 (Sept. 1983). Measurement of the Meissner penetration depth, λ(T) were made in amorphous Zr₇₀Cu₃₀ samples. The results indicate that this amorphous alloy behaves as a BCS superconductor with 2Δ(0)/kT_c=3.8, where Δ(0) is the superconducting energy gap at T=0 and T_c the critical temperature. It is also concluded that the low energy excitation, TLS, characteristics of amorphous material does not contribute to T_c. (11 refs.)

74.40 FLUCTUATIONS AND CRITICAL EFFECTS

114643 The theory of the spin-spin relaxation of electron subsystem in antiferromagnets and polyenes. M.A.Savchenko, A.V.Stephanovitch (Inst. of Radioengng., Electronics & Automation, Moscow, USSR). *Solid State Commun. (USA)*, vol.47, no.11, p.863-8 (Sept. 1983). The theory of conductivity of rare earth compounds and polyenes is constructed on the basis of the fluctuational theory of magnetic superconductors. The criterion of the appearance of the high-temperature superconducting phase in rare earth antiferromagnetic compounds and of the superconductivity in polyene systems is found. (9 refs.)

74.50 PROXIMITY EFFECTS, TUNNELLING PHENOMENA, AND JOSEPHSON EFFECT

114644 Nb₃Al/oxide/Pb Josephson tunnel junctions fabricated using a CF₄ cleaning process. K.Tanabe, Y.Kato, O.Michikami (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan). *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.603-5 (15 Sept. 1983). Nb₃Al/oxide/Pb Josephson tunnel junctions have been fabricated using a new surface cleaning technique, the CF₄ cleaning process (CFCP), in which the base electrode is cleaned prior to oxide barrier formation in an Ar and CF₄ RF plasma mixture. Adopting lower cleaning voltages than for Nb/oxide/Pb junctions, makes it possible to obtain high-quality junctions with very low leakage (V_m=30 mV) and uniform Josephson current distribution. Such good junction characteristics indicate the formation of damage-free cleaned electrode surfaces and highly insulating mixed oxide barriers. (14 refs.)

114645 Nb₃Sn-Pb Josephson tunnel junctions using patterned RF sputtered material and RF oxidation. H.Tsuge, L.L.Houck, J.E.Nordman (Dept. of Electrical & Computer Engng., Univ. of Wisconsin, Madison, WI, USA). *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.606-8 (15 Sept. 1983). Josephson tunnel junctions have been fabricated using standard photolithography and RF plasma oxidation on RF sputtered Nb₃Sn films. Good quality Nb₃Sn surfaces have been obtained by evaporating a Sn layer of 50-70 nm on the Nb₃Sn films and annealing at 800-850°C in a high vacuum. The measured energy gap values for the Nb₃Sn films are between 3.0 and 3.1 meV. The subgap resistance is more than six times the normal resistance. A significant improvement in tunnel characteristics can be achieved by using this surface treatment process on sputtered Nb₃Sn films. (8 refs.)

114646 Lead-lead oxide-lead tunnel junction fabrication technique and performance. M.Prasad, A.K.Gupta, V.S.Tomar, N.D.Kataria (Nat. Phys. Lab., New Delhi, India). *Indian J. Cryog.*, vol.6, no.4, p.192-5 (1981).

Preparation of thin film (tunnel) junctions suitable for Josephson voltage standard application needs several considerations. Such junctions should show large amplitude microwave induced steps up to a few millivolts. In other words, the junction should have better microwave coupling which is achieved by mounting the junction in a resonant field and by having the junction dimensions suitable for such resonance. Lead-lead oxide-lead tunnel junctions of dimensions 0.2×0.2 mm² and 0.2×0.8 mm² are prepared in cross type geometry. The evaporation of lead is done through a precise pattern mask prepared photolithographically. Oxidation of the film is done in situ. The oxide barrier thickness is very critical for Josephson behaviour and has aging effects at ambient temperatures. I-V characteristics of typical junctions are presented and discussed. (5 refs.)

114647 Fluxon reflection at loaded terminations of long Josephson junctions. O.H.Olsen (R&D System & Design Div., NIRO Atomizer, Soeborg, Denmark), M.Salerno, M.R.Samuelsen. *Physica D (Netherlands)*, vol.8D, no.1-2, p.267-72 (July 1983). The reflection process of fluxons at loaded terminations of long lossless Josephson junctions is examined numerically. The energy absorbed by the load, modelling an external circuit, is calculated and compared to an approximate analytical expression. Further an estimate of the energy of the radiation into the junction resulting from the reflection is calculated. The absorbed energy and the energy of the radiation increase linearly and quadratically with the reciprocal load, respectively. (6 refs.)

114648 Electric-field penetration into a superconductor in a Josephson microjunction. L.E.Amatuni, V.N.Gubankov, A.V.Zaitsev, G.A.Ovsyannikov (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1070-6 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1851-63 (Nov. 1982). [received: Sept. 1983]

The influence of penetration of a constant and alternating field into the superconducting films of the electrodes (banks) on the properties of individual Josephson junctions and of their chains is investigated theoretically and experimentally. It is found that these phenomena are of substantial significance despite the considerable current density in the film junctions. It is shown that the interaction efficiency of series-connected junctions has a non-monotonic dependence on the distance between them, on the chain voltage, and on the temperature; this is due to the quasiwave character of the propagation of the alternating electric field in the film of the superconducting electrodes. 114649 Unusual critical-field behavior in $Y_{1-x}Er_xRh_4B_4$. H.B.Radousky, A.T.Aldred, G.S.Knapp, J.S.Kouvel (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).

Phys. Rev. B (USA), vol.28, no.5, p.2859-62 (1 Sept. 1983).

Measurements of the upper critical fields versus temperature in $Y_{1-x}Er_xRh_4B_4$ reveal that the system undergoes a nearly abrupt change from very weak to very strong pair breaking in an applied field with increasing Er concentration. This abrupt change in behavior occurs for $0.10 < x < 0.17$, and can be characterized by the relative variation of the magnetic correlation length ξ_{sc} , which are the relevant length scales for this problem. (19 refs.)

114650 Critical field measurements in superconductors using AC inductive techniques. S.A.Campbell, J.B.Ketterson (Argonne Nat. Lab., Argonne, IL, USA), G.W.Crabtree.

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1191-8 (Sept. 1983).

The AC in-phase and out-of-phase response of type II superconductors is discussed in terms of DC magnetization curves. Hysteresis in the DC magnetization is shown to lead to a dependence of the AC response on the rate at which an external field is swept. This effect allows both H_{c1} and H_{c2} to be measured by AC techniques. A relatively simple mutual inductance bridge for making such measurements is described in the text, and factors affecting bridge sensitivity are discussed in the Appendix. Data for the magnetic superconductor $ErRh_4B_4$ obtained using this bridge are reported. (15 refs.)

114651 50-Hz AC losses in inductive coils with mixed matrix fine filament NbTi composites at fields up to 1 T. I.Hlasnik, E.W.Seibt (Inst. fur Tech. Phys., Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).

J. Appl. Phys. (USA), vol.54, no.9, p.5479-81 (Sept. 1983).

Measurements of 50-Hz AC losses were performed using three characteristic NbTi coil samples with ultrafine filaments and a Cu-CuNi mixed matrix at fields up to 1 T and 4.2K. Critical current and quenching current densities were measured under DC and AC conditions as well as the losses with their hysteresis and eddy current loss proportions. To characterize the samples by their eddy current loss proportions the transverse resistivity of the matrix ρ_{trans} was determined. The results for losses show that under 50-Hz AC loads alternating fields up to approximately 1 T are attained without quenching. The fact that the associated eddy current losses of about 10^3 W/m³ remain comparatively low at 0.5 T and 4.2K opens up for such structured mixed matrix NbTi composites a novel field of application for superconducting generators and pulsed magnets with 50-60 Hz fed windings. 114652 Some ideas related to magnetism in the rare earths. S.Legvold (Dept. of Phys., Iowa State Univ., Ames, IA, USA).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.1-14 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

In 1962 it was found that rare earth metal single crystals could be grown by the strain anneal method. This breakthrough made it possible to obtain illuminating magnetic and transport data on these metals. The author gives a brief summary of some of the results obtained and then discusses some more recent findings about Lifshitz points, 'double' ferromagnetism and the suppression of superconductivity in lanthanum by the magnetic rare earths. 114653 Transport properties of nearly magnetic alloys and metals. A.B.Kaiser (Phys. Dept., Victoria Univ. of Wellington, Wellington, New Zealand).

Aust. J. Phys. (Australia), vol.36, no.4, p.537-51 (1983).

The author gives an elementary review of how simple spin fluctuation models can account for the distinctive transport properties of nearly magnetic alloys and metals. The principal systems considered are dilute alloys such as $PdNi$ in which host and impurity have somewhat similar electronic structure but with the impurity more nearly magnetic than the host. Similar effects occurring in pure metals or concentrated alloys are also mentioned. (44 refs.)

114654 Magnets with random anisotropies: the random cubic model and other models with p -fold spin interactions. Y.Y.Goldschmidt (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA). *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.351-65 (5 Sept. 1983).

The author investigates in detail models with random anisotropies and p -fold spin interactions. He constructs the random cubic model ($p=4$) and shows that when $N>2$ (N being the number of spin components) its properties are similar to the random uniaxial anisotropy model, since quartic interactions characteristic of the random uniaxial model, are generated through renormalization even if they vanish to start with. Similar conclusions apply to a random p -fold interaction model of the form $-\Delta\sum_i(\hat{n}_i\cdot\hat{S}_i)^p$, when p is even. In the case of odd p , a random field interaction is generated. Other models are also discussed. (13 refs.)

114655 Competing Ising interactions and chaotic glass-like behaviour on a Cayley tree. S.Inawashiro, C.J.Thompson (Dept. of Math., Univ. of Melbourne, Parkville, Australia). *Phys. Lett. A (Netherlands)*, vol.97A, no.6, p.245-8 (5 Sept. 1983). For the Ising model on a Cayley tree with competing nearest neighbour coupling J and next nearest neighbour coupling J' , the authors find in addition to the expected paramagnetic, ferromagnetic and antiferromagnetic phases, an intermediate range of $J'/J<0$ values where the local magnetization has chaotic oscillatory glass-like behaviour. 114656 Magnetic ordering phenomena in rare earth semiconductors. W.Zinn (Inst. fur Festkörperforschung KFA, Jülich, Germany). *Acta Polytech. Scand. Electr. Eng. Ser. (Finland)*, no.EL50, p.365-446 (1983). (Proceedings of Helsinki International Summer School on Semiconductors 1982, Espoo, Finland, 14-18 June 1982). The general features of 4f-magnetic semiconductors are introduced by outlining their most characteristic properties in comparison to those of the 5f-actinide and chalcogenide classes of binary compounds. An overview on the $\text{EuX(X=0, S, Se, Te)}$ model substances for the Heisenberg theory of exchange and ferromagnetism is given. In particular, recent systematic neutron scattering, NMR, and Mossbauer effect studies on correlations between the individual exchange interactions, $-2J\text{S}_i\text{S}_j$, and attributed transferred hyperfine interactions, $A_{ij}\text{I}_i\text{S}_j$, between an Eu^{2+} ion of 4f-spin S_0 and nuclear spin I_i and an Eu-ion of spin S_i in the i -th neighbour shell, respectively are discussed. These results are shown to provide a good quantitative basis for detailed further experimental and theoretical studies of frustration and spin glass phenomena observed generally on disordering or diluting spin systems, which are coupled by competing exchange interactions. These features are demonstrated by results of recent systematic neutron scattering experiments on the spin structures, correlation lengths, and magnetic excitation spectra of the magnetic phases observed in $\text{Eu}_x\text{Sr}_{1-x}\text{S}_y\text{Se}_{1-y}$ compounds, which are considered model systems for disordered and diluted Heisenberg ferromagnets and spin glasses. 114658 Mean-field solution of a spherical model for Heisenberg spins with complicated coupling. K.G.Chakraborty (Dept. of Phys., Basirhat Coll., West Bengal, India). *Phys. Rev. B (USA)*, vol.28, no.5, p.2827-38 (1 Sept. 1983). Mean-field solution of a spherical model for complicated magnetic systems is presented. The magnetic systems include those which favor dipolar, quadrupolar, and biaxial ordering. The author employs a Lagrange multiplier method to calculate the partition functions of the systems and hence the expressions for the ordering parameters. The phase transitions of the model systems are studied and the results are compared with those obtained by earlier approximation methods. (21 refs.)

114659 Exact solution of the Bethe lattice with long-range interactions: Application to a Heisenberg ferromagnet. A.Trias, F.Yndurain (Dept. de Fisica, Univ. Autonoma de Madrid, Madrid, Spain). *Phys. Rev. B (USA)*, vol.28, no.5, p.2839-44 (1 Sept. 1983). The authors have found the exact solution for the density of states of a tight-binding Hamiltonian describing the interactions between orbitals (spins, atomic orbitals, atomic displacements, etc.) in atoms on a Bethe lattice. These interactions are not necessarily restricted only to near-neighbor atoms because long-range interactions between distant atoms are included. A dispersion relations characteristic of the Bethe lattice appears very naturally in the solution. As an example, the dispersion relation in the one-spin-wave approximation for a ferromagnetic Heisenberg Hamiltonian is calculated. A Ruderman-Kittel-Kasuya-Yosida-type interaction between all pairs of spins is considered. The authors find that when the interaction between spins decays with the distance at a slower rate than a critical value, the ferromagnetic ground state is unstable and a new helical spin array appears. (11 refs.)

114660 Itinerant electron magnetism. E.P.Wohlfarth (Imperial Coll., London, England). *Europhys. News (Switzerland)*, vol.14, no.7, p.7-8 (July 1983). Itinerant electron magnetism as a subject had its birth in the 1930s and, after a lengthy period of relative neglect, it experienced a renaissance beginning about 20 years ago. At the present time it has reached an exciting stage of development to which there is no rapid end in sight. Contributing to the evolution of the subject, concerned as it is with the magnetic properties of metals and alloys are: theoretical sophistication, advanced computations and advances in experimental techniques. All three of these facets appeared in an

exciting way at a recent Workshop on 3d metallic magnetism, held in Grenoble on 25-26 March, 1983, and at the 3rd General Conference of the Condensed Matter Division in Lausanne. (no refs.)

114661 Strong electronic correlations in magnetic semiconductors: the functional integral approach to the Hubbard model. P.L.Hugon, D.Paquet (Univ. Paris VII, Paris, France). *Acta Polytech. Scand. Electr. Eng. Ser. (Finland)*, no.EL50, p.139-82 (1983). (Proceedings of Helsinki International Summer School on Semiconductors 1982, Espoo, Finland, 14-18 June 1982).

Discusses magnetic semiconductors in the intermediate-coupling situation within the framework of the Hubbard model. The experimental facts which motivate the recourse to the Hubbard model are recalled and the model itself is introduced. The standard treatment of the Hubbard model in terms of the functional integral is discussed with emphasis on the series of approximations which underlie it. The thermodynamics of the half-filled Hubbard system is discussed by introducing a functional order parameter which is the probability density of exchange field on a site. For large values of the intra-atomic interaction energy U , a cross-over temperature separates a low temperature regime, exhibiting quasi-local magnetic moments and non-conducting states at the Fermi level, from a high temperature regime characterized by spin-fluctuations in a poor metal. It is shown how the functional integral formalism lends itself to estimate the linear responses of the system. The magnetic susceptibility evolves continuously from a Curie-Weiss behaviour (large U , small T) to an enhanced Pauli one (small U , large T). Finally, results regarding the exchange field dynamics are given. (34 refs.)

114662 Band-model approach to magnetic excitations in a disordered ferromagnet: one-dimensional case. S.Krompiewski (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland). *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1092-4 (19 Sept. 1983). A disordered ferromagnet is studied with use of the Hubbard model. A systematic method of finding the spin transverse susceptibility for any random configuration is developed. The computer results for a one-dimensional case reveal gapless magnetic excitations centered around a wave vector corresponding to the first maximum of the structure factor in qualitative accordance with recent experimental data. 114663 Magnetic susceptibility of solid solutions based on two isostructural SmB_6 phases. M.I.Aivazov, S.V.Aleksandrovich, B.A.Evseev, O.M.Tsarev (Sci.-Production Combine 'Energiya', Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.249-52 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. The magnetic susceptibility of the $\text{Sm}_{1-x}\text{Pr}_x\text{B}_6$, $(\text{Sm}_{1-x}\text{Gd}_x)_{0.8}\text{B}_6$, and $(\text{Sm}_{1-x}\text{Eu}_x)_{0.8}\text{B}_6$ solid solution systems was determined in the temperature range 80-1100K. At low Sm concentrations the values of the Weiss constants were in agreement with the predictions of the RKKY theory of indirect exchange via the conduction electrons. The magnetic susceptibility and the lattice period data were used to determine the valence of ions in the isostructural SmB_6 and $\text{Sm}_{0.8}\text{B}_6$ phases. (12 refs.) *A.T.*

114664 Field dependence of the paramagnetic susceptibility of the antiferromagnets $\text{CoCl}_2\cdot 6\text{H}_2\text{O}$, $\text{NiCl}_2\cdot 4\text{H}_2\text{O}$, $\text{MnCl}_2\cdot 4\text{H}_2\text{O}$, and $\text{MnBr}_2\cdot 4\text{H}_2\text{O}$. S.S.Vianna (Dept. de Fisica, Univ. Federal de Pernambuco, Pernambuco, Brazil), C.C.Becerra. *Phys. Rev. B (USA)*, vol.28, no.5, p.2816-26 (1 Sept. 1983). Reports differential paramagnetic susceptibility (χ) measurements as a function of an applied magnetic field (H) for the antiferromagnets $\text{CoCl}_2\cdot 6\text{H}_2\text{O}$, $\text{NiCl}_2\cdot 4\text{H}_2\text{O}$, $\text{MnCl}_2\cdot 4\text{H}_2\text{O}$, and $\text{MnBr}_2\cdot 4\text{H}_2\text{O}$. Above the ordering temperature, the χ vs H curves exhibit a characteristic maximum which is attributed to short-range order. This effect is more pronounced in the cobalt compound (spin $1/2$) and less pronounced in the manganese compounds (spin $5/2$). Using simple models suitable to describe the above-mentioned systems, they discuss the dependence of this maximum with spin magnitude, anisotropy, and lattice dimensionality. The theoretical treatment is based on a variational method in which correlation effects between pairs of spins are considered. (23 refs.)

114665 Magnetism in Ti_6O_{11} . S.P.McAlister, A.D.Inglis (Solid State Chem., National Res. Council of Canada, Ottawa, Ontario, Canada). *Solid State Commun. (USA)*, vol.47, no.11, p.931-3 (Sept. 1983). Measurements of the magnetization of Ti_6O_{11} show transitions of $119\pm 1\text{K}$ and $147\pm 1\text{K}$. Above 147K the authors attribute the paramagnetism to d^1 electrons on Ti^{3+} ions. Below 147K there are contributions from both Ti_2^{7+} dimers and Ti^{3+} ions. The gradual increase in magnetic moment with increasing temperature to 119K the authors interpret as an increase in spins due to the break up of Ti_2^{6+} dimers to Ti^{3+} ions. (13 refs.)

114666 Nonlinear static magnetic susceptibility of the Van Vleck paramagnet TiMPo_4 . S.I.Andronenko, A.N.Bazhan, I.A.Bondar, V.A.Ioffe, B.Z.Malkin, L.P.Mezentseva (I.V. Grebenshchikov Inst. of Silicate Chem., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.239-42 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.423-9 (Feb. 1983). [received: Sept. 1983]

A theoretical and experimental study is made of the anisotropy, temperature dependence, and field dependence of the magnetic moment of Ti^{3+} ions having a singlet ground state in the TiMPo_4 lattice, at temperatures from 2 to 50K in fields up to 65 kOe. It is shown that the anomalously large nonlinear static magnetic susceptibility found in the [110] direction is due to the inverse magnetostriiction effect and cooperative quadrupole-quadrupole interaction in rare-earth ions via the field of deformations with B_2 symmetry. 75.20E Metals and alloys

114667 Magnetic properties of Fe-Ni-Zr and Fe-Ni-Nb alloys. L.V.Osipova, L.A.Panteleymonov. *Russ. Metall. (GB)*, no.3, p.183-5 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.205-7 (1982). Compounds FeZr_2 , NiZr_2 , Ni_2Zr , Fe_2Nb , FeNb , NiNb and Ni_2Nb are paramagnetic under normal conditions, while the intermetallics Fe_2Nb , FeNb , NiNb and Ni_2Zr are temperature-independent paramagnetics in the range 293-1073K. The Laves phase Fe_2Zr is ferromagnetic with the Curie point at 370K. Alloying of Fe_2Zr -base alloys with nickel causes a drop in transition temperature into the magnetically ordered state. The addition of 27 at.% Ni leads to complete loss of the ferromagnetic properties of alloys from the range of ternary solid solution $\text{Fe}_{2-x}\text{ZrNi}_x$. (8 refs.)

114668 Inelastic scattering of neutrons by paramagnetic ions under relaxation conditions. V.N.Peregudov, A.M.Afanasyev, V.D.Gorobchenko (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1059-63 (Nov. 1982). Translation of: *Zh. Eksp. i Teor. Fiz. (USSR)*, vol.83, no.5, p.1831-40 (Nov. 1982). [received: Sept. 1983]

A general theoretical analysis is made of the inelastic scattering of neutrons by paramagnetic ions interacting with the environment. A situation is considered in which a paramagnetic ion interacts statically with a crystal field and the total angular momentum of a partly filled electron shell of the ion relaxes because of the contact interaction with conduction electrons. A detailed calculation is made of inelastic scattering of neutrons in an intermetallic compound PrAl_2 at low temperatures. Analytic expressions are obtained for the profiles of the inelastic scattering peaks and for the temperature dependences of the peak parameters. It is shown that the interaction of the f electrons of Pr with the conduction electrons broadens and shifts the peaks corresponding to transitions between the f -electron states in a crystal field, and also splits the peaks and makes them asymmetric. 114670 Investigations on the magnetic structure of pseudobinary intermetallic compounds from the $\text{Tb}(\text{Co}_x\text{Ni}_{1-x})_2$ system. B.Sidzhimov (Inst. of Nuclear Res. & Nuclear Energy, Bulgarian Acad. of Sci., Sofia, Bulgaria), N.Stanev, L.Bozakov, S.Neov. *Bulg. J. Phys. (Bulgaria)*, vol.10, no.3, p.328-36 (1983).

Neutron diffraction and magnetic measurements by a vibrating magnetometer in the 78-293K range were used to study the magnetic structure of the intermetallic compounds $\text{Tb}(\text{Co}_x\text{Ni}_{1-x})_2$ prepared by arc melting. The studied compounds were found to crystallize in a MgCu_2 -type cubic lattice. The unit cell parameters and the atomic radii were calculated as a function of composition and nearest neighbour's distances in the structures of the investigated compounds. The Curie temperature were found from the temperature dependence of the bulk magnetization. The neutron diffraction patterns below T_C show antiparallel alignment of the magnetic moments in the two sublattices. The sublattice and molecular magnetic moments were found for each of the studied compounds in magnetically ordered state. (17 refs.)

114671 Magnetic structure of Tb_3Co . N.V.Baranov, A.P.Vokhmyanin, A.V.Deryagin, V.V.Kelarev, A.N.Pirogov, V.A.Reimer, V.N.Syromyatnikov (A.M. Gorki Ural State Univ., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.261-5 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A neutron-diffraction study was made of an intermetallic compound Tb_3Co at 4.2 and 300K. The parameters describing its magnetic structure were determined. It was found that the noncoplanar nature of the magnetic moments of the Tb ions was mainly due to the electrostatic interaction of their 4f shell with the crystal field of the lattice. (9 refs.) A.T.

114672 Magnetic ordering of the quasi-two-dimensional system VOCl . A.Wiedenmann (Inst. fur Phys. Chem., Univ. Hamburg, Hamburg, Germany), J.P.Venien, P.Palvadeau, J.Rossat-Mignod. *J. Phys. C (GB)*, vol.16, no.27, p.5339-50 (30 Sept. 1983).

The susceptibility of single crystals of VOCl is isotropic above $T_N=80.5\text{K}$ and well described by a quadratic two-dimensional (2D) Heisenberg system with a strong antiferromagnetic intra-layer coupling ($J/k=-34.5\text{K}$). Neutron diffraction revealed a collinear antiferromagnetic order with a wavevector $k=[1/2, 1/2, 1/2]$ and the moments along the a axis. Two structures, corresponding to both a ferromagnetic and an antiferromagnetic coupling between the two magnetic Bravais lattices, coexist as a result of the particular value of the wavevector. The order parameter follows a power law at the magnetic transition, with a critical exponent $\beta=0.143$, in agreement with the 2D character and anisotropy of Ising type. (12 refs.)

114673 The magnetic structures of the rare earth metals—a historical survey. W.C.Kochler (Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.15-30 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Presents a brief survey of the magnetic structure determination in rare earth metals using neutron diffraction. Studies of both paramagnets and magnetically ordered phases are included. (37 refs.)

114674 Modulated magnetic structure of the Kondo compound TmS . Y.Lassailly, C.Vettier (Inst. Laue-Langevin, Grenoble, France), F.Holtzberg, J.Flouquet, C.M.E.Zeyen, F.Lapierre. *Phys. Rev. B (USA)*, vol.28, no.5, p.2880-2 (1 Sept. 1983).

Single-crystal neutron-diffraction experiments have revealed a modulated antiferromagnetic structure in TmS below the Neel temperature $T_N=5.2\text{K}$. At 1.5K the propagation vector \vec{q} is $(1/2-\eta, 1/2+\eta, 1/2)$ with $\eta=0.075$ and the modulation amplitude $3.4 \mu_B$ along the $[112]$ direction. No lock-in transition is observed even when hydrostatic pressure up to 16 kbar is applied. While the magnetic-transition temperature increases under pressure, the modulation amplitude appears to be pressure independent. Comparison is made with CeAl_2 and other chalcogenide Tm compounds. (16 refs.)

114675 Ferrimagnetism in the MnCrG-MnFeG garnet solid solution system. S.A.Bogoslovskii, T.V.Valyanskaya, I.V.Golosovskii, V.P.Plakhtii, O.P.Smirnov, V.I.Sokolov. *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.185-7 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.328-33 (Feb. 1983). [received: Sept. 1983]

Magnetic, calorimetric, and neutron diffraction studies of the $\text{Mn}_3\text{Fe}_x\text{Cr}_{2-x}\text{Ge}_3\text{O}_{12}$ ($0 \leq x \leq 2$) garnets, which are solid solutions of the antiferromagnetic garnets $\text{Mn}_3\text{Fe}_2\text{Ge}_3\text{O}_{12}$ and $\text{Mn}_3\text{Cr}_2\text{Ge}_3\text{O}_{12}$, were carried out at liquid helium temperatures. It was found that samples with $0.25 \leq x \leq 1.5$ show a special kind of ferrimagnetic order. The experimental results indicate that the mixed-composition garnets contain states of the ferrimagnetic spin glass type. (12 refs.)

75.30C Saturation moments and magnetic susceptibility

114676 A reexamination of the magnetic susceptibility of the coordination complex $\mu_4\text{-oxohexa-}\mu\text{-chlorotetrakis-(triphenylphosphine oxide) copper (II), Cu}_4\text{OCl}_6(\text{TPO})_4$. R.D.Dickinson, W.A.Baker, Jr. (Dept. of Chem., Univ. of Texas, Arlington, TX, USA), T.D.Black, R.S.Rubins. *J. Chem. Phys. (USA)*, vol.79, no.6, p.2609-14 (15 Sept. 1983).

High purity samples of Cu_4OCl_6 (triphenylphosphine oxide), have been prepared for a reexamination of the χ vs. T behavior of this compound. EPR studies on single crystals of the compound have revealed the ground state to be $S'=0$ and an observed spectrum from an excited $S'=2$ manifold with a g factor of 2.10 ± 0.01 . The ordering of the energies of the spin manifolds is proposed to be $S'=0, S'=2, S'=1$. On this basis, experimentally determined χ vs. T data were fitted to a modified Heisenberg exchange model for $g=2.10, E(S'=1)-E(S'=0)=85 \pm 13 \text{ cm}^{-1}, E(S'=2)-E(S'=0)=10 \pm 1 \text{ cm}^{-1}$, and $z'J'=0 \pm 1 \text{ cm}^{-1}$. Magnetic susceptibility measurements were also made on samples prepared by 'doping' the tetramer into the pores of a cross-linked polymer. (35 refs.)

114677 Magnetochemical study of iron molybdates obtained from precursor precipitates with different Mo- and Fe-content. S.Angelov, St.Karagiozova, K.Petrov (Inst. of General & Inorganic Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria). *Mater. Res. Bull. (USA)*, vol.18, no.8, p.909-14 (Aug. 1983).

The calcination, above 350°C , of precursor precipitates with well-defined stoichiometry and different fixed Mo-to-Fe ratios leads to the formation of undistinguishable, by X-ray diffractometry, crystal iron molybdates. At Mo-to-Fe ratios higher than 1.5 a phase of MoO_3 appears. The parameters describing the temperature dependence of the magnetic susceptibility and the EPR-lines belonging to the iron molybdates depend on the initial-precipitate composition. This is an evidence for the presence of some structural differences in iron molybdate phases. (10 refs.)

114678 Concentration and temperature dependences of the magnetic susceptibility of binary alloys of indium with potassium and rubidium. L.Z.Melekhov, S.P.Yatsenko, K.A.Chuntanov, Sh.R.Zhakupov. *Russ. Metall. (GB)*, no.3, p.179-82 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.202-4 (1982).

The concentration and temperature dependences have been obtained for the magnetic susceptibility of In-K and In-Rb alloys. The concentration characteristics are satisfactorily explained by a model in which the presence of quasimolecules is assumed. The composition dependence of the quasimolecule distribution has been plotted for In-K alloys. The susceptibility polytherms in the liquid homogeneous range are represented in the form $\chi=aT+b$. (9 refs.)

114679 Noncollinear magnetic phases in a strongly anisotropic antiferromagnet CoF_2 with large Dzyaloshinskii interaction. K.G.Gurtovoi, A.S.Lagutin, V.I.Ozhogin (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1122-9 (Nov. 1982). Translation of: *Zh. Eksp. i Teor. Fiz. (USSR)*, vol.83, no.5, p.1941-54 (Nov. 1982). [received: Sept. 1983]

The magnetization and differential magnetic susceptibilities are measured in a field H up to 500 kOe directed along the U_2 and C_4 axes of the tetragonal crystal CoF_2 . Antiferromagnetic resonance in the wavelength range from 1 to 8 mm is also investigated at $H \parallel C_4$. Softening of one of the AFMR modes in a field $H_{c1}=210 \text{ kOe}$ is observed, as well as a jump of the magnetic moment in a field $H_{c2}=255 \text{ kOe}$ when the field deviates from the C_4 axis by an angle not more than 30° . The phenomena are interpreted on the basis of a model in which it is assumed that at field strengths between H_{c1} and H_{c2} there exists a canted phase in which the sublattice moments make various angles with the C_4 axis. The magnetization curves for CoF_2 , which has an exceptionally high single-ion magnetic anisotropy, are calculated on the basis of a semiphenomenological theory within the framework of the model in a longitudinal and a transverse field. Satisfactory agreement with the measured magnetization curves is obtained. (31 refs.)

114680 Gap surface waves in magnetic materials. I.A.Gilinskii, I.M.Shecheglov (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.234-8 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A theoretical study is made of surface magnetostatic waves in a system of two different magnetic materials separated by an insulating gap. An allowance is made for the exchange interaction. It is shown that two branches of surface oscillations are possible. The emission of bulk magnons does not occur in the case of the low-frequency branch at long wavelengths. (7 refs.) A.T.
114681 Influence of the domain structure on the magnetostatic-oscillation spectrum of a ferrite plate. S.A.Vyzulin, S.A.Kirov, N.E.Syr'ev (Dept. of VHF Radiophys., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.111-14 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.92-4 (1983).
The resonant frequencies of long-wave magnetostatic oscillations are calculated theoretically for a plate of a cubic magnet ($K_1 < 0$) with a two-phase domain structure in the case of magnetization along the axis [110]. In the range 0.4-1.85 GHz, the spectrum of a YIG plate was investigated experimentally. Good agreement of theory and experiment is obtained both in the saturation region and in the field range where there is two-phase plate domain structure. (6 refs.)

114683 Magnetic crystallographic anisotropy of the ferrimagnetic iron oxide $\gamma\text{-Fe}_2\text{O}_3$. E.V.Babkin, K.P.Koval', V.G.Pyn'ko (L.V. Kirenskii Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.3320-3 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.585-7 (Feb. 1983). [received: Sept. 1983]
In order to determine how a crystalline field of cubic and axial symmetry affects the magnetic crystallographic anisotropy of $\gamma\text{-Fe}_2\text{O}_3$ the authors have studied the temperature dependence of the first constant K_1 of magnetic crystallographic anisotropy of $\gamma\text{-Fe}_2\text{O}_3$ single-crystal films. To find the parameters of the crystalline field they employed a traditional device based on comparison of the experimental and theoretically calculated functions $K_1(T)$ for known values of the sublattice magnetizations. The latter were determined from the experimentally measured temperature dependence of the saturation magnetization of ferrite. (9 refs.)

75.30H Magnetic impurity interactions

114684 Nonmagnetic state of cobalt ions in chromium alloys. E.I.Kondorskii, K.I.Kostina, N.V.Trubitsina, I.V.L'vova (M.V. Lomonosov State Univ., Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.396-8 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The magnetic properties of Cr-Co alloys with up to 10 at.% Co were investigated in fields up to 10^5 A/m at temperatures 4.2-450K. The magnetic susceptibility was determined in the range 77-450K by the Faraday method. The field dependences of the magnetization at 4.2K were found by the compensation ballistic method, whereas in weak fields a vibration magnetometer was employed. The results indicated that the cobalt ions had zero magnetic moment right up to 6 at.%; above this concentration the magnetic moment was two orders of magnitude less than the effective magnetic moment per iron ion in Cr-Fe alloys. (4 refs.) A.T.

114685 Spin glasses in transition?. T.J.Hicks (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia). *Aust. J. Phys. (Australia)*, vol.36, no.4, p.519-36 (1983).
Spin glasses have variously been described as apparently frozen but very slowly relaxing spin systems, and also as magnetic phases below a second order transition. The structural and dynamic properties of metallic spin glasses are surveyed with emphasis on neutron scattering and low field magnetic measurements. Spin glass regions in phases with magnetic long range order are included, and an attempt is made to assess spin glass theories with respect to the various transitions. (35 refs.)
114686 Orientational phase diagram of cubic magnetic materials derived allowing for eighth-order anisotropic interactions. V.A.Borodin, V.D.Doroshchikov, T.N.Tarasenko (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.220-5 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
A calculation is made of the orientational phase diagram of a cubic magnetic material allowing for anisotropic interactions of the fourth, sixth, and eighth orders (using magnetocrystalline anisotropy constants K_1 , K_2 , and K_3). The ranges of stability of symmetric and canted magnetic phases and the nature of spontaneous spin-reorientation phase transitions are determined. (14 refs.) A.T.
114687 Labile magnetic state in the spin-reorientational transition in magnetite. K.P.Belov, A.N.Goryaga, L.A.Skipetrova, V.N.Pronin, R.V.Senina (Dept. of General Phys. for Natural Faculties, Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.37, no.5, p.119-21 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.101-3 (1982).
It is established that in magnetite, in the vicinity of the spin-reorientational transition, the spin system is unstable not only with respect to strong, but also to weak, external perturbations. An analysis of the results on magnetization, magnetocaloric effect, magnetic permittivity, and specific heat leads to the conclusion that the spin-reorientational transition $\Phi(111) \rightleftharpoons \Phi(100)$ in magnetite at low temperatures occurs without spinodal decay. (8 refs.)
114688 Magnetic properties and the magnetic phase diagram of the $\text{Cr}_{1-x}\text{Ni}_x\text{S}$ system. G.I.Makovetskii, K.I.Yanushkevich, E.A.Vasil'ev, A.V.Shablovskii (Inst. of Solid-State & Semiconductor Phys., Acad. of Sci., Minsk, Belorussian SSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.285-8 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.506-11 (Feb. 1983). [received: Sept. 1983]
The effect of cationic substitution on the properties of solid solutions in the $\text{Cr}_{1-x}\text{Ni}_x\text{S}$ system is discussed. Measurements of the magnetic susceptibility and Mossbauer spectra show that, for chromium sulfide, $T=460\text{K}$ is an intermediate phase transformation temperature of the spin reorientation type, the transition from antiferromagnet to paramagnet occurring at $T_N=860\text{K}$. It is also shown that the compositions with $0.2 \leq x \leq 0.7$ have an uncompensated magnetic moment. The effective magnetic fields at ^{57}Fe nuclei in cationic positions are determined, and are found to be zero for nuclei at anionic sites. The magnetic phase diagram of the system is plotted. (12 refs.)
114689 Theory of ferromagnetism of metallic glasses. I.A.Akhiezer (Physicotech. Inst., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.308-10 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.547-51 (Feb. 1983). [received: Sept. 1983]
The Curie temperature, the spin-wave frequency, and the temperature dependence of the spontaneous magnetization are determined for ferromagnetic metal-metalloid glasses. The model of the structure of such glasses adopted in the present paper allows for the short-range order (formation of complexes with strong covalent bonds) and for the random nature of the distances between atoms of a 3d metal. Such a model can explain the apparent discrepancy between the observed relatively high Curie temperatures and the very large values of the coefficient B in the Bloch formula for the temperature dependence of the spontaneous magnetization $m(T)=m_0(1-BT^{3/2})$. The principal physical idea of the present theory is based on the fundamental difference between two characteristics of a random quantity: the average value (in the present case, it determines the exchange 'stiffness' of spin waves) and the percolation threshold (which determines the ordering temperature). (6 refs.)
114690 Effect of magnetic transformation on the nonmagnetic properties of Ce_2Ge_3 . A.A.Sevast'yanov, S.M.Barmin, S.V.Kortov, R.P.Krentsis, I.V.Gel'd (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.336-7 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.591-3 (Feb. 1983). [received: Sept. 1983]
The authors determine more accurately the phase transition temperature T_c in cerium germanate and study the behavior of its linear thermal expansion coefficient α and electrical resistivity ρ near T_c . (6 refs.)

114691 Diagram of corresponding states of easy-axis antiferromagnets. V.G.Bar'yakhtar, A.A.Galkin, A.N.Bogdanov, V.A.Galusko, V.T.Telepa (Donets Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1086-9 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1879-85 (Nov. 1982). [received: Sept. 1983]

Experimental investigations are made of the effect of high hydrostatic pressure (up to 15 kbar) on the spin-flop transition field (H_T), the Neel temperature (T_N), and the triple-point parameters (T_1, H_1) of the easy-axis antiferromagnets $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$ and $\text{CuCl}_2 \cdot 2\text{D}_2\text{O}$. The functional relations $H_T/H_1 = f(T/T_1)$ are the same for both the antiferromagnets studied and are independent of the value of the hydrostatic pressure; that is, a law of corresponding states holds. Analytical expressions are obtained for the dependence of H_T on pressure and temperature. The limits of applicability of the law of corresponding states are discussed. (19 refs.)

(inc. spin glasses)

114692 Ground state and the spectrum of spin excitations of a uniaxial ferromagnet with a planar defect. Yu.I.Gorobets, V.I.Finokhin (State Univ., Donetsk, Ukrainian SSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.226-33 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A distribution of the magnetization is found for a ferromagnet with a planar defect which alters the exchange integrals. It is shown that defects of this kind can give rise to specific magnetic inhomogeneities. A discrete part of the spectrum of spin excitations is found theoretically and, in particular, it is shown that new discrete levels may appear in the presence of defects. (16 refs.) *A.T.*

114693 Spin glass, ferromagnetic and mixed phases in the disordered Potts model. D.Elderfield, D.Sherrington (Dept. of Phys., Imperial Coll. London, London, England).

J. Phys. C (GB), vol.16, no.27, p.L971-7 (30 Sept. 1983). For a Potts spin glass model with Sherrington-Kirkpatrick exchange disorder the full phase structure in (J_0, J, h, T) is indicated. The phases predicted are analogous to those of a Heisenberg spin glass but there are important differences of transition orders and regions of stability. (11 refs.)

114694 Specific heat of compounds $\text{Ni}_x\text{Co}_{1-x}\text{Cl}_2$. M.O.Kostruykova, T.G.Sokolovskaya (Dept. of Low Temperature Phys., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.126-30 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.107-10 (1982).

The specific heat of three compounds $\text{Ni}_x\text{Co}_{1-x}\text{Cl}_2$ with $x=0.10, 0.18$, and 0.90 in the temperature range 2-27K is measured. Together with previous measurements on NiCl_2 and CoCl_2 , the results are compared with the theory of spin waves of laminar antiferromagnets. (13 refs.)

114695 Nearest-neighbor Ising model with an incommensurate phase and a Lifshitz point. B.Schaub, E.Domany (Dept. of Electronics, Weizmann Inst. of Sci., Rehovot, Israel).

Phys. Rev. B (USA), vol.28, no.5, p.2897-900 (1 Sept. 1983). An anisotropic triangular nearest-neighbor Ising model, with antiferromagnetic interactions, was studied. The phase diagram as a function of temperature and magnetic field was determined with the use of symmetry analysis, free-fermion approximation, phenomenological renormalization group, and Monte Carlo simulation. A massless phase, a Lifshitz point, and transition lines to commensurate phases were identified. (21 refs.)

75.40D Ising and other classical spin models

114696 The critical isotherm of the mixed spin Ising model. B.Y.Yousif, R.G.Bowers (Dept. of Appl. Math. & Theoretical Phys., Univ. of Liverpool, Liverpool, England).

J. Phys. A (GB), vol.16, no.14, p.3361-4 (1 Oct. 1983). Series expansions are used to estimate the critical exponent δ for several two- and three-dimensional mixed spin Ising models. The evidence supports the conjecture of extended spin independence. This suggests that mixed models and the standard 'single spin' models share the same value of δ . (9 refs.)

114697 Phase diagram of the ANNNI model in a field using a low-temperature series technique. J.Smith, J.Yeomans (Dept. of Phys., Univ. Southampton, Southampton, England).

J. Phys. C (GB), vol.16, no.27, p.5305-20 (30 Sept. 1983). The authors study the behaviour of the axial next-nearest-neighbour Ising (ANNNI) model in a field using low-temperature series. The analysis is a generalisation of the inductive scheme introduced by Fisher and Selke (1980, 1981) for the zero-field case. An infinite sequence of commensurate phases of mean wavevectors $q_j = \pi/(2j+1)a$, $j=2, 4, 6, \dots$, is shown to exist in the vicinity of a multiphase line. These phases form a subset of the sequence occurring for zero field. At large fields, the long-wavelength commensurate phases become unstable to the ferromagnetic state and an infinite sequence of triple points is seen. (13 refs.)

114698 Statics and dynamics of the infinite-range Ising spin glass model. N.D.Mackenzie (Dept. of Phys., Univ. of Edinburgh, Edinburgh, Scotland), A.P.Young.

J. Phys. C (GB), vol.16, no.27, p.5321-37 (30 Sept. 1983). The Sherrington-Kirkpatrick (SK) spin glass model (1975) is studied by Monte Carlo simulation. Below T_c there is a spectrum of relaxation times which diverge like $\exp(cN^{1/4})$ as N , the number of spins, tends to infinity. In zero field, \hat{h} , there is one more timescale, $\hat{\tau}_{eg}$, which is the time to turn over all the spins. Averaging over samples $(\ln \hat{\tau}_{eg})/(\ln \tau_{eg}) \propto N^{1/2}$. However, $\ln \hat{\tau}_{eg}$ is not a self-averaging quantity and there are large sample-to-sample variations even for $N \rightarrow \infty$. For $h \gg h^* = T/N^{1/2}$, where T is the temperature, fluctuations on timescale τ_{eg} may not occur. Above the Almeida-Thouless line (1978) relaxation times are finite and the SK solution is correct. Below this line, the results agree well with Parisi's theory (1983) if the latter is correctly interpreted. (40 refs.)

75.40F Heisenberg and other quantized spin models

114699 Classical treatment of a Heisenberg linear chain with spin alternation; application to the $\text{MnNi(EDTA).6H}_2\text{O}$ complex. M.Drillon, E.Coronado (Dept. Sci. des Matériaux, CNRS, Strasbourg, France), D.Beltran, R.Georges.

Chem. Phys. (Netherlands), vol.79, no.3, p.449-53 (15 Sept. 1983). The thermodynamic behaviour of an exchange-coupled linear system with two alternating spin sublattices is investigated from a classical point of view. A closed formula is derived for the magnetic susceptibility which is easily adapted to real spin systems, using appropriate scaling transformations. The proposed approach is shown to describe successfully the behaviour of a new bimetallic chain complex $\text{MnNi(EDTA).6H}_2\text{O}$. In particular, a minimum in the χT versus T plot is observed at very low temperature, in agreement with theory. (14 refs.)

114700 Self-consistent mean-field theory of the dynamics of a Heisenberg spin-glass. J.A.Hertz (Nordsk Inst. for Teoretisk Atomfysik, Copenhagen, Denmark), R.A.Klemm.

Phys. Rev. B (USA), vol.28, no.5, p.2877-9 (1 Sept. 1983). The dynamical properties of a Heisenberg spin-glass with mode coupling and a conserved spin are studied. The authors find critical slowing down and effectively relaxational dynamics in most of k space [$k \gg 1$, where $\xi \sim (T - T_g)^{-1/2}$]. At very long wavelengths ($k \xi \gg 1$) the effective transport coefficient is logarithmically divergent [$\sim (\ln \xi)^{1/2}$], and this correction induces similar logarithmic corrections to the power-law behavior at $k \xi \gg 1$. (10 refs.)

114701 Ground-state properties of the infinite-range vector spin-glasses. G.S.Grest, C.M.Soukoulis (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).

Phys. Rev. B (USA), vol.28, no.5, p.2886-9 (1 Sept. 1983). The ground-state properties of the infinite-range vector spin-glasses are studied by a 'slow-cooling' iterative solution of the mean-field equations. Results are presented for the zero-temperature probability distribution $P(H)$ of internal fields with and without an external magnetic field present. The authors also find the ground-state energy for the XY and Heisenberg models. $P(H)$ has a hole; i.e., $P(H)=0$ for $H < H_0$, which persists in high magnetic fields and relatively high temperatures, $T/T_c \lesssim 1/2$. The author studies for the infinite-range Heisenberg spin-glass appear to show macroscopic irreversibility, in contrast to the short-range Heisenberg case which has no irreversibility. Therefore the range of interaction plays an important role in determining the irreversible behavior. (15 refs.)

114702 Steepest descent approach to the domain-wall thermodynamics of a classical easy-plane ferromagnetic chain: application to CsNiF_3 . H.C.Fogedby, P.Hedegard, A.Svane (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).

Phys. Rev. B (USA), vol.28, no.5, p.2893-6 (1 Sept. 1983). The authors derive asymptotic low-temperature expressions for the free energy, the specific heat, and the magnetization of the classical easy-plane Heisenberg chain in a field. At low field the system forms a stable gas of spin waves and domain walls. In a temperature-broadened region about a characteristic field given by the anisotropy, the domain-wall gas becomes unstable and dissociates into spin waves. At higher fields the domain-wall gas is absent. Applying the authors results to CsNiF_3 they find qualitative agreement. (17 refs.)

75.60 DOMAIN EFFECTS, MAGNETIZATION CURVES, AND HYSTERESIS

75.60C Domain walls and domain structure (for magnetic bubbles, see 75.70K)

114704 Ferromagnetic domain wall pinning by a random array of inhomogeneities. P.Gaunt (Dept. of Phys., Univ. of Manitoba, Winnipeg, Canada). *Philos. Mag. B (GB)*, vol.48, no.3, p.261-76 (Sept. 1983).
The pinning site inhomogeneities interacting with a domain wall are characterized by the maximum restoring force, f , acting on an area A or domain wall. The critical field, H_0 , required to release this area from the pin is given by $f/2IA$ where I is the magnetic moment per unit volume. The area A is not independent of the applied field H and a statistical treatment is required to evaluate it. The Friedel 'steady state' model assumes that the volume swept out when a wall breaks away from a pin contains, on average, one replacement pin. This leads to the relation $A \propto 1/H^{1/2}$ and hence to the critical field $H_0 = 3\rho^2/(4\pi\gamma I)$ where ρ is the pin density and γ is the wall energy per unit area. If the parameter $\beta_0 = 3f/(8\pi\gamma b) > 1$, where $4b$ is the interaction range of the pin, then the Friedel model holds and the pinning is 'strong'. If $\beta < 1$ the Friedel model breaks down and the pinning is 'weak'. The unpinning process is then no longer connected with unit steps related to breakaway from single pins but with cooperative breakaway from many pinning sites. The effective pin density is expressed as $\rho' = \sqrt{\rho/v}$ where v is the volume swept out between minimum and maximum energy positions on the wall. The demagnetizing effects are considered in detail for both strong and weak pinning. (16 refs.)

75.60E Magnetization curves, hysteresis, Barkhausen and related effects

114705 Magnetic properties of HoPr alloys. O.S.Galkina, B.I.Urusova, V.F.Shalashov (M.V. Lomonosov State Univ., Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.398-401 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
The magnetic properties were determined for alloys belonging to the $\text{Ho}_{1-x}\text{Pr}_x$ system with praseodymium concentrations in the range 0.0-12.2 at.%. The field and temperature dependence of the magnetization were determined in the range 4.2-400K using magnetic fields up to 4×10^6 A/m. The magnetization depended on the praseodymium concentration and for $x=1.2$ at.% Pr the magnetization of the alloy was 4.5% higher than the magnetization of pure holmium subjected to a field of 4×10^6 A/m. Moreover, the magnetic moment had a maximum at 1.4 at.% Pr. (6 refs.) A.T.
114706 Magnetic properties of a nonlinear medium with ordered non-uniformities. S.T.Tolmachev. *Izv. VUZ Elektromekh. (USSR)*, no.6, p.31-7 (June 1983). In Russian.
Discusses a technique for identifying nonlinear isotropic properties of a two-dimensional heterogeneous medium, characterised by ordered non-uniformities. It is shown that the effective properties of such a medium, with arbitrary shape and concentration of the occlusions, can be determined by a solution of an integral equation for a constrained magnetisation region, corresponding to the main parallelogram of the periods. (10 refs.)
114707 Analytic separation of the factors contributing to the eddy current loss in magnetically nonlinear steel. A.L.Bowden, E.J.Davies (Dept. of Electrical & Electronic Engng., Univ. of Aston, Birmingham, England). *IEE Proc. B (GB)*, vol.130, no.5, p.364-72 (Sept. 1983).
Many approximate solutions for eddy-current loss in solid steel have been published, but little attention has been given to identifying the effects of magnetic nonlinearity on the loss and electromagnetic-field distribution. An analytic solution is described in which these effects are identified, and defined by simple factors which are determined from the B/H -curve for the steel; this curve is represented by the function $B=aH^b$. Saturation harmonics are accounted for approximately by the use of the single derived function $B_1=AH_1^b$; this is validated by a separate analytic investigation. Comparison with the limiting nonlinear theory, for which $B=\pm B_s$, leads to a definition of B_s which relates it to the shape of the B/H -curve. An experimental investigation to test the theory is also described. (17 refs.)
114708 Single crystal magnets. N.Ikuta (Miyagi Tech. Coll., Natori, Japan), M.Okada, M.Homma, T.Minowa. *J. Appl. Phys. (USA)*, vol.54, no.9, p.5400-3 (Sept. 1983).
Single crystals of the Fe-Cr-Co alloys without and with 3% Mo were prepared by a recrystallization process. The microstructures and the magnetic properties of (100), (110), and (111) single crystals were investigated after the heat treatment in the ridge region of the miscibility gap. The magnetic properties of the Fe-22 Cr-17 Co ridge single crystals were not affected very much by the crystal orientation. However, the Fe-23 Cr-20 Co-3 Mo alloys show the crystal orientation dependence of the magnetic properties. The single crystal alloys are aged in a magnetic field, the direction of which is varied around (100) axes. The magnetic properties are measured parallel to the applied field directions and are summarized in view of deviated angle from a (100) axis. The greater the deviation of the applied field direction from a (100) axis, the poorer are the magnetic properties of the Mo single crystal alloy. The best magnetic properties are achieved with Fe-22 Cr-18.5 Co-3 Mo (100) ridge single crystal as $B_r=1.58$ T (15.8 kG), $bH_c=72.8$ kA/m (910

Oe), and (BH) $\max=91.2$ kJ/m³ (11.4 MGOe), which is the highest energy product reported for the Fe-Cr-Co magnet family. (19 refs.)

114709 Inhomogeneous magnetic state in the system of solid solutions $(1-x)\text{Cu}_{0.5}\text{Al}_{0.5}\text{Cr}_2\text{S}_4-x\text{CuCr}_2\text{S}_4$. L.I.Koroleva, A.I.Kuz'minykh, I.V.Gordeev, Ya.A.Kesler (Dept. of General Phys. for Natural Faculties, Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.38-42 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.34-8 (1983).

The magnetic and electrical properties of the system of solid solutions $(1-x)\text{Cu}_{0.5}\text{Al}_{0.5}\text{Cr}_2\text{S}_4-x\text{CuCr}_2\text{S}_4$ ($0\leq x\leq 0.2$) are studied. All the compositions studied have semiconductor conductivity of p type. The dependence of the magnetization on the field strength is a superposition of the magnetization characteristic for an antiferromagnet and the small spontaneous magnetization. The spontaneous moment corresponding to one impurity ion Cu^{2+} is close to the magnetization of the ferromagnetic cluster formed by Cr^{3+} ions, the nearest neighbors of Cu^{2+} . It is suggested that these clusters (ferrons) are created by localization of holes around the acceptor copper ion because of the energy gain of s-d exchange. The presence of ferrons in these materials is also confirmed by the sharp rise in paramagnetic susceptibility in the region of the Curie point. Estimates of the magnitude of s-d exchange in these materials are given. (11 refs.)

75.60G High coercivity materials

114710 High remanence Fe-Co-W semihard magnetic alloys for relay or switch applications. K.Kumasaka, K.Ono (Electrical Communication Labs., NTT, Tokyo, Japan).

Rev. Electr. Commun. Lab. (Japan), vol.30, no.4, p.712-23 (July 1982). [received: Aug. 1983]

Magnetic properties of Fe-Co-W alloys have been investigated. Remanence, squareness ratio and coercive force are enhanced by aging after cold working and obtained remanence; $18\sim 19.2$ kG, squareness ratio >0.9 , coercive force; $20\sim 100$ Oe. These magnetic properties are suitable for relay or switch applications. Especially, Fe-12%Co-10%W alloy shows remanence; 19.2 kG, coercive force; 26 Oe, and has a good sealability with glass. Therefore, it is adequate for remanent reed switch application. A fine precipitate structure enhances coercive force. Developing a uniaxial magnetic anisotropy with easy magnetizing in the working direction enhances the squareness ratio. (15 refs.)

75.60L Magnetic aftereffects

114711 Theory of magnetic after-effects in ferromagnetic amorphous alloys. H.Kronmüller (Inst. für Phys. am Max-Planck-Inst. für Metallforschung, Stuttgart, Germany).

Philos. Mag. B (GB), vol.48, no.2, p.127-50 (Aug. 1983).

The magnetic after-effect spectrum of amorphous alloys is attributed to rearrangements of defect structures which are described by two-level systems. Using first-order reaction kinetics, the so-called stabilization potential of domain walls is determined for both 'reversible' and 'irreversible' after-effects. It is shown that by an appropriate averaging over the energy gap parameters and the activation energies, the relaxation phenomena in amorphous alloys can be described explicitly. (42 refs.)

114712 Influence of structural relaxation on the magnetic permeability aftereffect of amorphous ferromagnetic alloys. P.Allia, R.Sato Turtelli, F.Vinai (Istituto Elettrotecnico Nazionale 'Galileo Ferraris', Torino, Italy).

Solid State Commun. (USA), vol.47, no.12, p.951-4 (Sept. 1983).

Room temperature measurements of the aftereffect of the magnetic permeability have been performed on amorphous Fe-(Cu-Cr)-B ribbons annealed at various temperatures. The results, in good agreement with the predictions of a new theory, give information on the effect of structural relaxation on the shear stress defects responsible for the magnetic aftereffect. 75.70 MAGNETIC FILMS AND PLATES

114713 Slow fluctuations in the cyclical magnetic reversal of thin magnetic films. A.M.Buz'ko, V.V.Potemkin (Dept. of Oscillation of Phys., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.60-5 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.52-7 (1983).

A theoretical analysis is made of noise of type $1/f^\alpha$ arising in the cyclical magnetic reversal of ferromagnetic films. On the basis of the idea that, in the course of magnetic reversal without saturation of the sample, there is slow variation in the magnitude of the film volume undergoing magnetic reversal per cycle and also its 'switching' moments, an expression is found for the spectral density of the fluctuations of the magnetization, describing the rise in spectral density of the magnetic noise close to frequencies which are multiples of the pumping frequency. (7 refs.)

114714 Temperature dependence of the fluctuations of exchange interaction in amorphous Co-P alloys. R.S.Iskhakov, G.I.Fish, R.G.Khlebov (L.V. Kirenskiy Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.321-2 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.568-70 (Feb. 1983). [received: Sept. 1983]

The authors have performed systematic studies of the changes in the main characteristics of exchange fluctuations, such as the correlation radius and the mean-square deviation $\gamma_\alpha=\Delta\alpha/\alpha$ determined from a modification of the dispersion law for spin waves, in the course of crystallization of an amorphous alloy. The measurements were performed using the method of spin-wave resonance ($f=9.2$ GHz) on films of amorphous Co-P alloys having a thickness of 2000-3000 Å. (5 refs.)

75.70K Domain structure (magnetic bubbles)

114715 Structure of charged domain boundaries in Permalloy films. S.V.Kudryatsev, V.I.Malyutin (Moldavian State Univ., Saransk, Moldavian SSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.213-19 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

Minimization of the total energy is used to calculate the structure of Neel branches in an isolated charged 180° domain boundary directed at an arbitrary angle to the easy magnetization axis. The equilibrium width of these branches is also determined. (12 refs.) A.T.

114716 Investigation of a magnetostatic model in the theory of bubble domains. V.V.Dyakin, Yu.G.Lebede, V.Ya.Raevskii (Inst. of Metal Phys., Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.245-8 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

The equations of the magnetostatic model employed in studies of the motion of bubble domains are analysed. It is shown that the problem of the distribution of the magnetization tackled within the framework of this model does not have a unique solution, but this does not affect the description of bubble domain motion. A functional class is found for which the solution is unique and this is very important in practical calculations. (6 refs.) A.T.

114717 Magnetic domain structure observation by electron holography. A.Tonomura (Hitachi Ltd., Tokyo, Japan).

Oyo Buturi (Japan), vol.52, no.4, p.290-7 (April 1983). In Japanese.

Electron-beam holography using an electron-operated field-emission microscope has reached practical stage, and its new application has been developed for the observation of magnetic-field distributions. This observation method has proved to be capable of providing as a magnetic-field pattern the direct observation not only of the magnetization distribution in ferromagnetic thin-films but also of spatial magnetic-field distributions. The author describes the theory of this observation technique and presents experimental results of magnetic-domain observation in ferromagnetic thin-films, of spatial magnetic-field observation and of the Aharonov-Bohm effect. (25 refs.) K.B.

114718 Variation of properties of multilayer films of bismuth-containing ferrite-garnets under high-temperature annealing. G.V.Arzamastseva, F.V.Lisovskii, E.G.Mansvetova (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.343-4 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.602-4 (Feb. 1983). [received: Sept. 1983]

The authors ascertain the influence of high-temperature annealing on the layered structure of ferrite-garnet films. They investigated epitaxial films of ferrite-garnets of the composition $(\text{YGdYbBi})_3(\text{FeAl})_2\text{O}_{12}$ with a thickness of $5\text{-}20\ \mu$. The anneal was carried out isothermally (in several stages) in a muffle furnace in air at temperatures $T_a=800\text{-}1200^\circ\text{C}$. After each annealing operation (over several hours) they determined (at $R=290\text{K}$) the following film parameters: the period D of the labyrinth domain structure (from the diameter of the diffraction ring), the magnetization M_0 and the characteristic length l_w , the uniaxial, cubic, and rhombic anisotropy constants K_u , K_c , and K_r , as well as the angle ϑ_0 of the deviation of the axis of easy magnetization from the normal. (6 refs.)

75.80 MAGNETOMECHANICAL AND MAGNETOELECTRIC EFFECTS, MAGNETOSTRICTION

114719 Thermal expansion and compressibility of magnetic materials under hydrostatic pressure conditions. I.F.Mirsaev, G.G.Taluts (Inst. of Metal Phys., Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.239-44 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

The magnetic components of the thermal expansion coefficients and of the compressibility are calculated for uniaxial and cubic crystals subjected to hydrostatic pressures. The calculations are carried out using a nonlinear exchange-striction model. Nonlinear interactions are shown to make a considerable contribution to these components in the case of Invar FeNi alloys. An analysis is made of the relationship between the compressibilities determined by dynamic and static methods. (15 refs.) A.T.

114720 Magnetomechanical damping of nickel. S.A.Mahmoud, M.A.Semary (Phys. Dept., Cairo Univ., Cairo, Egypt). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.L9-11 (Sept. 1983). The magnetomechanical damping of nickel was measured in AC and DC magnetic fields. The position and magnitude of the peak value of the internal friction Q^{-1} were dependent on the amount of cold working, heat treatment and strain amplitude. A discussion of the results is given on the basis of dislocation-domain wall interactions. (11 refs.)

114721 Energy dissipation due to macroeddy currents with mechanical vibrations. V.V.Khil'chevskii, V.D.Deigraf (Kiev Polytech. Inst., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1275-80 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.99-102 (Sept. 1982). Losses due to macroeddy currents occur when a magnetised specimen carries out mechanical vibrations. The authors demonstrate that the logarithmic vibration decrement due to macroeddy currents is amplitude-dependent in a large range of stresses. (9 refs.)

76.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

114723 The effect of lattice discreteness on the linewidth of the electron spin resonance of local moments in metals. A.M.Stewart (W.M. Keck Lab. of Engng. Materials, California Inst. of Technol., Pasadena, CA, USA). *Aust. J. Phys. (Australia)*, vol.36, no.4, p.501-5 (1983). Solutions of the Hasegawa-Bloch equations for the electron spin resonance of local moments in metals are obtained which take account of the discrete nature of the lattice. The most notable result derived is that the resonance linewidth is proportional to $T-\theta$ for any degree of bottlenecking, where θ is the paramagnetic Curie temperature calculated with lattice discreteness. An alternative derivation of the appropriate Hasegawa-Bloch equations is also given. (12 refs.)

114724 Time-domain analysis of EPR measurements of polyacetylene and soliton diffusion. J.Tang, C.P.Lin, M.K.Bowman, J.R.Norris (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA), J.Isoya, H.Shirakawa. *Phys. Rev. B (USA)*, vol.28, no.5, p.2845-7 (1 Sept. 1983). A novel analysis of EPR measurements on polyacetylene is demonstrated by the analysis of the conventional line shape in time domain. Quantitative results of the hyperfine-coupling constant, the on-chain diffusion rate, and the off-chain hopping rate were extracted by nonlinear curve fitting to the time-domain signals, and they are consistent with the soliton model of polyacetylene. (16 refs.)

114725 Theory of saturation of magnetic resonance in solids at low temperatures. L.L.Buishvili, N.P.Fokina (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.215-18 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.381-6 (Feb. 1983). [received: Sept. 1983] A study is made of the low-temperature dynamics of the spin system of a solid paramagnet saturated by an alternating magnetic field. The Zeeman and dipole-dipole subsystems are redefined to allow for the effect of a demagnetizing field. Equations for the reciprocal temperatures of the subsystems are derived. Approximate solutions are obtained for certain special cases. (10 refs.)

114726 Spin-phonon interaction in the Ni²⁺:Al₂O₃ system at low temperatures. E.M.Ganapol'skii, D.N.Makovetskii (Inst. of Radio Phys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.607-10 346-8 (Feb. 1983). [received: Sept. 1983] The authors have used linear and nonlinear APR methods to investigate the spin-phonon interaction: in particular, to measure the spin-lattice relaxation time τ_1 in the system Ni²⁺:Al₂O₃ at a transition E₂-E₁ which is strictly forbidden for the electromagnetic field. This system is extremely interesting

from the standpoint of realizing phaser amplification and generation of hypersound, since here the conditions are such that the hypersonic wave to be amplified interacts efficiently with the paramagnetic centers. (12 refs.)

114727 Dipole broadening of the EPR line in case of non-Kramers ions. R.Kh.Sabirov. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.8, p.1263-5 (Aug. 1983). In Russian. Non-Kramers ions have a large g-factor anisotropy. The splitting factor for the non-Kramers doublets along the axis and perpendicular to the crystal symmetry axis O_z, is equal to zero ($g_{\perp}=0$). The EPR spectrum of such ions is described by the Hamiltonian $H_0=g_{\parallel}\beta H_z S_z^2+\Delta S_z^2$, where g_{\parallel} -splitting factor along O_z axis, H_z-z component of the magnetic field, Δ -splitting at zero magnetic field. It is proposed that at large ion concentrations the EPR line shape is determined by the dipole-dipole interaction described by $H_d=\sum_{ij}A_{ij}S_i^zS_j^z$. (7 refs.) V.G.P.

76.30F Iron group (3d) ions and impurities (Ti-Cu)

114728 EPR of Cu²⁺ in MgSeO₄·6H₂O single crystals. V.K.Jain (Dept. of Phys., M.D. Univ., Rohtak, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.7, p.430-1 (July 1983). The EPR spectrum of Cu²⁺ ($S=1/2$, $I=3/2$) in MgSeO₄·6H₂O consists of two overlapping angle-dependent four-line hyperfine patterns arising from two differently but magnetically equivalent Cu²⁺ complexes located at a specific site. The angular variation of the spectrum indicates that Cu²⁺ substitutes for Mg²⁺ at Y-ion sites only. (8 refs.)

114729 The unusual EPR spectra in single crystals of CuSiF₆·6H₂O and CuSiF₆·6D₂O. D.De Kumar (Dept. of Phys., Univ. of Texas, Arlington, TX, USA). *Indian J. Cryog.*, vol.8, no.1, p.17-23 (1983). EPR studies have been performed on single crystals of CuSiF₆·6D₂O in the range 35-16 GHz, and compared with EPR data of CuSiF₆·6H₂O in the range 4.2-400K. The inversion of the line shape of the highest resonant field has been observed for the first time in CuSiF₆·6H₂O in the neighborhood of its phase transition point around 294K as well as with orientation of the magnetic field at fixed temperature 298K. This is related to the cross relaxation between B-type complexes to the A-type complexes in CuSiF₆·6H₂O. Studies show that the structure of CuSiF₆·6D₂O should be identical to that of CuSiF₆·6H₂O. There may be a possibility of building a MASER with a single crystal of CuSiF₆·6H₂O. (17 refs.)

114730 Analysis of the spin-Hamiltonian parameters for Cr³⁺ in mirror and inversion symmetry sites of alexandrite (Al₂₋₃Cr₃BeO₄). Determination of the relative site occupancy by EPR. C.E.Forbes (Corporate Res. Center, Allied Corp., Morristown, NJ, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2590-9 (15 Sept. 1983). The EPR spectra of Cr³⁺ in single crystals of alexandrite (Al₂₋₃Cr₃BeO₄, x<0.01) have been obtained at temperatures between RT and 4.2K in the frequency range 9.5-9.1 GHz. The orthorhombic structure of Al₂BeO₄ has two distinct Al³⁺ sites in the unit cell corresponding to C_s and C_i symmetry. The EPR spectra at 35 GHz of Cr³⁺ in the C_s site have been previously analyzed by other investigators. This study reports the observation of Cr³⁺ in the C_i site and the refined spin-Hamiltonian parameters for both magnetic centers. The absolute sign of the fine structure tensor elements for the C_i site has been determined to be positive. The observed orientations of both the chromium mirror and inversion magnetic axes are consistent with the crystallographic symmetry relationships of pure Al₂BeO₄. A comparison of the measured Cr³⁺ EPR intensities for resonances from both sites indicates that for two magnetically dilute crystals, the mirror site is preferentially occupied with a relative site occupancy of 78%±3%. (33 refs.)

114731 Optical absorption and electron spin resonance in blue and green natural beryl: a comment [on paper by A. Blak et al., with their reply]. G.Lehmann (Inst. fur Phys. Chem., Westfälische Wilhelms-Univ., Munster, Germany), A.R.Blak, S.Isotani, S.Watanabe. *Phys. & Chem. Miner. (Germany)*, vol.9, no.6, p.278-80 (1983). For original paper see A.R. Blak et al., *ibid.*, vol.8, p.161 (1982). The angular variations of the central EPR signal in green beryl may result from superposition of unresolved components from crystallographically equivalent, but magnetically inequivalent, sites. Lehmann's analysis of the EPR spectra leads to the conclusion that the postulated position of the supposed Fe³⁺ in the structural channels is inconclusive. Rather, the signal may be due to a radiation defect not the Fe³⁺ species. Blak et al. reassert that the EPR spectrum can be attributed to Fe³⁺ located in the structural channels and that substitutional Fe³⁺ for Al, Be, and Si does not reduce to Fe²⁺ on heating. (7 refs.)

114732 The influence of spin-coupling on the ESR-spectra of the orthochromites YCrO₃ and LuCrO₃. K.Drager (Inst. fur Phys. Chem., Univ. Hamburg, Hamburg, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.848-54 (Aug. 1983). In German. Polycrystalline samples of stoichiometric YCrO₃ and LuCrO₃ were investigated by ESR in the temperature range between 140 K and 520 K. Although the orthochromites have a complicated spin structure, the line width shows the temperature dependence of simple antiferromagnetic systems. Up to a high degree the spectra have a Lorentzian line shape. The ESR intensity confirms the predictions of a cluster model. The coupling energy describing the gap between the bounded and the resonance state was found to be $\Delta E=250$ cm⁻¹ for YCrO₃ and $\Delta E=210$ cm⁻¹ for LuCrO₃. There is a distinct relation between the excitation energy ΔE and the volume V of the elementary cell. Further calculations concerning the isotropic exchange interaction result in a coupling constant of $J=5.55$ cm⁻¹ for YCrO₃ and $J=4.67$ cm⁻¹ for LuCrO₃. (22 refs.)

114733 The influence of fusion temperature on the defect center concentration of GeO_2 glass. G.Kordas, R.A.Weeks, D.L.Kinser (Vanderbilt Univ., Nashville, TN, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5394-9 (Sept. 1983).

Paramagnetic resonance spectra of virgin glasses and γ -ray irradiated GeO_2 glasses were studied with the electron spin resonance (ESR) method as a function of fusion temperatures. Fusions were made in air at temperatures between 1200 and 1650°C and cooled at constant rate. In virgin glasses, only the E' center was detected at concentrations of about $10^{15}/\text{g}$. After a γ -ray irradiation, a new resonance at the low-field side (LFS) of the E' center and a symmetric line with $g=1.91$ were observed. Measurements at various temperatures, power levels, and frequencies provide a basis for resolving the overlapping resonances. The authors labeled the paramagnetic center which produces the LFS signal, the H_0 center. The g values of the H_0 center are the basis for attributing this center to a hole located on a nonbridging oxygen. The $g=1.91$ resonance is attributed to Cr^{3+} or Mn^{2+} impurities in the GeO_2 glasses. At constant γ -ray dose, the H_0 center concentration decreased and the E' -center concentrations increased with increase of fusion temperature. (22 refs.)

114734 ESR of defects in III-V compounds. J.Schneider (Fraunhofer-Inst. fur Angewandte Festkorperphys., Freiburg, Germany).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland Pressing), p.225-35

A survey is given on deep defects in GaP, GaAs and InP identified by electron spin resonance (ESR). Defect structures to be discussed are (i) 3d transition metals, (ii) antisite defects and (iii) radiation induced centers. The relevance of such defects for the III-V materials technology will be illustrated by representative examples. (25 refs.)

76.30R Free radicals

114735 ESR study on radical existing in plasma-polymerized styrene thin film. K.Ohno, N.Ishii, J.Sohma (Faculty of Engng., Hokkaido Univ., Sapporo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.996-1000 (June 1983).

The residual radicals formed in plasma-polymerized styrene (PPS) thin films are investigated by ESR measurement. An asymmetric singlet line characteristic of oxide radicals with an-isotropic g -values ($g_1=2.008$, $g_2=2.006$, and $g_3=1.993$) is observed in PPS produced under oxygen carrier gas, whereas a symmetric line is observed in PPS produced under nitrogen carrier gas, as previously reported. Castner's and Korb and Marauni's methods are used to extract the unresolved inhomogeneous and homogeneous broadenings ΔH_G and ΔH_L , from which the spin-relaxation times T_1 and T_2 are obtained. In the case of the PPS with nitrogen carriers, the introduction of air accelerates the decrease in the concentration of radical ions and ΔH_G , while it keeps ΔH_L constant. The opposite variations in T_1 and T_2 mean that no annealing effect appear explicitly up to 100°C. At temperatures higher than 100°C, the increase in T_2 due to the decrease in the concentration of radicals makes the experimentally-recorded linewidth ΔH_{msl} narrower. (8 refs.)

114736 Rotational correlation times of a nitroxide spin probe in low temperature matrices determined by saturation transfer ESR: their correlation to dynamic behavior of radiation products. Y.Ito (Res. Reactor Inst., Kyoto Univ., Osaka, Japan).

J. Chem. Phys. (USA), vol.79, no.6, p.2650-9 (15 Sept. 1983).

Rotational correlation times τ_c of the spin probe, di-tert-butyl nitroxide, in several organic solvents cooled to temperatures lower than their melting points have been measured using a saturation transfer (ST) ESR technique. Since the ST spectra changed markedly depending on microwave power, the authors introduced a scaled ST parameter to eliminate this effect. The temperature dependence of τ_c in a noncrystalline phase can be described by the Arrhenius relation. The activation energies are 17.6 kJ mol⁻¹ for methanol containing 5% water, 20.8 kJ mol⁻¹ for ethanol, and 18.9 kJ mol⁻¹ for n-propanol. The values are close to the activation energies reported for the solvation and decay rates of electrons in the solvents. The rotational correlation time can be expressed in terms of a viscosity using the Stokes-Einstein equation. However, a macroscopic viscosity fails to reproduce the observed τ_c , especially at low temperatures. On the other hand, the authors have evaluated the solvation rate of an electron in n-propanol and the diffusion coefficients of radicals in methanol and 3-methylpentane on the basis of the tentative viscosity derived from τ_c using the same expression. The results are in good agreement with the experimental data. The temperature and phase dependences of τ_c will also be discussed. (27 refs.)

114737 Electron spin resonance study of spin exchange in a nematic solvent. N.M.Atherton, M.C.B.Shohoji (Dept. of Chem., Sheffield Univ., Sheffield, England).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.8, p.1243-7 (Aug. 1983).

Spin-exchange rate constants have been measured from the concentration dependence of the ESR linewidths of two nitroxide radicals, TANONE (4-oxo-2,2,6,6-tetramethylpiperidino-oxy) and M-DOXYL (2-hexyl-2-(10-methoxycarbonyldecyl)-4,4-dimethylazolidinyl-3-oxy), in the isotropic and nematic phases of MBBA. Strong exchange is observed for TANONE in both phases and for M-DOXYL in the isotropic phase but the latter radical exhibits weak exchange in the nematic phase. A qualitative discussion of the nature of the radical-radical encounters affords an explanation of the observations. (3 refs.)

76.40 DIAMAGNETIC AND CYCLOTRON RESONANCES

114738 Cyclotron resonance of inversion electrons on InSb in tilted magnetic fields. J.H.Crasemann, U.Merkt (Inst. fur Angewandte Phys., Univ. Hamburg, Hamburg, Germany).

Solid State Commun. (USA), vol.47, no.11, p.917-20 (Sept. 1983).

Cyclotron resonance (CR) of inversion electrons on InSb is studied in magnetic fields tilted away from the surface normal. Particularly, a pronounced splitting of the CR signals into two distinct resonances is observed. When the magnetic field is parallel to the inversion layer one of the two resonances vanishes and the other evolves into a bulk like CR at sufficiently low electron densities and in sufficiently high resonance magnetic fields. The different absorption modes are explained by a strong coupling of the electric and magnetic quantization on InSb in tilted magnetic fields. (16 refs.)

114739 Inverted population of light-hole band pumped at cyclotron resonance. V.A.Kozlov, L.S.Mazov, I.M.Nefedov (Inst. of Appl. Phys., Acad. of Sci., USSR).

Sov. Phys.-JETP (USA), vol.83, no.5, p.1037-42 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1794-803 (Nov. 1982). [received: Sept. 1983]

The authors investigate the behavior of a system of hot carriers inelastically scattered by optical phonons in a semiconductor in a strong microwave field and a magnetic field. A mechanism is proposed for the redistribution of the holes among the heavy and light subbands of the valence band; this mechanism is capable of controlling the relative hole densities. At cyclotron resonance of the heavy holes it is possible to produce inverted population of the light-hole subband with a relative density higher than in constant fields $E \perp B$. Cyclotron resonance of the light holes causes strong depletion of the light-carrier subband. (42 refs.)

Calculation of the cyclotron resonance linewidth in GaAs-AlGaAs heterostructures See Entry 114602

76.50 FERROMAGNETIC, ANTIFERROMAGNETIC, AND FERRIMAGNETIC RESONANCES; SPIN WAVE RESONANCE

(see also 75.30D Spin waves)

114740 Dynamic dislocation-induced broadening of a homogeneous ferromagnetic resonance line. E.I.Druinskii, A.I.Spol'nik (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.283-5 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.501-5 (Feb. 1983). [received: Sept. 1983]

The effect of mobile dislocations of the width of a homogeneous ferromagnetic resonance line is investigated. The line width is analyzed as a function of the velocity of the dislocations, of the relative density of mobile dislocations, and of the orientation of the glide plane in the crystal. The results are compared with those for sessile dislocations. (9 refs.)

76.60 NUCLEAR MAGNETIC RESONANCE AND RELAXATION

114741 NMR studies of pyridine on silica-alumina. G.E.Maciel, J.F.Haw, I-Suer Chuang, B.L.Hawkins, T.A.Early, D.R.McKay, L.Petrakis (Colorado State Univ., Fort Collins, CO, USA).

J. Am. Chem. Soc. (USA), vol.105, no.17, p.5529-35 (24 Aug. 1983).

¹³C and ¹⁵N NMR spectroscopy with cross-polarization and magic-angle spinning have been used to study the structure and dynamics of pyridine adsorbed on silica-alumina. Hydrogen bonding is the dominant interaction at high loadings levels (0.5 to 1 monolayer). At lower coverages, a Lewis acid-base complex dominates and the pyridine is significantly less mobile. Brønsted complexes are found if the surface has been pretreated with HCl gas; ¹⁵N NMR provides evidence for two distinct protonated forms of adsorbed pyridine. Experiments with variable contact time or with the decoupler off provide evidence for rotational diffusion about the C₂ axis of adsorbed pyridine. (32 refs.)

114742 Orientation and molecular structure of 1,5 and 1,8 dichloroanthraquinones by PMR in a nematic solution. B.B.Sharma, A.Saupe (Dept. of Phys., Kent State Univ., Kent, OH, USA), C.L.Khetrapal, A.C.Kunwar.

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.359-66 (1983).

The structures and the order parameters of 1,5 and 1,8 dichloroanthraquinones have been determined from the dipolar couplings between the protons in the nematic solutions. The results show the effect of steric interactions on the molecular structure. The aromatic rings of 1,8 dichloroanthraquinone are in different planes making an angle of 15° while 1,5 dichloroanthraquinone appears to be flat. The two molecules show peculiar differences in orientation. The 'in-plane' order parameters of the 1,8 derivative are about equal while the 1,5 derivative has a strongly preferred alignment axis close to the Cl-Cl internuclear axis. (9 refs.)

114743 ¹³C high resolution solid state NMR studies on cellulose samples of different physical structure. J.Kunze (Inst. fur Polymerchem. Erich Correns, Akad. der Wissenschaften, Teltow-Seehof, Germany), G.Scheler, B.Schroter, B.Philipp.

Polym. Bull. (Germany), vol.10, no.1-2, p.56-62 (June 1983).

¹³C high resolution solid state NMR spectra of cellulose samples differing in lattice type, crystallinity and gross morphology (pulp, filament, film, bead) are presented and discussed with regard to the above mentioned parameters of physical structure. (13 refs.)

114744 Absence of hydrogen in superconducting molybdenum sulfide, MoS₄. R.Baillif (Dept. de Phys. de la Matière Condensée, Univ. de Genève, Genève, Switzerland), K.Yvon, P.Fischer.

Solid State Commun. (USA), vol.47, no.11, p.895-8 (Sept. 1983).

Superconducting MoS₄ (T_c=1.8K) was prepared from the ternary sulfides MMo₂S₄ (M=Cu,Ni) by the acid extraction method, and was studied by neutron diffraction and NMR spectroscopy. In contrast to earlier reports no significant amounts of hydrogen could be found in the rhombohedral structure. However, large proton concentrations were found in samples which had been exposed to moist air. (15 refs.)

76.60C Chemical and Knight shifts

- 114745 NMR studies of Ge atoms in quenched f.c.c.-Ge alloys.** H.Murakami, I.Kanazawa, T.Shimizu (Dept. of Phys., Tokyo Gakuji Univ., Tokyo, Japan), K.Matsushita. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.489-92. The values of Knight shift of Ge in Cu-Ge and in Al-Ge dilute alloys were estimated to be about 480 ± 160 ppm. The effect of quenching on the Knight shift was studied on the Cu-Ge alloys. The ratio of Knight shift in quenched alloy to that in annealed one was about 1.4. The brief discussion on this ratio was reported. (5 refs.)

76.60E Relaxation effects

- 114746 Spin-lattice relaxation times of ^1H in aqueous gadolinium chloride solutions.** D.Kohnlein, O.Lutz, R.Ulmer (Phys. Inst., Univ. Tübingen, Tübingen, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.947-8 (Aug. 1983). Spin-lattice relaxation times T_1 of protons in aqueous solutions of gadolinium chloride have been measured at 2.11 T for a larger range of concentrations down to 0.035 millimolar. Very small amounts of GdCl_3 decrease strongly T_1 of the water protons. (17 refs.)
- 114747 ^1H NMR study of hydrogen motion in the β phase of the Mg_2NiH_x system.** S.Hayashi, K.Hayamizu, O.Yamamoto (Nat. Chem. Lab. for Industry, Ibaraki, Japan). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2308-14 (1 Sept. 1983). The motion of hydrogen atoms in the β -phase of Mg_2NiH_x was studied by the ^1H pulsed NMR spectroscopy. Fourier-transformed spectra and spin-lattice relaxation times in the laboratory frame (T_1) and in the rotating frame ($T_{1\rho}$) for $\text{Mg}_2\text{NiH}_{0.85}$ were measured in the temperature range between 170 and 460K. The ^1H magnetization in the hydride relaxes by the dipolar modulation caused by the hydrogen motion and paramagnetic impurities. It was confirmed that all hydrogen atoms in the hydride are equivalent with respect to their motion. The correlation frequencies were determined by the temperature dependences of the linewidth and the two relaxation times T_1 and $T_{1\rho}$, and they are in good agreement among them, giving a single activation energy 12 kcal/mol in the temperature range between 210 and 460K. The ^1H - ^1H dipole-dipole interaction exists in the motional narrowing region, which supports that the hydrogen motion is not a diffusion but a kind of rotation. (32 refs.)
- 114748 Carbon-13 line shape study of two-site exchange in solid dimethyl sulfone.** M.S.Solum, K.W.Zilm, J.Michl, D.M.Grant (Dept. of Chem., Univ. of Utah, Salt Lake City, UT, USA). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2940-4 (21 July 1983). The two-site exchange in dimethyl sulfone of methyl carbons having axially symmetric chemical shift tensors is studied by ^{13}C solid-state NMR. The rate constants for this motion as a function of temperature are determined by a comparison of experimental spectra from 297 to 337K with theoretically calculated ones. Fitting this kinetic data to the Eyring equation gave an enthalpy of activation of 13.3 ± 0.5 kcal/mol and entropy of activation of -1.4 ± 1.7 cal/(molK). The geometrical relationship between the principal axes of the shift tensors of the two methyl groups was also determined. (20 refs.)
- 114749 A general NMR spectral density and its experimental verification.** A.M.Albano, P.A.Beckmann, M.E.Carrington, F.A.Fusco, A.E.O'Neill, M.E.Scott (Dept. of Phys., Bryn Mawr College, Bryn Mawr, PA, USA). *J. Phys. C (GB)*, vol.16, no.27, p.L979-83 (30 Sept. 1983). The authors develop a new general spectral density for use in interpreting nuclear spin-lattice relaxation measurements in molecular solids where molecular and/or intramolecular reorientation is responsible for the relaxation. They show that the simplest case of the general theory fits both the temperature and Lamor frequency dependence of some very complicated relaxation measurements which could not be previously fitted using several standard spectral densities. The relationship of the spectral density to a distribution of molecular potentials is briefly outlined. (6 refs.)
- 114750 A ^{13}C NMR study of mesomorphic solutions of poly(*p*-phenylene terephthalamide).** L.G.Close Jr., R.E.Fornes, R.D.Gilbert (Fiber & Polymer Sci. Program, North Carolina State Univ., Raleigh, NC, USA). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.9, p.1825-37 (Sept. 1983). Solutions of poly(*p*-phenylene terephthalamide) in fuming sulfuric acid were characterized by ^{13}C NMR spectroscopy and solution viscosity measurements over the 2-28% w/w concentration range. The spectra showed the presence of two distinct amide carbonyl resonances at low concentration, tentatively assigned to cis and trans conformations. As the concentration increased, additional carbonyl lines were observed along with significant broadening. Peak area measurements showed that only the polymer molecules in the isotropic environments contributed to the ^{13}C NMR spectra and a considerable amount of the polymer remained in the isotropic phase at concentrations previously considered to consist of polymer in highly anisotropic regions. Spin-lattice relaxation times were measured at six concentrations using the inversion recovery method. The aromatic carbons relaxed at a much faster rate (ca. 0.10 s) than the carbonyls (ca. 0.45 s), but the relaxation rates for both carbons were essentially constant over the concentration range, indicating that

the observed isotropic phase is not affected by changes in the macroscopic solution behavior so as to alter spin-lattice relaxation mechanisms. (9 refs.)

- 114751 Nuclear magnetic resonance investigations of lithium diffusion in Li_2O , Li_2SiO_3 and LiAlO_2 .** T.Matsuo (Dept. of Phys., Toyo Univ., Saitama, Japan), H.Ohno, K.Noda, S.Konishi, H.Yoshida, H.Watanabe. *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, pt.8, p.1205-16 (Aug. 1983). Spin-lattice relaxation rates of ^7Li have been measured for Li_2O , Li_2SiO_3 and LiAlO_2 with pulsed nuclear magnetic resonance. Relaxation due to cation diffusion is observed with quadrupole and dipole interactions. Cation jump frequencies in the extrinsic region with apparent activation energies of ca. 0.4 eV for Li_2O , 0.81 eV for Li_2SiO_3 and 0.77 eV for LiAlO_2 are obtained. These activation energies are in good agreement with those of ionic conductivities in the extrinsic region. (7 refs.)
- 114752 NMR in quadrupole glasses and the spectral density of orientation fluctuations.** M.S.Conradi (Dept. of Phys., Coll. of William & Mary, Williamsburg, VA, USA). *Phys. Rev. B (USA)*, vol.28, no.5, p.2848-51 (1 Sept. 1983). Previous NMR experiments on H_2 at low temperatures ($T \leq 0.3\text{K}$) and intermediate orthohydrogen concentrations ($0.1 < x < 0.55$) indicate that H_2 forms a quadrupole glass state. The interpretation of the NMR data in terms of molecular orientations and/or reorientations has not been clear. The authors propose a unified explanation of the many NMR measurements (T_1 , line shape, spin echoes, and stimulated echoes) in terms of the spectral density of the molecular orientations. All the data are compatible with the development of a DC component in the spectral density as the temperature is decreased while the AC parts are not greatly changed. Strictly dynamic theories are shown not to agree with the experiments. The NMR behaviors of ordinary glasses and quadrupole glasses are compared and found to reflect fundamental symmetry differences between the two states. The spin-lattice relaxation data in H_2 appear to indicate a broad distribution of fluctuation frequencies. Interpretation of the observed minimum in T_1 as a motional minimum may be incorrect. Finally, an experimental test of the ergodicity of quadrupole glasses is proposed. (23 refs.)
- 114753 NMR study of both ^{19}F and ^{205}Tl motions in TlZrF_6 .** J.Alizon, J.P.Battut, J.Dupuis, H.Robert, I.Mansouri, D.Avignat (Univ. de Clermont-Ferrand II, Aubiere, France). *Solid State Commun. (USA)*, vol.47, no.12, p.969-72 (Sept. 1983). Spin-lattice relaxation times in the laboratory T_1 and rotating frames $T_{1\rho}$ for both ^{19}F and ^{205}Tl nuclei were measured as a function of temperature. Comparison of the temperature dependence of longitudinal NMR relaxation rates of both ^{19}F and ^{205}Tl suggests that Ti^+ ions are more mobile than F^- ones at high temperatures. Furthermore Fourier transform experiments show that two kinds of Ti^+ ion can be distinguished at high temperatures, one of them being more mobile than the other one and probably responsible for the ionic conductivity of this material. (13 refs.)
- 114754 Local boron environment in $\text{Ni}_{100-x}\text{B}_x$ metallic glasses: A NMR study.** P.Panissod, I.Bakonyi, R.Hasegawa. *Report KFKI-1983-57*, Hungarian Acad. Sci., Budapest (1983), 15 pp. From the analysis of the ^{11}B NMR spectra in a $a\text{-Ni}_{100-x}\text{B}_x$ ($18.5 \leq x \leq 40$) the electric field gradient (EFG) components on the B sites and their distributions are deduced, giving an insight into the local atomic arrangements. For $x=18.5$ and $x=40$, one finds relatively narrow distributions of the EFG components indicating weak fluctuations of the bonding angles, distances and nature of the atoms in the B coordination shell. The comparison with the compositionally closest nickel borides (Ni_3B and Ni_4B_3) immediately suggests that the local structure around B is similar in these glasses and in the related crystals, i.e. nickel trigonal prisms (6 Ni) whose rectangular faces are capped by 3 Ni (Ni_3B) or 3 Ni (Ni_4B_3). For intermediate concentrations the EFG components distributions are found significantly broader and comparable with those expected from random packing of spheres. However, the continuous evolution of the NMR spectra shape with increasing B content rather suggests an admixture of $c\text{-Ni}_3\text{B}$ like and $c\text{-Ni}_4\text{B}_3$ like B local environment, i.e. when B concentration increases more prisms share rectangular faces allowing boron-boron contact as in $c\text{-Ni}_4\text{B}_3$. No sign of a B coordination shell similar to that in $c\text{-Ni}_3\text{B}$ (8 Ni anticubes $+ 2\text{B}$) is found in the glasses. Measurements of transverse relaxation times T_2 , which reflect essentially the B-B bondings, qualitatively support these conclusions. (11 refs.)

76.70H Optical double magnetic resonance (ODMR)

- 114755 Optical detection of EPR of self-trapped excitons using photostimulated luminescence of crystals.** N.G.Romanov, V.A.Vetrov, P.G.Baranov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR). *JETP Lett. (USA)*, vol.37, no.7, p.386-8 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.325-8 (5 April 1983). [received: Oct. 1983] Optically detected EPR spectra are recorded for the first time using photostimulated luminescence of crystals. The mechanism of the formation of self-trapped excitons in fluorite crystals is clarified. (6 refs.)
- 114756 Determination of the g values of the ODMR signals in a-Si:H.** B.C.Cavenett, S.P.Depinna (Dept. of Phys., Univ. of Hull, Hull, England), I.G.Austin, T.M.Searle. *Philos. Mag. B (GB)*, vol.48, no.2, p.169-85 (Aug. 1983). Recent studies of optically detected magnetic resonance (ODMR) in a-Si:H have provided conflicting interpretations of the principal recombination processes in this material. In all cases the identification of the ODMR signals has rested on a comparison of the ODMR signal g values and those from the reported ESR and light-induced ESR (LESER) measurements in the literature.

The present controversy arises because of the diverse g values reported for the ODMR signals. The problem of measuring the g values associated with the ODMR signals in α -Si:H is discussed, and it is shown how most of the present discrepancies among the various reports can be resolved by experimental consideration. Finally, the implications of this study for the various recombination models deduced from the ODMR results are mentioned. (21 refs.)

114757 Quantum-beat free-induction decay in $\text{Tm}^{2+}:\text{SrF}_2$. Fourier-transform ESR spectroscopy by optical means. T.Kohmoto, Y.Fukuda, M.Tanigawa, T.Mishina, T.Hashi (Dept. of Phys., Kyoto Univ., Kyoto, Japan).

Phys. Rev. B (USA), vol.28, no.5, p.2869-72 (1-Sept. 1983).

The authors demonstrate, for the first time, a nanosecond Fourier-transform ESR experiment in solids achieved by optical means. ESR free-induction-decay signals in 0-100 Oe have been observed in the ground state of $\text{Tm}^{2+}:\text{SrF}_2$ as a new type of quantum beat generated by an optical excitation to the absorption band with a circularly polarized light pulse. The Fourier transform of the observed signals gives the ESR spectrum, and the origin of the decay is attributed to the superhyperfine interaction between the Tm^{2+} ion and neighboring fluorine nuclei. (15 refs.)

76.80 MÖSSBAUER EFFECT; OTHER GAMMA-RAY SPECTROSCOPY

114758 The influence of Cr and W contents of the isomer shift, hyperfine field distribution, and magnetic anisotropy of Fe-based amorphous alloys. S.T.Lin, L.Y.Jang, W.T.Ku, L.S.Chou (Dept. of Phys., Nat. Cheng Kung Univ., Tainan, Taiwan), Y.D.Yao.

Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan), vol.12, p.242- (Dec. 1982). [received: Sept. 1983]

The effect of transition metals on the magnetic properties of Fe-based amorphous alloys has been studied by magnetization measurements and Mossbauer spectroscopy. Magnetization results show that the addition of transition metals such as Mn, Cr, V and Ti to Fe-based alloys decreases the mean magnetic moment per metallic atom drastically. This is attributed to antiferromagnetic coupling between the magnetic moments of iron atoms and those of solute atoms. One of the advantages of Mossbauer effect measurement is the ability to investigate inhomogeneous magnetic character, a characteristic of amorphous magnetic alloys. The authors report their results on studying the influence of Cr and W contents on the isomer shift, hyperfine field distribution, and magnetic anisotropy of amorphous $\text{Fe}_{80-x}\text{Cr}_x\text{B}_{14}\text{Si}_6$ and $\text{Fe}_{80-x}\text{W}_x\text{B}_{14}\text{Si}_6$ alloys. (no refs.)

114759 Mossbauer investigation on $\text{SiO}_2\text{-Fe}_2\text{O}_3$ glasses obtained from gel. M.Guglielmi, A.Maddalena, G.Principi (Istituto di Chimica Industriale, Facoltà di Ingegneria, Padova, Italy).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.467-70 (Sept. 1983).

The authors studied the influence of Fe concentration on the $\text{Fe}^{2+}/\text{Fe}^{3+}$ ratio in the amorphous $\text{SiO}_2\text{-Fe}_2\text{O}_3$ system, by using the Mossbauer technique to give detailed information on the environment of iron, in whatever structure, and the sol-gel method which enabled the achievement of an alkali-free system in different ox-red conditions. (9 refs.)

114760 A Sn-119 and Fe-57 Mossbauer effect study of the crystalline phase of 7S5. D.G.Todoroff, R.Marande, D.Boyd, D.L.Uhrich (Dept. of Phys., Kent State Univ., Kent, OH, USA).

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.367-71 (1983).

The Mossbauer effect of Sn-119 and Fe-57 has been used to study solutions of trimethyltin-4-methoxybenzylidene-4'-aminocinnamate (4.3% by weight) and Fe-57 enriched 1-1'-diacetylferrocene (0.2% by weight) in the crystalline phase of the liquid crystalline material 4-n-pentylphenyl-4'-n-heptyloxythiobenzoate (7S5). A pronounced deviation from Debye-like behaviour was observed at 180K in the In (recoil-free fraction) vs. temperature data for the tin-bearing probe molecule. This deviation may be interpreted as due to a crystal-crystal phase transition which has been observed at 183K. For the iron-bearing probe molecule, no deviation from Debye behaviour was found up to 300K. The data of this report support the interpretation that the phase transition is due to a rotation of the 7S5 molecule about the C-S bond. (4 refs.)

114761 Free parameter of spinel structure and Mossbauer lineshift. V.I.Nikolaev, V.S.Rusakov, N.I.Chistyakova (Dept. of General Phys. for Phys. Faculty, Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.87-9 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.74-6 (1983).

The dependence of the Mossbauer lineshift δ in oxygen ferrite-spinels on the free parameter of the structure u is considered. The mutual disposition of the lines for the A and B points in the spectrum depends significantly on the oxygen parameter u . Within the framework of the field theory of ligands, theoretical dependences are obtained for the difference in the shifts $\Delta\delta^{\text{BA}} = \delta^{\text{B}} - \delta^{\text{A}}$ as a function of u , at various values of the lattice parameter a . This difference is expedient for comparison with experimental data, since it does not depend on the choice of radiation source and scarcely depends on a . The available experimental data for ferrite-spinels with Fe^{3+} ions at points A and B agree with the results of the calculations. In particular, the trend of the difference $\Delta\delta^{\text{BA}}$ to sign reversal with rise in u is confirmed. According to the results of the calculations, sign reversal should be observed at $u = u_{\text{cr}} = 0.3845$ for the case when $a = 8.30 \text{ \AA}$. (8 refs.)

114762 Determination of residual austenite by Mossbauer spectrometry. A.Ikhlef, T.Vieira, R.Vilar, G.Cizeron (Lab. de Structure des Matériaux Metalliques, Univ. Paris Sud, Orsay, France).

Mem. & Etud. Sci. Rev. Metall. (France), vol.80, no.7-8, p.377-84 (July-Aug. 1983). In French.

The results obtained by sigma measurement, X-ray diffraction and Mossbauer spectrometry on a spheroidal-graphite cast iron and a high-speed steel show that Mossbauer spectrometry gives a more realistic estimate of the residual austenite content compared with the other methods. (11 refs.)

114763 Mossbauer spectroscopic studies of surface magnetism. T.Shinjo (Inst. for Chem. Res., Kyoto Univ., Uji, Japan).

Oyo Buturi (Japan), vol.52, no.4, p.298-304 (April 1983). In Japanese.

Describes how Mossbauer spectroscopy can be used as a means of studying surface magnetism of ferromagnetic metal, and, especially, shows that a ^{56}Fe layer on which very thin ^{57}Fe is deposited as a probe can serve as a significantly effective specimen for surface magnetism studies. The topical areas include: (1) Mossbauer spectroscopy using inner transition electrons; (2) that using ^{57}Co radiation source nucleus; (3) that using ^{57}Fe absorber; and (4) experimental results for the surface magnetism of an oxide. (56 refs.) K.B.

114764 Comment on 'Mossbauer studies of the 6.2 keV γ -rays of ^{181}Ta in Ta-dichalcogenides'. T.Butz (Phys.-Dept., Tech. Univ. Munchen, Garching, Germany), A.Lerf.

Phys. Lett. A (Netherlands), vol.97A, no.5, p.217-18 (29 Aug. 1983).

For original paper see Eibschutz et al., *ibid.*, vol.93A, p.259 (1983). The reported discrepancy between TDPAC and Mossbauer measurements of the electric field gradient at Ta in 2H-TaS_2 is shown to be an artifact. Combining both results a new value for the 482 keV state quadrupole moment of ^{181}Ta is derived: $Q(5/2) = (+)2.36(5) \text{ b}$. (6 refs.)

114765 Mossbauer study of electrodeposited iron-nickel alloys. J.Jaen (Dept. of Phys. Chem. & Radiology, L. Eotvos Univ., Budapest, Hungary), A.Pashovsky, G.Raichevsky, I.Czako-Nagy, L.Kiss, A.Vertes.

Radiochem. & Radioanal. Lett. (Switzerland), vol.58, no.2, p.111-16 (19 Aug. 1983).

Mossbauer measurements on electrodeposited and cast iron-nickel alloys were carried out in absorption geometry. The average magnetic field of the electrodeposited alloys varies linearly with the nickel concentration in the studied concentration range (59.8-100% Ni) and is somewhat smaller than those of cast alloys of the same concentration. (7 refs.)

114766 Mossbauer spectroscopy on ^{133}Cs as a method to study vacancy migration in metals. E.Verbiest, H.Patyn (Inst. voor Kern-en Stralingsfysika, Univ. of Leuven, Leuven, Belgium).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.485-8

^{133}Cs Mossbauer spectra show which fractions of implanted ^{133}Xe atoms have trapped a certain number of vacancies. Changes of these fractions at certain annealing temperatures are due to migrating defects. This method to study damage recovery, and especially vacancy migration, is illustrated on Mo and Pt. (2 refs.)

114767 Correlated radiation damage induced by heavy ion recoil in cadmium and zinc. S.Hoth, W.Engel, R.Keitel, R.Seelboeck, W.Witthuhn (Phys. Inst., Univ. Erlangen-Nurnberg, Erlangen, Germany).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.815-17

The recoil-induced defect cascades produced after nuclear reactions have been investigated in the systems GeZn and SnCd with the PAD method. The temperature dependence of the fraction of probe nuclei located at unperturbed lattice sites can be explained in terms of trapping and detrapping of defects. The trapped defects are shown to be clusters whose constituents migrate with an activation energy of 0.18(3) eV in Zn and Cd. The impurity-defect complexes dissociate with activation energies of 0.65(4) and 0.75(3) eV in Zn and 0.70(3) eV in Cd. (3 refs.)

76.90 OTHER TOPICS IN MAGNETIC RESONANCES AND RELAXATION

(inc. muon probe studies)

114768 Muon spin relaxation analysis by trapping model with detrapping. T.Hatano, Y.Suzuki, T.Natsui, M.Doyama (Dept. of Metall. & Materials Sci., Univ. of Tokyo, Tokyo, Japan), Y.J.Uemura, T.Yamazaki, J.H.Brewer.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.274-7

A muon (μ^+) is an unstable particle which has a lifetime of 2.2 μsec . A positron, e^+ , a positive muon, μ^+ and a proton, p^+ are isotopes which have electric charge $+e$ and spin 1/2, and rest masses are $1m_e$, $207m_e$ and $1876m_e$, respectively. A positive muon is emitted from a decayed π^+ meson and the spin direction of the muon is anti-parallel to its momentum direction. Since muon spins are polarized and the muon has quite a large magnetic

moment, they are used as micron magnetic probes for magnetic materials. Furthermore, from the analogy of positron study, muons can be used as non-linear micros prove to lattice defects which trap muons. The muon spin relaxation function including trapping and strapping is discussed. (7 refs.)

77.00 DIELECTRIC PROPERTIES AND MATERIALS

(for conductivity phenomena, see 72.20 and 72.80)

77.20 PERMITTIVITY

114769 On the dielectric theory and computer simulation of water. O.Steinhauser (Inst. fur Theoretische Chem. & Strahlenchem., Univ. Wien, Wien, Austria).

Chem. Phys. (Netherlands), vol.79, no.3, p.465-82 (15 Sept. 1983).

The static dielectric properties of ST2 water are carefully examined by means of a computer-adapted Kirkwood theory. 'Experimental' data are provided by various molecular dynamics simulations involving 216, 500 and 1000 water molecules and corresponding to a variety of boundary conditions. It is shown that the integral of the respective modified T tensor plays the central role in matching different boundary conditions. Thus a unique dielectric constant $\epsilon=82\pm15$ is obtained for a density $\rho=1$ g/cm³ and a temperature $T=120^\circ\text{C}$. Furthermore, it is found that the constitutive relation $\mathbf{P}=[(\epsilon-1)/4\pi]\mathbf{E}$ is already fulfilled in a sample of a few hundred molecules. Finally, R-dependent Kirkwood g factors are discussed, which give a vivid picture, how different boundary conditions influence orientational correlations between water dipoles. (23 refs.)

114770 Effect of Mn doping on the dielectric properties of Ba₂Ti₉O₂₀ ceramics at microwave frequency. S.Nomura, K.Tomaya, K.Kaneta (Dept. of Phys. Electronics, Tokyo Inst. of Technol., Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1125-8 (July 1983).

The effect of Mn doping on the dielectric properties of Ba₂Ti₉O₂₀ ceramics has been investigated at microwave frequency. The dielectric constant and the temperature coefficient are not sensitive to the addition of Mn, while the unloaded Q depends strongly upon it as well as on heat treatment at high temperature. A minute addition of Mn leads to an increase in the Q value. A high value of Q of more than 5200 was obtained at 9 GHz with the addition of 0.5~1.0 mol.% Mn. (9 refs.)

114771 Anisotropy of electric properties in binary cholesteric mixtures. M.Honciuc, C.Motoc, O.Savin (Dept. of Phys., Polytech. Inst., Bucharest, Rumania).

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.339-50 (1983).

Dielectric permittivity and electric conductivity anisotropies were determined for cholesterol laurate, cholesterol caprilate as well as for their mixtures 25:75%, 50:50% and 75:25% (by weight). Connection between anisotropies of pure substances and their mixtures were found. The mixtures 75:25% and 25:75% have positive conductivities anisotropies within the cholesteric range as for the initial esters; the sign of the dielectric anisotropy is the same as for the prevailing ester. Within the smectic range the dielectric anisotropy is opposite for both mixtures and pure compounds, in accordance to Carr's (1969) hypothesis with reference to the conduction mechanism in smectics. The phase transitions are revealed in most cases by maxima or minima of the dielectric anisotropies. (15 refs.)

114772 Dielectric properties of Ag₃AsS₃ in the region of high ionic conductivity. V.B.Zlokazov, A.N.Babushkin, L.Ya.Kobelev (A.M. Gorki Ural State Univ., Sverdlovsk, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.324-5 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.573-4 (Feb. 1983). [received: Sept. 1983]

Because of the partial dissociation of proustite in a vacuum and in air at 430-470K, it is advisable to investigate its physical properties at high temperatures in a closed system to ensure that the material is in equilibrium with the vapor phase. In order to produce such conditions, the proustite was remelted in an evacuated pyrex ampule with three platinum wire electrodes soldered into the walls. The electrical properties of a polycrystalline proustite specimen were investigated at a frequency of 1592 Hz using an accurate VM484 semiautomatic bridge. Values of the capacitance, electric loss tangent and permittivity were calculated from the volume impedance values. (6 refs.)

114773 Admissible values of permittivity and magnetic permeability of matter. O.V.Dolgov, D.A.Kirzhnits, V.V.Losyakov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-JETP (USA), vol.83, no.5, p.1095-102 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1894-907 (Nov. 1982). [received: Sept. 1983]

Results are presented of a systematic investigation of an equilibrium homogeneous and isotropic medium from the viewpoint of its causal properties (the Kramers-Kronig and Leontovich relations) and of its stability to electro-magnetic perturbations. The ranges of permissible values of the permittivity and the magnetic permeability of matter are then found in the static limit and over the entire range of variation of the wave vector. It is shown that the magnetic permeability, unlike the permittivity, cannot be negative; that the lower limit of the magnetic permeability (which coincides with the magnetic permeability of a London superconductor) increases with increasing wave vector and approaches unity, that no order parameter H (magnetic field) can be produced via a phase transition from the state of a stable homogeneous and isotropic medium, and that in this sense no media with spontaneous homogeneous electric field can exist. 77.30 POLARIZATION AND DEPOLARIZATION EFFECTS

114774 On magneto-photo-electret of sulphur and time-variation of its dielectric constant. A.K.Chatterjee, S.D.Chatterjee (Dept. of Phys., Jadavpur Univ., Calcutta, India).

Indian J. Phys. Part A, vol.57A, no.3, p.208-10 (May 1983).

Nadzhakov (1937) discovered during a study of photo-conduction of polycrystalline sulphur that space charges accumulated in the dielectric, which were retained for a long time after the illumination ceased and the applied electric field removed. An analogous effect has been observed when a thin double-plated and perforated trimmer condenser impregnated with polycrystalline sulphur is illuminated with an incandescent lamp while placed in a magnetic field at room temperature. The induced polarization and subsequent depolarization of the specimen were verified by the measurements of its dielectric constant. (5 refs.)

114775 Polarization character in small ferroelectric particles and the monodomain state conditions. B.N.Rolov, Yu.E.Lorents.

Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.4, p.28-32 (1983). In Russian.

The thermodynamic theory for spontaneous polarization in small ferroelectric particles is carried out. The corresponding model and energy balance for a small ferroelectric particle is considered. An analysis for a monodomain state is carried out and the conditions for this state are obtained. (9 refs.)

114776 Studies of Kirkwood-Frohlich's correlation factor and dielectric relaxation in triethylamine-solutions. S.C.Srivastava (Dept. of Phys., Allahabad Univ., Allahabad, India), R.Sabesan, R.Varadarajan, M.Sargurumoorthy.

Proc. Natl. Acad. Sci. India Sect. A, vol.52, pt.2, p.219-24 (1982). [received: Aug. 1983]

The linear correlation factor of dielectric polarization 'g' is calculated from the Kirkwood-Frohlich relation by measuring the refractive indices for the D-line and the dielectric constants at 300 kHz for pure triethylamine and in dilution with non-interacting solvents. The dielectric relaxation times at the X-band microwave frequency are also measured. The data are obtained in terms of the distribution parameter and the relaxation time of the complexed species in relation to the state of aggregation of the amine. (14 refs.)

114777 Effect of the internal bias field on the dielectric characteristics of strontium titanate single crystals. A.I.Dedyk, N.N.Lebedeva, G.D.Loos (V.I. Ul'yanov Electrotech. Inst., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.316-17 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.559-61 (Feb. 1983). [received: Sept. 1983]

Investigates the nature of the residual polarization and also its effect on the dielectric characteristics of SrTiO₃:e (E), tan δ (E), where E is the external electric bias field. The investigations were carried out on single crystals grown by the Verneuil method, with an impurity concentration (% by weight): Fe=0.005; Cr, Co, Ni, Al, Ng, Ca, Ba—about 0.01; and Mn, Pb—less than 0.0001. All the dielectric measurements were made at a frequency of 1 kHz at 4.2K. (2 refs.)

77.40 DIELECTRIC LOSS AND RELAXATION

114778 Dipole-phonon coupling and dielectric relaxation. R.Nigmatullin, L.A.Dissado (Chelsea Coll., Univ. of London, London, England).

Chem. Phys. (Netherlands), vol.79, no.3, p.455-63 (15 Sept. 1983).

Equations of motion for the average polarisation are derived from a microscopic approach by use of the local density matrix. A specific form of the dipole-phonon coupling in the memory kernel is investigated and the necessary conditions for the generation of a non-Debye form of response examined. It is shown that these conditions can only be fulfilled by allowing for dipole-induced distortion with the lifetime of the 'photons' determined by the lifetime of the dipole correlation. (24 refs.)

114779 Dielectric relaxation and modulus of V₂O₅-TeO₂ glasses. A.Mansingh, V.K.Dhawan (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India), M.Sayer.

Philos. Mag. B (GB), vol.48, no.3, p.215-36 (Sept. 1983).

The dielectric behaviour of V₂O₅-TeO₂ glasses in the composition region 10 to 80 mol.% V₂O₅ is reported for the temperature region 77 to 500K and the frequency region 0.1 to 100 kHz. The variation of dielectric constant ε' with temperature and frequency in the region where the measured AC conductivity approaches the DC conductivity indicates a bulk dielectric relaxation with a distribution of dielectric relaxation times and in terms of conductivity relaxation using dielectric modulus M* = 1/ε* plots. The d.c. conductivity, dielectric relaxation and conductivity relaxation have the same activation energy of 0.21-0.42 eV for decreasing V₂O₅ content and a frequency factor ν₀ of 5×10¹⁰ Hz. The difference between this value and the 10¹² Hz expected for phonon frequencies is attributed to a tunnelling contribution. The dielectric modulus approach is satisfactory for electronic glasses with respect to the calculation of ε₀ and σ₀, but provides less reliable information on the dielectric relaxation time distribution than would a dielectric analysis. The glass former TeO₂ gives rise to unusually large values for ε₀=40-69 and ε_∞=18-31, and a narrower distribution of relaxation times than the analogous phosphate glasses. The total a.c. conductivity can be clearly separated into three com-

ponents; d.c. conductivity, a dipolar contribution and hopping conduction at low temperatures. (34 refs.)

114780 The dielectric properties of lead germanate single crystals having an initial domain structure. V.Ya.Shur, Yu.A.Popov, A.L.Subbotin (A.M. Gorki Ural State Univ., Sverdlovsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.318-19 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.564-5 (Feb. 1983). [received: Sept. 1983]

The authors have measured the capacitance and $\tan \delta$ of single-crystal plates of lead germanate having transition domain structures that had different fractions of free domain structures. The fraction of the free domain structure was defined as the ratio of the reversible charges in the transition domain structure and the free domain structure (P/P_{∞}). The specimens were plane-parallel plates 1.2 mm. The value of the reversible charge was found from measurements of the dielectric hysteresis loop at a frequency of 50 Hz. (4 refs.)

77.50 DIELECTRIC BREAKDOWN AND SPACE-CHARGE EFFECTS

114781 How electric strength of polyethylene and polystyrene is influenced by residual phenomena caused by ionising radiation and pressure. S.N.Kolesov, I.S.Kolesov.

Elektrichestvo (USSR), no.5, p.72-3 (May 1982). In Russian. Establishes correlation of relationships in variation of super-molecular structure, density and electric strength of industrial specimens subjected to doses of neutron and gamma radiation at various pressures. Heat-treatment reduces the number of micropores and cracks. Polymer residual deformation increases with increase of specific pressure. (7 refs.)

114782 High voltage electric field and space-charge distributions in highly purified water. M.Zahn, T.Takada (High Voltage Res. Lab., MIT, Cambridge, MA, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.4762-75 (Sept. 1983). High voltage Kerr electrooptic field mapping measurements in highly purified water show significant field distortions due to injected positive space charge over the temperature range of 8-25°C using parallel plane stainless steel electrodes stressed to average field strengths up to 150 kV/cm. The net space charge was always positive with density of $\approx 2 \text{ C/m}^3$ which is about 40% of the background value of charge density of thermally generated hydronium and hydroxyl ions. Because measurements only showed a net positive space charge, a unipolar drift dominated conduction model was developed where positive charge would migrate in an ohmic medium. This model predicts the observed propagating charge front, electric field enhancement at the non-charge injecting electrode, and field decrease at the charge injecting electrode. The time of flight of positive charge between electrodes gave an estimate of the positive ion mobility of $\mu \approx 4 \times 10^{-7} \text{ m}^2/(\text{V s})$ which is in between the values of the hydronium ion mobility measured at low voltages and the electrohydrodynamic mobility which accounts for field convection effects due to the Coulombic force putting the fluid into motion. The dielectric relaxation time at $T \approx 8^\circ\text{C}$ ($\tau \approx 320 \text{ } \mu\text{s}$) measured at low voltage was much less than the measured charge transport time between electrodes, $\tau_{\text{mig}} \approx 2 \text{ msec}$, so that the calculated effects of space charge were much less than measured because the charge relaxes quickly as it migrates. It was found that a dielectric relaxation time of $\tau \approx 1.6 \text{ msec}$ would provide a good fit between analysis and experiments. (14 refs.)

114783 Leakage and breakdown in thin oxide capacitors correlation with decorated stacking faults. P.S.D.Lin, R.B.Marcus, T.T.Sheng (Bell Labs., Murray Hill, NJ, USA).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1878-83 (Sept. 1983). Thin oxide MOS capacitors which exhibited high leakage and lowered breakdown strength were studied by a number of methods in order to identify the mechanism responsible for the degradation. Electron beam-induced current (EBIC) studies, Secco etching, transmission electron microscope imaging, and energy dispersive X-ray spectroscopy were all applied to this problem. The results indicated that the defects responsible for the poor dielectric properties are impurity (Cu, Ni, Fe, Zn, Sn)-decorated stacking faults about 1 μ in length, located in silicon near the silicon-silicon dioxide interface. This study establishes that decorated stacking faults degrade the quality of MOS capacitors by increasing capacitor leakage and decreasing breakdown strength. (11 refs.)

77.55 DIELECTRIC THIN FILMS

114784 The dielectric properties of some PbO-based amorphous films prepared by twin-roller method. H.Nasu, M.Yoshimoto, R.Ota, N.Soga (Dept. of Industrial Chem., Kyoto Univ., Kyoto-shi, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.6, p.303-5 (1983). In Japanese. The glass-forming regions have been determined by a twin-roller method for some PbO-based binary systems which contain no glass-forming oxide SiO_2 or B_2O_3 . The dielectric constant ϵ_s and the dielectric loss $\tan \delta$ were measured at

room temperature in the frequency range 20 Hz \sim 5 MHz for the amorphous films of 80 PbO-20 M_2O_y composition where $\text{M}_2\text{O}_y = \text{Li}_2\text{O}$, CaO, TiO_2 and V_2O_5 . The compositional variations of ϵ_s and $\tan \delta$ were interpreted to be due to be due to the cationic field strength z/r of the additive cations except for the PbO- TiO_2 system, where $\alpha\text{-PbTiO}_3$ -like units of extraordinary high ϵ_s may be formed in the glassy state. (for piezo-optical effects, see 78.20H)

114785 Solid solutions based on lead barium metaniobate. S.A.Gridnev, N.V.Barmina, N.G.Pavlova, N.N.Parfenova, E.P.Smironova (Voronezh Polytech. Inst., Voronezh, USSR). *Inorg. Mater. (USA)*, vol.18, no.10, p.1399-402 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1632-5 (Oct. 1982). [received: Sept. 1983]

Solid solutions with the compositions $(1-x-y-z)\text{PbNb}_2\text{O}_6 + x\text{BaNb}_2\text{O}_6 + y\text{Pb}_2\text{Ti}_2\text{O}_6 + z\text{Na}_2\text{Nb}_2\text{O}_6$ with high Curie temperatures (470-600°C) were obtained. Conditions of polarization were worked out, and materials with high values of the piezomodulus $d_{33} = (40-50) \times 10^{-12} \text{ C/N}$ and $d_{31} = 5.3 \times 10^{-12} \text{ C/N}$ were obtained. The investigated system is characterized by a high temperature stability (up to 300°C) of the piezoelectric properties and elastic pliability. The introduction of barium and sodium metaniobates and lead titanate into the ceramic lead metaniobate permits the production of piezomaterials both with high ($Q_m = 300-350$) and with low ($Q_m = 20$) mechanical quality factors. (7 refs.)

114786 Nonlinear electroacoustic equations for piezoelectric powders. J.Pouget, G.A.Maugin (Lab. de Mecanique Theorique, Univ. Pierre-et-Marie-Curie, Paris, France).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.925-40 (Sept. 1983). A nonlinear theory based on the notion of oriented continuum is presented with a view to describing piezoelectric powders. The generalized kinematics comprehends the macroscopic motion of grains as well as the internal deformation (rotation, stretch) of grains (via a so-called director field) in connection with local electromechanical interactions. A complete set of coupled dynamical electroacoustic equations is deduced from first principles for this class of granular media. Thermodynamical arguments then allow one to construct general constitutive equations that exhibit both thermodynamically reversible and irreversible processes. Of necessity, the theory is first constructed in a fully nonlinear framework. In a second stage, the nonlinear equations are perturbed, by means of a Lagrangian variation, about a free finite initial state in which the directors are randomly oriented. These initial privileged directions provoke a local breaking of the ideal symmetry of the material and there results a nonhomogeneous medium. In addition, in the perturbed equations thus obtained, nonlinear terms related to ponderomotive couples and orientational electromechanical couplings are involved. Among the equations obtained, one governs the internal deformation of grains, which materialize in a microgyration of grains about their center of mass and a microstretch in the direction along which the local electromechanical interactions take place. This work collects all the essential ingredients which are required in a study of physically interesting phenomena such as memory echoes in resonant piezoelectric powders. (40 refs.)

114787 Continuum approach to electroacoustic echoes in piezoelectric powders. J.Pouget, G.A.Maugin (Lab. de Mecanique Theorique, Univ. Pierre et Marie Curie, Paris, France).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.941-54 (Sept. 1983). Based on an oriented continuum model, a continuum approach for powders made of piezoelectric grains proposed in a previous work is applied to the study of electroacoustic echoes in resonant piezoelectric powders. The nonlinear equations obtained through this approach govern the piezoelectric oscillations and microgyration motion of each grain, as well as the global behavior of the powder and lead to the echo formation. The evaluations of the dynamical echo at 2τ and the memory echo at $T+\tau$ are presented. A memory phenomenon lying in the reorientation of grains due to a ponderomotive couple inside the powder sample is placed in evidence. The global response of the sample consists in summing up all the elementary electric polarizations associated with the piezoelectric oscillations of grains. Then the echoes are caused not only by the nonlinear interaction effects between the deformation of grains and the electric field, but also by a refocalization of collective oscillations which, after a complete dephasing period, gives a coherent signal through the inversion of the phase evolution. This continuum approach presents definite advantages over previous ones. Typical numerical values of parameters involved in this phenomenon as well as physical interpretations are given. (49 refs.)

114788 The effect of dye sorption on electromechanical properties in sodium poly(L-glutamate). Y.Ando, N.Kawabata, K.Nishida (Faculty of Technol., Tokyo Univ. of Agriculture & Technol., Tokyo, Japan).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.9, p.1661-5 (Sept. 1983). Piezoelectric constant, Young's elastic modulus, and dielectric constant of undyed and dyed films of poly(L-glutamate) were measured at 10 Hz over the temperature range -120 to 120°C . The temperature of the maximum in $-d'_{14}$ shifts toward higher temperature up to 0.6 mg/g polymer of dye uptake and then shifts toward lower temperature by further dye sorption. The variation of the piezoelectric modulus was interpreted by the change of mobility of impurity ions in the sample. (7 refs.)

114789 Polar glass ceramics—a new family of electroceramic materials: tailoring the piezoelectric and pyroelectric properties. A.Halliyal, A.S.Bhalla, R.E.Newnham (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).

Mater. Res. Bull. (USA), vol.18, no.8, p.1007-19 (Aug. 1983). Grain oriented multicomponent polar glass-ceramics have been prepared by crystallizing the glasses in a temperature gradient. Inexpensive, large area piezoelectric and pyroelectric devices can be fabricated by this method, and by adjusting the composition of the glasses and crystallization conditions, it is possible to tailor the properties to meet device requirements. Based on the growth characteristics and the connectivity pattern of the crystallites, the piezoelectric, pyroelectric and dielectric properties of glass-ceramic composites can be predicted. Two examples discussed in this paper are piezoelectric glass-ceramics which are not pyroelectric, and pyroelectric glass-ceramics which are not piezoelectric. (22 refs.)

114790 On a peculiarity of the piezoeffect in carbonate-cancrinite crystals. I.B.Kobyakov, A.A.Levin, Yu.I.Smolin (Inst. of General & Inorganic Chem., Acad. of Sci., USSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1112-15 (Nov. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.5, p.1924-9 (Nov. 1982). [received: Sept. 1983]
In the course of an X-ray study of the structure of carbonate-cancrinite in an electric field, an anomalously large deformation of the CO₃ ion, located in channels and tightly coupled to the aluminosilico-oxygen framework was observed. A model of the action of the channels on such a lattice characteristic of the piezoeffect has been developed for zeolites. The theoretical value of the piezomodulus $d_{33}=28.3\times10^{-12}$ C/N and the experimental value $d_{15}=-16.5\times10^{-12}$ C/N of carbon cancrinite were found to be higher than the piezomoduli of the strongest linear piezoelectric substances known at present. The authors have considered and systematized data published in the literature on organic and molecular crystals, liquid crystals, and polymers possessing ferroelectric properties as well as a number of organic materials (asymmetric) which possess pyroelectric properties. (50 refs.)

114792 Ferroelectric fluctuations in KDP and DKDP. R.A.Cowley, H.-J.Bleif, S.R.Andrews, R.J.Nelmes (Dept. of Phys., Univ. of Edinburgh, Edinburgh, Scotland). *Physica B & C (Netherlands)*, vol.120B+C, no.1-3, p.267-9 (May 1983). (Yamada Conference VI on Neutron Scattering in Condensed Matter, Hakone, Japan, 1-4 Sept. 1982).
X-ray scattering measurements have been made of the ferroelectric critical scattering from KDP and DKDP. The results show that the wavevector dependence of the scattering is very similar for KDP and DKDP and is consistent with earlier neutron scattering measurements for DKDP. The atomic displacements in the ferroelectric fluctuations have been determined and it is necessary to take account of the coupling between the ferroelectric fluctuations and a transverse acoustic normal mode. When this is done the atomic motions are found to be consistent with those deduced from recent high-resolution structural measurements in that the K barely moves and the P moves considerably more in DKDP than in KDP. 114793 Study of the ferroelectric phase transition in rubidium hydrogen selenate by high-resolution NMR of ⁷⁷Se. O.V.Rozanov, Yu.N.Moskvich, A.A.Sukhovskii (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.212-14 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.376-80 (Feb. 1983). [received: Sept. 1983]
High-resolution NMR spectra of the rare nuclei ⁷⁷Se were measured in the paraelectric and ferroelectric phases of the rubidium hydrogen selenate crystal. Analysis of the resulting parameters of the magnetic shielding tensors for the selenium nuclei, including the directions of the tensor principal axes, showed that the ferroelectric phase transition in this crystal is due to the ordering of hydrogen on only one of the two types of hydrogen bonds. (17 refs.)

114794 Curie-Weiss law for improper ferroelectric or ferroelastic phase transitions. D.G.Sannikov (Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.249-50 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.441-4 (Feb. 1983). [received: Sept. 1983]
It is shown that if two components of the polarization (deformation) vector and of the order parameter transform under different mutually interacting two-dimensional irreducible representations of the symmetry group of the initial crystal phase, then one of the components of the electric susceptibility (mechanical compliance) tensor obeys the Curie-Weiss law in the polar phase. Certain dynamic properties in the neighborhood of such a two-component improper ferroelectric (ferroelastic) phase transition are analyzed. (6 refs.)

114795 On the relation between the dielectric anomalies and the isofrequency dependences of inelastic scattering of light in lithium tantalate crystals. V.S.Gorelik, B.S.Umarov, M.Umarov (P.V. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.279-83 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.495-500 (Feb. 1983). [received: Sept. 1983]
This paper reports investigations of the isofrequency temperature dependences of inelastic scattering of light in lithium tantalate crystals. At low frequencies, Ω , sharp changes are observed to occur in the inelastic scattering intensity near the transition temperature. The experimental data obtained are compared with the results of the simplest variant of the theory of light scattering near a phase transition point in crystals. The temperature coefficient of the relaxation time is computed on the basis of the dependences obtained. It is concluded that it is possible to trace a ferroelectric phase transition on the basis of an analysis of isofrequency inelastic scattering. (10 refs.)

114796 Birefringence and ferroelectric properties of $[Rb_x(NH_4)_{1-x}]_2SO_4$. N.R.Ivanov, V.N.Anisimova, L.A.Shuvalov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.296-9 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.525-31 (Feb. 1983). [received: Sept. 1983]
The temperature dependences of the birefringence, permittivity, and spontaneous polarization of $[Rb_x(NH_4)_{1-x}]_2SO_4$ mixed crystals with $x=0.4$ were studied, and their behavior near the ferroelectric second-order phase transition at $T_c=-74.5^\circ C$ was analyzed. The paraelectric phase shows anomalies of the permittivity and the birefringence that are not due to phase transitions. The ferroelectric and electrooptic properties are discussed in terms of a two-sublattice phenomenology model. It is shown that a tricritical transition should occur at atmospheric pressure in the $[Rb_x(NH_4)_{1-x}]_2SO_4$ system when $x=0.22\pm0.03$. (19 refs.)

114797 Free energy of a tetragonal ferroelectric in the region of strong critical fluctuations. A.I.Sokolov (V.I. Ulyanov Inst. of Electrical Engng., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.311-13 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.552-6 (Feb. 1983). [received: Sept. 1983]
Critical thermodynamics of an 'easy-plane' tetragonal ferroelectric is studied theoretically. The free energies of the orthorhombic and monoclinic ferroelectric phases are determined as functions of the modulus of the order parameter from the summation of ring diagrams. The equations of binodals and over-heating spinodals and also the discontinuities of the spontaneous polarization on these curves, are determined. (6 refs.)

114798 Incommensurate phase in an external field. D.G.Sannikov (Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.352-3 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.616-18 (Feb. 1983). [received: Sept. 1983]
The author shows that a transition between soliton states can be achieved by varying only the temperature in a crystal subjected to an external electric field of appropriate symmetry (and under a mechanical stress). He considers the simplest form of the free energy which describes, in particular, initial-incommensurate-commensurate phase transitions in ferroelectric ammonium fluoroberyllate. (3 refs.)

114799 Stress relaxation in ferroelectric materials. V.C.S.Prasad (Materials Dev. Lab., Bharat Electronics Ltd., Bangalore, India). *Bull. Mater. Sci. (India)*, vol.5, no.1, p.71-7 (March 1983). [received: Sept. 1983]
Stress relaxation takes place in BaTiO₃ type ferroelectric materials due to the motion of non 180° domain boundaries, which are the twin boundaries. The nature of stress relaxation taking place due to plastic deformation in crystalline solids and that due to twin boundaries in ferroelectric materials is discussed. The usefulness of the stress relaxation data for the study of domain wall motions in this type of ferroelectric is pointed out. (20 refs.)

114800 Domain structure of heteroepitaxial ferroelectric Ba_{0.5}Sr_{0.5}TiO₃ films produced by RF cathode sputtering. V.A.Aleshin, V.S.Mukhortov, M.Mukhortov, Yu.I.Golovko, V.I.M.Mukhortov, A.T.Piralo, V.P.Dudkevich, E.G.Fesenko (Sci.-Res. Inst. of Phys., State Univ., Rostov-on-Don, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.350-1 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.612-14 (Feb. 1983). [received: Sept. 1983]
The method of Mukhortov et al. (1979) was used to produce films on (100) cleavage planes of MgO crystals (cubic system, $a=4.211\text{ \AA}$), but with a wider variation in the deposition parameters. The fact of epitaxial growth and the relative orientations of the films and substrates were established by X-ray diffraction methods on a DRON 3.0 diffractometer (Cu K α , Fe K α) and in a Lang reflection arrangement (Cu K α). In all cases in which epitaxial growth occurred the authors observed a completely parallel orientation. At room temperature the films were tetragonal, with $(c/a-1)=(5.6\pm0.6)\times10^{-3}$ and with the crystallographic axis c perpendicular to the substrate. In this direction the microdeformations of the second kind, $\Delta c/c$, varied from 0.001 to 0.010 depending on the conditions under which the films were formed, and the

dimensions of the coherent-scattering regions were always larger than 1000 Å, i.e. could not be measured by X-ray methods. (6 refs.)

77.90 OTHER TOPICS IN DIELECTRIC PROPERTIES AND MATERIALS

114801 On the dissociation conductivity of fluid dielectrics. A.I.Zhakin, I.E.Tarapov.

Elektron. Obrab. Mater. (USSR), no.3, p.46-50 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*

The results are given of theoretical studies of relaxation and concentration effects in fluid dielectrics in the presence of dissociation conductivity. It is suggested that ionization of the fluid occurs in consequence of the dissociation of neutrals, the ions thus formed possessing the power to recombine. It is shown that the transient process is characterized by two distinct periods of time: τ_x , the time occupied by the reaction dissociation \rightleftharpoons recombination to reach equilibrium, and τ_d , the time needed for establishment of an equilibrium concentration in the inter-electrode region. Evaluative expressions are obtained for τ_x and τ_d , from which it follows that, for the case of a low degree of dissociation and inter-electrode distances of ~ 1 cm, τ_d is of the order of tens of hours. It is shown that in strongly heterogeneous external fields the ohmic law of conductivity is not obeyed. In the neighborhood of the electrodes only a heterocharge can form, and hence dissociation conductivity cannot be the cause of the development of electroconvective movement. (9 refs.) *A.J.B.*

114802 Differential polarization spectroscopy on single crystals of transition metal complexes. H.P.Jensen (Chem. Dept. A, Tech. Univ. of Denmark, Lyngby, Denmark).

Appl. Spectrosc. Rev. (USA), vol.18, no.3, p.305-27 (1982-1983). [received: Sept. 1983]

The purpose of the review is to solidify the status of the Jones matrix method; to discuss the transformation of the two-dimensional Jones matrix into a corresponding four-dimensional Mueller matrix which can be used in differential polarized absorption spectroscopy based on phase modulation; and to demonstrate the success, power, and limitations of the matrix algebraic methods when used on anisotropic media, especially anisotropic crystals of transition metal complexes. (83 refs.)

114803 Optical properties of small metallic particles in a continuous dielectric medium. A.Liebsch (Inst. fur Festkörperforschung, KFA, Jülich, Jülich, Germany), B.N.J.Persson.

J. Phys. C (GB), vol.16, no.27, p.5375-91 (30 Sept. 1983).

The dielectric function of an inhomogeneous system consisting of small particles in a dielectric host material is investigated using a lattice gas model to describe the topological disorder among the particles. By applying the coherent potential approximation, an effective single-particle polarizability is found, which contains the influence of the local electric fields arising from randomly distributed particles. In the Maxwell-Garnett theory it is assumed that these fields in a random distribution of dipoles are the same as those calculated for a cubic array of dipoles. The disorder is shown to give a substantial red shift of absorption peaks and a comparable blue shift of loss lines. Moreover, absorption as well as loss features are very strongly broadened. These kinds of shifts and enhanced linewidths have been observed experimentally for many systems. A detailed comparison with measured spectra is given for silver particles immersed in a gelatin matrix. (47 refs.)

114804 Properties of semidilute polymer solutions: investigation of an optically labeled three-component system. D.B.Cotts (Polymer Sci. Dept., SRI Internat., Menlo Park, CA, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1381-8 (Aug. 1983).

A three-component system containing a polymer (2), a good solvent (1) for that polymer, and a second polymer (3) that is compatible with component (2) and isorefractive with the solvent (1) has been studied by static and dynamic light-scattering methods. In concentrated toluene (1) solutions of poly(vinyl methyl ether) (3), where appreciable chain overlap occurs and excluded-volume effects are reduced, polystyrene (2) may be studied in the dilute-solution limit. Consequently, these light-scattering measurements provide an explicit measure of both thermodynamic and hydrodynamic changes that occur as the total polymer concentration is increased from dilute to concentrated solution. Precise numerical coefficients, correct scaling exponents, the radius of gyration, and the effective hydrodynamic radius can be measured directly along with the observation of long-wave single-chain reptation motions and short-range cooperative motions in semidilute and concentrated solutions. (10 refs.)

114805 Influence of solid support sorptive properties on the colour of cholesteric liquid crystals. II. Quantitative results. T.Skoulidakis, M.Koui (Lab. of Phys. Chem. & Appl. Electrochem., Nat. Tech. Univ. of Athens, Athens, Greece).

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.323-8 (1983).

For pt.I see *ibid.*, vol.61, p.31 (1980). Quantitative measurements (visible diffuse reflectance spectroscopy) at several temperatures on bare metal (Zn, Fe, Cu, Al) surfaces mechanically treated, on chemically and electrolytically prepared ZnO and Fe₂O₃, on electrolytically prepared γ_1 - and γ_2 -Al₂O₃, on copper surfaces electroplated with copper and on electrolytically prepared γ_1 -Al₂O₃ under several current densities, covered with the same mixture of cholesterics as the one used in part I, were carried out. Thus, the results of

the visual observations of the previous work were checked and the following relationship between the reflected wavelength at the peaks (λ) from the examined cholesteric system on γ_1 -Al₂O₃ and on blackened glass (λ') and the physical sorptive abilities of the γ_1 -Al₂O₃ (s') as a function of temperature [$T(K)$] was temporarily established. (27 refs.)

114806 Inhomogeneous and 'lost' optical waves in a bounded anisotropic crystal and supplementary boundary conditions in the theory of additional optical waves. S.I.Pekar, V.I.Pipa (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.206-11 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.366-75 (Feb. 1983). [received: Sept. 1983]

It is shown that an inhomogeneous optical wave with complex projections of the wave vector k and $k^2=0$ is important in optical perturbation of a bounded crystal. The amplitude of such a wave can be expressed in terms of the amplitudes of ordinary optical waves in any frequency range of the spectrum. The supplementary boundary conditions are generalized for narrow spectral regions of exciton resonances in which additional optical waves occur. This makes it possible to satisfy the supplementary boundary conditions in the most general case, provided the aforementioned inhomogeneous wave is included. It is also possible to determine the reflection and transmission coefficients of light for the vacuum-crystal interface. The problem can be solved only in the limiting cases of large and small ratios of the width of an exciton band to the longitudinal-transverse splitting. (15 refs.)

114807 The effect of the microscopic structure of metal surfaces on their optical properties. A.M.Brodskii, M.I.Urbakh (Inst. of Electrochem., Acad. of Sci., USSR).

Sov. Phys.-Usp. (USA), vol.25, no.11, p.810-32 (Nov. 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.138, no.3, p.413-53 (Nov. 1982). [received: Sept. 1983]

This review treats the current state of studies on the optical properties of metal surfaces. The authors discuss the use of the theory developed in recent years for describing the results of concrete experiments in modulation spectroscopy of surfaces. They especially examine the dependence of the surface-plasmon spectrum on the microscopic structure of the surface. They describe how one can obtain information from the data of optical measurements on the electronic structure of the surface, and in particular, they discuss the effect of adsorption on this structure. The review of the literature covers the period to the end of 1980. (206 refs.)

78.20B General theory (for pure homogeneous materials)

114808 Light scattering by free holes in semiconductors with a complex valence band. V.A.Voitenko, I.P.Ipatova, A.V.Subashiev (A.F. Ioffe Physico-techn. Inst., Acad. of Sci., Leningrad, USSR).

JETP Lett. (USA), vol.37, no.7, p.396-400 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.334-7 (5 April 1983). [received: Oct. 1983]

A new unscreened mechanism for light scattering by free holes has been found in semiconductors with a valence band of symmetry Γ_8 . This scattering results from fluctuations in the density of the quadrupole moment of the holes. Although heavy holes do the scattering, the mass of the light holes determines the Thomson cross section. (8 refs.)

114809 Modification of optical properties of GaAs-Ga_{1-x}Al_xAs superlattices due to band mixing. Yia-Chung Chang (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), J.N.Schulman.

Appl. Phys. Lett. (USA), vol.43, no.6, p.536-8 (15 Sept. 1983).

A theoretical calculation of the optical properties of GaAs-Ga_{1-x}Al_xAs superlattices is presented. The calculation includes the detailed atomic nature of the superlattice electronic states in a realistic tight-binding model. It is found that the mixture of the bulk heavy hole and light hole states in the superlattice wave function substantially affects the optical properties. (20 refs.)

114810 Dynamical conductivity and dielectric function of general semiconductors and of magnetic semiconductors. P.Grosse (I. Phys. Inst., Rheinisch-Westfälischen Tech. Hochschule, Aachen, Germany).

Acta Polytech. Scand. Electr. Eng. Ser. (Finland), no.EL50, p.47-101 (1983). (Proceedings of Helsinki International Summer School on Semiconductors 1982, Espoo, Finland, 14-18 June 1982).

Considers the contribution of conduction electrons and holes to the optical properties of semiconductors and semimetals. These studies lead to more detailed information about the dynamics of 'free electrons' and the related scattering mechanisms than DC-measurements. In principle such information is also available from 'time resolved' transport measurements, but in this case a time resolution < 1 ps would be necessary e.g. to observe the current j as the response to a step of the field E . Another successful method is the study of nonlinear transport and experiments with 'hot electrons'. More efficient than these two transport measurements is the study of the 'dynamical conductivity' $\sigma(\omega)$, which is—roughly speaking—the Fourier-transform of the response function of the time resolved measurements. The experiments carried out with frequencies in the microwave range (1 cm) up to infrared (10 μ m) correspond to a time resolution from 3×10^{-11} s up to 3×10^{-15} s. The author also considers the contribution of electrons, trapped by defects, since they act as very high polarizable centers. A local-field-coupling of these dipoles to the long wavelength, polar optical phonons may explain the dependence of the reststrahlen bands on the magnetic order as found in some magnetic semiconductors. (16 refs.)

114811 Interpretation of the refractive and rotary dispersion of crystalline LiIO₃. M.S.Madhava, C.Satyanarayana (Dept. of Phys., Univ. of Mysore, Mysore, India).

Curr. Sci. (India), vol.52, no.13, p.632-3 (5 July 1983).

Lithium iodate (LiIO₃) belongs to the pyramidal class 6 of the hexagonal system, with space group P6₃ exhibiting high optical activity. Because of their very good optical quality, these crystals have been of considerable interest. Umegaki et al. (1971) have measured the refractive indices for both the ordinary (n_0) and extraordinary (n_e) rays in the spectral range 0.4047 μ to

2.2493 μ to an accuracy of ± 0.0001 in the visible region and ± 0.0003 in the near infrared region. The refractive dispersion can be explained by the Sellmeier-Drude (S-D) type formula. The authors have fitted the experimental data using the three-term S-D formulae. (9 refs.)

114812 Direct intersubband optical absorption of semiconductor thin wire. J.Lee (GTE Labs., Waltham, MA, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.5482-4 (Sept. 1983).

The optical absorption due to direct intersubband transitions and including the broadening effects has been calculated by using an electric dipole approximation for a quasi-one-dimensional semiconductor thin wire. Effective mass approximation is adopted to determine the eigenfunctions and energies of the conduction electrons in Schrodinger equation by assuming a two-dimensional infinite potential well. When the electromagnetic wave is polarized in a \hat{z} direction which possesses a size-quantization effect in the thin wire, the selection rule requires that the sum of the quantum numbers of the initial state and final state must be odd integers. AC and DC conductivities, and the absorption line shapes due to collisions are discussed. (18 refs.)

114813 Absorption of picosecond light pulses in semiconductors. S.E.Kumekov, V.I.Perel' (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

JETP Lett. (USA), vol.37, no.7, p.358-61 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.302-5 (5 April 1983). [received: Oct. 1983]

The absorption is calculated for the case in which thermodynamic equilibrium can be reached in the system of free charge carriers during the pulse, but recombination and electron-phonon interactions cannot occur. The analysis is based on Galitskii-Goreslavskii-Elesin quasiparticles. (7 refs.)

114814 New quantum form of the equation of the normals for biaxial crystals. F.I.Fedorov.

J. Appl. Spectrosc. (USA), vol.37, no.6, p.1379-85 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.941-9 (Dec. 1982). [received: Sept. 1983]

Theories of the optical properties of biaxial crystals are distinguished by their great complexity in comparison with the corresponding theories for uniaxial crystals, not to mention isotropic media. The main reason for this is the relative complexity of the basic equation describing the laws of plane-wave propagation in biaxial crystals, the so-called equation of the normals. This equation determines the dependence of the refractive indices of the two waves propagating in the crystal with a specified direction of the wave normal (isonormal waves). It was first obtained by Fresnel in the system of principal axes of the dielectric tensor ϵ . This equation reduces to a universal covariant form independent of the choice of coordinate axes. (7 refs.)

114815 Investigation of the refractive indices of LaF₃, CeF₃, PrF₃ and NdF₃. R.Laiho, M.Lakkisto (Wilhuri Phys. Lab., Univ. of Turku, Turku, Finland).

Philos. Mag. B (GB), vol.48, no.2, p.203-7 (Aug. 1983).

Values of the ordinary and extraordinary refractive indices of LaF₃, CeF₃, PrF₃ and NdF₃ single crystals were determined in the visible and the near-ultraviolet regions. The dispersion of the indices was analysed by using a single-effective oscillator model. The energy of the oscillator agrees well with the first strong peaks in the reflectance spectra of these crystals. (12 refs.)

114816 Free-carrier multiphoton laser absorption in magnetic semiconductors. O.A.C.Nunes (Dept. de Fisica, Univ. de Brasilia, Brasilia, Brazil). *Solid State Commun. (USA)*, vol.47, no.11, p.873-5 (Sept. 1983).

The magnon scattering by free carriers in the presence of an intense laser field is discussed. A kinetic equation for electrons is derived from which the multiphoton absorption coefficient is calculated. It is found that for very large fields the absorption coefficient is vanishing small. A physical explanation of this result is also available. (11 refs.)

114817 Comment on the optical absorption edge in a-Si:H. C.B.Roxlo, B.Abeles, C.R.Wronski, G.D.Cody, T.Tiedje (Corporate Res., Exxon Res. & Engng. Co., Linden, NJ, USA).

Solid State Commun. (USA), vol.47, no.12, p.985-7 (Sept. 1983).

The optical absorption edge of undoped amorphous silicon hydride has been measured using optical transmission, photoconductivity, and photothermal deflection spectroscopy. The results obtained by these techniques agree in the exponential edge region. An apparent inconsistency pointed out by Redfield (1982) between the optical absorption edge and the valence band tail density of states as measured by drift mobility is attributed to the nonexponential behavior of the absorption edge above $\alpha \sim 10^3 \text{ cm}^{-1}$. (16 refs.)

114818 Fundamental absorption of test radiation in a semiconductor subjected to the field of a strong electromagnetic wave. S.E.Kumekov (Technol. Inst. of Light & Food Industry, Dzhambul, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.273-5 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.441-5 (March 1983). [received: Sept. 1983]

A theoretical study is made of the absorption of a weak electromagnetic wave in a semiconductor subjected to a strong electromagnetic field. A general expression is obtained for the absorption coefficient k of the weak test wave and this expression is used to analyze the dependence of k on the method of application and intensity of the strong wave, on the frequencies of the strong and test waves, and on the state of their polarizations. The dependences are essentially different for the abrupt and adiabatic applications of the strong field and they are influenced by the state of saturation. (7 refs.)

114819 Dispersion of the refractive index of light exhibited by Cd_{0.9}Hg_{0.1}-Te epitaxial films. V.G.Sredin.

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.328 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.523-4 (March 1983). [received: Sept. 1983]

The author reports the results of a calculation of the dispersion of the refractive index $n(\hbar\omega)$. The calculations were performed for Cd_{0.9}Hg_{0.1}-Te epitaxial films. (7 refs.)

114820 Calculation of optical anisotropy of hydrocarbon chains by the Monte Carlo method. P.G.Khalatur, Yu.G.Papulov, A.S.Pavlov (Kalinin State Univ., Kalinin, USSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.683-5 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.740-2 (Nov.-Dec. 1982). [received: Sept. 1983]

The optical anisotropy of straight chain hydrocarbons (n-alkanes) present in a solution or in a gaseous phase is a value averaged with respect to all of the possible conformations in the molecule, formed during the rotations around C-C bonds. The main drawback of previous investigations is the neglect of the inherent volume of the molecules, as the result of which, during the conformational changes, the chains could intersect themselves, which in fact does not occur. Meanwhile, it is clear the forbidding of self-intersections should considerably decrease the number of the possible conformations of the chains, and thus influence their optical anisotropy. This fact is taken into account in the authors investigation, in which the results of the calculations of $\langle \gamma^2 \rangle$ for

chains with $n=10-32$ are given within the bounds of the valent-optical scheme by means of the Monte Carlo method. (8 refs.)

78.20E Optical rotatory power

114821 Pretransitional anomalies in the rotation of the plane of polarization of light in ferroelectric liquid crystals. E.I.Demikhov, V.K.Dolganov, V.M.Filev (Inst. of Solid State Phys., Acad. of Sci., USSR).

JETP Lett. (USA), vol.37, no.7, p.361-5 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.305-8 (5 April 1983). [received: Oct. 1983]

It is observed that the sign of the fluctuation contribution to the rotation in the smectic A phase differs from the sign of the rotation in the smectic C* phase and isotropic phase. A theoretical explanation of the observed anomaly is given. (7 refs.)

114822 Propagation of light in cholesteric liquid crystals with frequency dispersion. I.V.Semchenko, A.N.Serdyukov.

J. Appl. Spectrosc. (USA), vol.37, no.5, p.1316-19 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.836-9 (Nov. 1982). [received: Sept. 1983]

The authors investigate the effect of dispersion of ϵ on propagation of light along the axis of a cholesteric helix and show that in several cases dispersion can lead to a qualitative change in gyrotropy and Bragg reflection in a cholesteric liquid crystal. (9 refs.)

(inc. stress birefringence, flow birefringence, etc)

114823 Optical and Mossbauer spectra of manganese-bearing phlogopites: Fe_{1/3}³⁺-Mn_{2/3}²⁺ pair absorption as the origin of reverse pleochroism. G.Smith (Inst. fur Mineralogie und Kristallographie, Tech. Univ. Berlin, Berlin, Germany), U.Halenius, H.Annersten, L.Ackermann.

Am. Mineral. (USA), vol.68, no.7-8, p.759-68 (July-Aug. 1983).

Eight manganese-bearing phlogopites have been studied by means of X-ray powder diffraction, electron microprobe techniques, Mossbauer spectroscopy and single crystal optical absorption spectroscopy. The different types of spectra were measured at room temperature and at liquid nitrogen temperature. The major differences in sample 3d-element chemistry are variations in [Mn²⁺]/[Fe³⁺] and [Fe_{IV}³⁺]/[Fe_{VI}³⁺] ratios. Samples containing Mn_{VI}²⁺ and Fe_{VI}³⁺ are normal pleochroic, while samples containing Mn_{VI}²⁺ and Fe_{IV}³⁺ are reverse pleochroic. These chemical and optical differences are reflected by pronounced variations in the shape and band content of the optical absorption spectra. (31 refs.)

114824 Photoelasticity of KH₂PO₄, KD₂PO₄, and RbH₂PO₄. L.P.Avakyants, D.F.Kiselev, N.V.Perelomova, V.I.Sugrei (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.25, no.2, p.329-30 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.580-2 (Feb. 1983). [received: Sept. 1983]

Ferroelectric crystals of the KDP series are widely used in modern electrooptic and acoustooptic devices. In order to calculate the efficiency of these devices, to study the anisotropy of the elastooptic effect, to determine the contribution of the secondary electrooptic effect, and to solve a number of other problems it is necessary to have the complete matrix of photoelastic constants $P_{\alpha\beta}$, and here it is important to know not only the absolute values but also the signs of all the $P_{\alpha\beta}$. The authors determine the signs and magnitudes of all the $P_{\alpha\beta}$ for KDP, DKDP, and RDP by a Brillouin-scattering method and to study the influence of $P_{(ij)(kl)}$ on the intensity of the Brillouin-scattering. - 114826 Electrochromism for organic materials in polymeric all-solid-state systems. Y.Hirai, C.Tani (Opto-Electronics Res. Labs., NEC Corp., Kanagawa, Japan). *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.704-5 (1 Oct. 1983).
- Reports a new electrochromic polymeric film system consisting of a polymer, an electrochromic (EC) dye which is pyrazoline or tetrahydrofulvalene (TTF), and lithium perchlorate (LiClO_4). The electrochromic cell structure is glass/ITO/polymeric EC film/Au film. The cell using pyrazoline as an EC dye exhibited yellow coloration at 1.0 V and the cell with TTF exhibited red coloration at 3.5 V. These cells exhibited memory. (13 refs.)
- 114827 Linear electrooptic effect in doped KDP crystals. K.B.R.Varma (Dept. of Electrical Engng., Indian Inst. of Technol., Madras, India), K.V.Ramaniah, K.Veerabhadra Rao. *Bull. Mater. Sci. (India)*, vol.5, no.1, p.39-48 (March 1983). [received: Sept. 1983]
- The dispersion of half wave voltages with wave length and temperature of potassium dihydrogen ortho phosphate (KDP) crystals with additives and dopants like borax, nickel phosphate, manganese phosphate, sodium dihydrogen orthophosphate and potassium arsenate were determined. The refractive index for all the above crystals were found by the modified Rayleigh's refractometer method. The linear electrooptic coefficients were calculated at various wavelengths of light. The variation of half wave voltage was also studied as a function of concentration of the dopant. (8 refs.)
- 114828 Kerr electro-optic field mapping measurements in water using parallel cylindrical electrodes. M.Zhan, T.Takada, S.Voldman (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.4749-61 (Sept. 1983).
- An extensive set of Kerr electro-optic field mapping measurements are reported for highly purified water over the temperature range of 8.8-29.5°C. The Kerr constant is independent of temperature over this range and equals $B \approx 3.4 \times 10^{-14}$ m/V². Pulsed high voltages up to 140 kV across parallel cylindrical electrodes with a 1-cm gap are applied on millisecond time scales. For early times, the measured results agree with the space-charge-free electric field distribution while for times greater than 500 μs , there is significant space-charge distortion due to positive charge injection. (4 refs.)
- 114829 Electromodulation spectra of high-resistance p and n GaAs doped with chromium. V.A.Morozova, V.V.Ostrobodova (Dept. of Semiconductor Phys., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.77-80 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.67-9 (1983).
- From the electromodulation spectra of high-resistance p and n GaAs doped with chromium, the ionization energies of the acceptor levels of chromium are determined. They are $\epsilon_{\text{AV}} = 0.61 \pm 0.01$ eV and $\epsilon_{\text{AV}} = 0.870 \pm 0.005$ eV and are independent of the temperature in the range 80-300K. (17 refs.)

Tverd. Tela (USSR)*, vol.25, no.2, p.359-65 (Feb. 1983). [received: Sept. 1983]
- Results are reported from a study of the electrooptic and elasto-optic effects and the quadratic electrooptic effect under uniaxial compression in lead magneto- and zinconibate-ferroelectrics with a diffuse phase transition—for the case of static stresses and electric fields. These results are compared with those of a model calculation for weakly interacting birefringent polar regions and are discussed in terms of a model in which the diffuse phase transition is due to fluctuations of the composition in the presence of a partially ordered distribution of ions of different valencies in the octahedral positions in the lattice. 78.20L Magneto-optical effects

- 114831 Magnetic fluid's anomalous pseudo-Cotton Mouton effects about 10^7 times larger than that of nitrobenzene. S.Taketomi. *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.7, p.1137-43 (July 1983).
- The magneto-birefringence of magnetic fluid thin films of 12 μm and 25 μm were studied and anomalous phase differences were found when an external magnetic field was applied normal to the direction of light propagation. The order of the phase differences of the films was about 10^7 times larger than that of nitrobenzene, which is known to show a large Cotton-Mouton effect. The author attributes these phenomena theoretically to a rod-like chain formation of the ferrite particles in the magnetic fluid thin films and derives expressions for the phase difference and absorption. There is a definite difference in the H- δ curves between the theory and experiment in the rising gradient near H=0. (13 refs.)
- 114832 Influence of compositional variations in thin solid $\text{Pb}_{1-x}\text{Br}_x$ films on their excitonic spectra. V.V.Mussil, V.K.Miloslavskii, V.Kenig (V.I. Lenin Khar'kov Polytech. Inst., USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1350-5 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1577-82 (Sept. 1982). [received: Sept. 1983]
- Using the Faraday rotation method the authors have studied the exciton spectrum of the hexagonal phase of $\text{Pb}_{1-x}\text{Br}_x$ solid solutions in the region of x values from 0 to 0.2 at 90K. As x increases a frequency shift of the exciton peak is observed, which obeys a linear law for $x \leq 0.10$, along with a change in its shape. It has been shown that the dependence of the exciton peak shape upon composition may not be explained by its broadening in a homogeneous solid solution and is due instead to a nonlinear change in composition over the thickness of the sample. They have calculated the spectral dependence of the Verde constant taking into account parameters which describe a significant concentration variation. (16 refs.)
- 114833 Magnetic circularly polarized luminescence as a probe of ligand fields in the solid state and in solution. D.Foster, F.S.Richardson (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.236 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
- Summary form only given, as follows. Magnetic circularly polarized luminescence (MCPL) refers to the differential (spontaneous) emission of left versus right circularly polarized light by luminescent systems placed in a static magnetic field. The MCPL experiment involves the measurement of this differential emission along a direction parallel to the direction of the externally applied magnetic field. The shapes, signs, intensities and splitting patterns of the lines observed in the MCPL spectra of lanthanide 4f-4f transitions are sensitive probes of coordination geometry, lanthanide-ligand interactions and the magnetic properties of the (4f)ⁿ electronic states. Experimental data are reported for a variety of europium(III) systems in crystals and in solution media, and these data are analyzed in terms of ligand structure, coordination geometry and the (4f)ⁿ electronic properties of europium(III). (no refs.)

78.30 INFRARED AND RAMAN SPECTRA AND SCATTERING

- 114835 The study of antimony (V) chloride adducts by vibrational spectroscopy. Y.Gushikem, O.L.Alves (Inst. de Quimica, Univ. Estadual de Campinas, Campinas, Sao Paulo, Brazil). *An. Acad. Bras. Cienc. (Brazil)*, vol.55, no.2, p.179-82 (June 1983).
- The SbO frequencies and the SbO stretching force constants K_{SbO} increase from the POCl_3 complex to the $(\text{Me}_2\text{N})_2\text{PO}$ complex, i.e. in the same order as increase in the donor number of the ligands. An apparent discrepancy is observed for the Cl_2SeO and Me_2SO complexes taking into account their relative position in the donor number scale. In this case the correlation is reasonable considering the approximated model used to calculate the force constants. (14 refs.)
- 114836 A new interpretation of spectral data on $\text{SbCl}_5\text{OSeCl}_2$. O.L.Alves (Inst. de Quimica, Univ. Estadual de Campinas, Sao Paulo, Brazil), Y.Hase. *An. Acad. Bras. Cienc. (Brazil)*, vol.55, no.1, p.27-31 (March 1983). [received: Sept. 1983]
- The laser Raman spectra of $\text{SbCl}_5\text{OSeCl}_2$ have been reexamined in the 850-50 cm^{-1} region for crystalline and molten states. Taking the relative intensity changes of the ligand bands due to the phase transition and the optical activities of the skeletal fundamentals into consideration, a new inter-

pretation of the spectral data is presented for the vibrational band assignments. (14 refs.)

114837 Comment on 'Raman scattering with nanosecond resolution during pulsed laser annealing of silicon'. D.von der Linde, G.Wartmann (Fachbereich Phys., Univ. Essen, Essen, Germany), A.Compaan. *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.613 (15 Sept. 1983). For original paper see von der Linde and Wartmann, *ibid.*, vol.41, p.700 (1982). von der Linde and Wartmann reported time-resolved Raman measurements of the optical phonon population in Si during intense excitation with a 10-ns pulse at 532 nm. The results indicated a phonon temperature in excess of the melting temperature for a UV Raman probe ($\lambda=355$ nm), but a different, much lower temperature for a Raman probe in the visible ($\lambda=532$ nm). The authors show data confirming the supposition that this difference arises from the temperature dependence of the factors which correct for absorption and resonance Raman effects. (5 refs.)

114838 Surface effects of Raman scattering from semi-metal Sb deposited on island Ag films. N.T.Liang (Inst. of Phys., Acad. Sinica, Taipei, Taiwan), T.T.Chen, Hua Chang, Y.C.Chou, Shou-Yih Wang. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.245 (Dec. 1982). [received: Sept. 1983] Enhancement in Raman spectra (115 cm^{-1} and 150 cm^{-1}) of crystalline Sb deposited on island silver films has been observed. The excitation profiles, as well as the dependence of Raman intensity on the thickness of Ag films, were similar to the surface enhanced Raman scattering (SERS) from molecules adsorbed on rough Ag surface. This is the first observation of SERS from crystal vibrational modes rather than the vibrations of individual molecules. (no refs.)

114839 Observations of crystalline and amorphous Sb films by Raman scattering. N.T.Liang (Inst. of Phys., Acad. Sinica, Taipei, Taiwan), Y.C.Chou, Shou-Yih Wang, Hua Chang. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.246 (Dec. 1982). [received: Sept. 1983]

The authors have observed Raman spectra (145 cm^{-1}) of 50–200 Å amorphous Sb films and the crystalline peaks ($115, 150\text{ cm}^{-1}$) of 10–20 Å annealed Sb films. Also observed was the transition to crystal when a silver overlayer was deposited on an amorphous Sb film. This same phenomena was not found for Al overlayers, so that the conjecture of this transition being originated by a temperature effect during deposition was ruled out. The determination of phase change in such thin films via conventional electron diffraction or other methods is very difficult and has not been reported before. (no refs.)

114840 Absorption and surface-enhanced Raman spectra of silver organosols in ethanol. O.Siiman, A.Lepp, M.Kerker (Dept. of Chem., Clarkson Coll. of Technol., Potsdam, NY, USA). *Chem. Phys. Lett. (Netherlands)*, vol.100, no.2, p.163-8 (2 Sept. 1983). Colloidal silver, dispersed in ethanol and stabilized by adsorbed polymer, shows enhanced Raman scattering of the chromophore dabsyl (N-4-dimethylaminoazobenzene-4'-sulfonyl) aspartate, DABS ASP, in the presence of excess base. The requirement of the base appears linked to the adsorption of the dabsyl aspartate by interaction with the polymer and/or promotion of growth and aggregation of the silver particles. The latter conditions are indicated by changes in the absorption spectrum of the sol upon addition of base. The enhancement is comparable to that observed earlier for DABS ASP on colloidal silver in aqueous medium. (35 refs.)

114841 Fermi resonance effect and vibrational intensity in the weak charge-transfer complexes. C.T.Lin, C.A.Caetano, T.D.Z.Atvans (Inst. de Química, Univ. Estadual de Campinas, Campinas, Brazil). *Chem. Phys. Lett. (Netherlands)*, vol.100, no.2, p.169-73 (2 Sept. 1983). Infrared and Raman spectra of naphthalene, tetrachlorophthalic anhydride, tetrabromophthalic anhydride and their respective weak charge-transfer complexes were recorded in solids. The spectral intensities of both donor and acceptor molecules were found to alter drastically upon complexation. The observed intensity changes might be attributed to the removal and formation of the Fermi resonance effect in the complexes. (12 refs.)

114842 Low frequency infrared spectra of copper(II) pyridine N-oxide complexes. A.Malek, J.Fresco (Chem. Dept., McGill Univ., Montreal, Canada). *Chem. Scr. (Sweden)*, vol.22, no.3, p.146-51 (1983). The infrared spectra of 1:1 copper(II) pyridine N-oxide complexes have been recorded and the copper-oxygen vibrational frequencies assigned. These frequencies occur in the same region as that of the corresponding 1:2 complexes. Since the bridging frequencies of the 1:1 complexes occur at higher values than expected, the enhanced bonding could arise in part from superexchange. (33 refs.)

114843 Raman spectroscopic study on molten polyethylene under high pressure. H.Tanaka, T.Takemura (Dept. of Appl. Sci., Kyushu Univ., Fukuoka, Japan). *Jpn. J. Appl. Phys. Part I (Japan)*, vol.22, no.6, p.1001-4 (June 1983). Raman spectral changes of the C-H stretching modes of polyethylene during melting at high pressures up to 5000 kg/cm² were observed in detail and are explained in terms of changes in the intra- and interchain structures. It was found that the peak height ratio $r=(2890)/I(2850)$ in the molten state increases, and the upward shift of the 2890 cm⁻¹ band upon melting decreases with increasing pressures. Several confirmations of the effects of intra- and interchain disordering on the ratio and the upward shift were obtained from other experimental results. It is suggested from these facts that the degree of intrachain regularity in the molten state increases with increasing pressure, and that this should contribute to the formation of extended-chain crystals under high pressure. (18 refs.)

114844 Raman spectra of rhombohedral and α -monoclinic selenium under high hydrostatic pressure. K.Nagata, T.Isikawa, Y.Miyamoto (Dept. of Appl. Phys., Fukuoka Univ., Fukuoka, Japan). *Jpn. J. Appl. Phys. Part I (Japan)*, vol.22, no.7, p.1129-32 (July 1983). The Raman spectra of rhombohedral, α -monoclinic, and trigonal selenium have been measured under high hydrostatic pressures up to about 8 kbar at room temperature. The frequencies of the A₁-type stretching modes in both rhombohedral and α -monoclinic selenium have been observed to decrease with increasing pressure, as has that of trigonal selenium. This indicates that interference between inter- and intramolecular bonding also exists in crystals composed of ring molecules such as Se₆ or Se₈. (16 refs.)

114845 Optical determination of the electronic characteristics of Nb-Al alloys with the A15 lattice. N.D.Kuz'michev, I.S.Levchenko, G.P.Motulevich (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.266-70 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* The complex permittivity $\epsilon(\omega)=\epsilon_1(\omega)-i\epsilon_2(\omega)$ was determined for the Nb-Al alloy with the A15 lattice at temperatures 295 and 670K in the spectral range 3.1-0.18 eV. The characteristics of the conduction electrons and of the

three main bands due to interband transitions were determined. An increase in temperature from 295 to 670K increased the conduction electron density by a factor of 1.43 and the effective collision frequency ν by a factor of 1.25. The sum of the values of ω_p^2 for all the bands at 295 and 670K was 140 and 150 eV², which represented 0.39 and 0.42 of Ω_p^2 , respectively (Ω_p is the plasma frequency of all the valence electrons). This indicated the occurrence of important bands due to interband transitions at frequencies in the range $\hbar\omega>3$ eV, where \hbar is the Planck constant divided by 2π . (8 refs.) A.T.

114846 Optical properties of leucosapphire at high temperatures. II. Single-crystal properties in the opaque region and properties of the melt. Yu.K.Lingart, V.A.Petrov, N.A.Tikhonova (Inst. of High Temperatures, Acad. of Sci., USSR). *High Temp. (USSR)*, vol.20, no.6, p.856-62 (Nov.-Dec. 1982). Translation of: *Teplotiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1085-92 (Nov.-Dec. 1982). [received: Sept. 1983]

For pt.I see *ibid.*, vol.20, no.5, p.872 (1982). Experimental data on the indices of absorption and refraction of single-crystal leucosapphire are analyzed over the wavelength interval 6-33 μm at temperatures from room temperature to 1800K. From the collected data in the literature tables of recommended values are presented. The optical properties of molten aluminum oxide are examined. (19 refs.)

114847 Infrared properties of quartz fibres and wool. F.Thiebaud, F.K.Kneubuhl (Solid State Phys. Lab., ETH, Hoenggerberg, Zurich, Switzerland). *Infrared Phys. (GB)*, vol.23, no.3, p.131-48 (May 1983).

This experimental and theoretical study is devoted to the general infrared properties of dielectric fibres and wool with fibre diameters comparable to the infrared wavelengths. Amorphous quartz is used as the fibre material since its bulk infrared dispersion is known, and since it is suitable for the manufacture of thin fibres. Diffuse reflection, extinction and scattering including polarization phenomena of fibres and wools with fibre diameters between 1.8 and 9 μm are measured in the spectral region of 400 to 1400 cm⁻¹. The measured infrared properties of single quartz fibres agree with the theory of Englmann and Rupin (1968). Bulk and surface modes are observed. Thanks to the ideal geometry of the fibres the broadening of modes usually reported for small particles is not observed. The interpretation of the reflectivity spectra of wool is based on the Kubelka-Munk theory. Multiple scattering prevails. The introduction of an empirical factor connecting the ratio of absorption versus the scattering coefficient with the ratio of the efficiency factors for absorption and scattering allows one to predict in first approximation the spectral reflectivity of dielectric wool samples if the diameter distribution function of the fibres and the bulk i.r. dispersion are known. (43 refs.)

114848 Raman spectra of ⁷Li₂SO₄ and ⁶Li₂SO₄. E.Cazzanelli, R.L.Frech (Dept. of Chem., Univ. of Oklahoma, Norman, OK, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2615-20 (15 Sept. 1983). The polarized Raman spectra of single crystal ⁷LiSO₄ and ⁶Li₂SO₄ at room temperature are reported. Symmetry-based vibrational band assignments are given for the external and internal optic modes. Comparison of spectra from the two isotopically substituted crystals identifies higher frequency external modes originating in the lithium ion motion. The interaction of these modes with the intramolecular modes of the sulfate ion is discussed. (25 refs.)

114849 Ammonium ion rotation in ammonium perchlorate as studied by infrared spectroscopy. R.M.Corn, H.L.Strauss (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

J. Chem. Phys. (USA), vol.79, no.6, p.2641-9 (15 Sept. 1983). The infrared spectra of the ND-stretching bands of dilute NH₃D⁺ in NH₄ClO₄ are presented. The spectra are studied over the temperature range from 3K to room temperature. At low temperatures, the NH₃D⁺ is preferentially oriented. The extent of the orientation at a given temperature depends on the deuterium concentration and thus on the concentration of NH₃D⁺ ions. As the temperature is raised, the various ND-stretching bands collapse due to a variety of dephasing processes. At low temperature, the dephasing process is phonon-assisted tunnelling. As the temperature is raised, dephasing is accomplished by interaction among librational states. At still higher temperatures, the bandwidth is due to stochastic motion of the ammonium ions. (34 refs.)

114850 Infrared dephasing and libration motion in liquid methyl iodide. W.G.Rothschild, J.Soussen-Jacob, J.Bessiere, J.Vincent-Geisse (Lab. de Recherches Phys., Univ. Pierre et Marie Curie, Paris, France). *J. Chem. Phys. (USA)*, vol.79, no.6, p.3002-8 (15 Sept. 1983). A theoretical model of vibrational dephasing with motional narrowing by the librational motions of the molecules in their liquid cages is proposed and tested on the infrared ν_6 degenerate fundamental of liquid methyl iodide and perdeutero methyl iodide over a temperature range of -190 to +40°C. The theory, which does not require artificial separation of vibrational and orientational coordinates, is particularly applicable to associated and sterically hindered liquids. (26 refs.)

114851 The electronic structure of f element compounds elucidated by less common spectroscopic methods. H.-D.Amberger (Inst. für Anorganische und Angewandte Chem., Univ. Hamburg, Hamburg, Germany). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.235-6 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Summary form only given. During the last three decades Koningstein has demonstrated that electronic Raman transitions can often be observed in lanthanide compounds. As the electronic scattering tensor is of gerade parity, electronic Raman transitions are allowed even in centrosymmetric compounds. As no vibronic side bands have yet been observed, the electronic Raman spectra obtained reflect the underlying crystal field splitting patterns directly. The application of this effect to numerous quasi-octahedrally coordinated elpasolites of the type A₂BLnX₆ is reported. (no refs.)

114852 Low-frequency Raman scattering from methylene-oxyethylene-methylene triblock oligomers. T.G.E.Swales, H.H.Teo, R.C.Domszy, K.Viras, T.A.King, C.Booth (Dept. of Chem. & Phys., Univ. of Manchester, Manchester, England).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1501-11 (Aug. 1983). Low-frequency Raman spectra are reported for monodisperse methylene-oxyethylene-methylene triblock oligomers. Assignments are made to the longitudinal acoustical modes (LAMs) of the oxyethylene block and the methylene block. The results for LAM-1 can be modeled by the vibrations of rods with perturbing forces and masses. The results for LAM-3 are not so readily modeled. (18 refs.)

114853 Raman and infrared spectra of calcium and barium sulphamates. P.Muthusubramanian, A.Sundara Raj (School of Phys., Madurai Kamaraj Univ., Madurai, India). *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.221-4 (Aug. 1983). Raman spectra of a single crystal of calcium sulphamate and polycrystalline barium sulphamate have been recorded at room temperature. Infrared spectra

of polycrystalline calcium and barium sulphamates for the region 20-4000 cm^{-1} are also presented. The assignments made are supported by potential energy distribution calculations. The data show that there is no water of hydration in barium sulphamate. The N-S torsional mode is observed in both the compounds. This has not been found in other sulphamates of this family. The results indicate very weak hydrogen bonding in these crystals. (9 refs.)

114854 The hyper Raman spectra of some chloro- and bromo-methanes and some Group IV tetrachlorides. T.J.Dines, M.J.French, R.J.B.Hall, D.A.Long (School of Chem., Univ. of Bradford, Bradford, England). *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.225-31 (Aug. 1983). The hyper Raman and hyper Raman spectra of the following Group IV halides are reported: the liquids CCl_4 , CHCl_3 , CH_2Cl_2 , CHBr_3 , CH_2Br_2 , CH_3Br , SiCl_4 , GeCl_4 and SnCl_4 and CBr_4 in solution in CCl_4 . Relative hyper Raman and hyper Raman intensities and depolarization ratios have been measured. These are discussed and the intensities compared with those observed in Raman and infrared spectra. (10 refs.)

114855 Temperature dependence of the Raman active B_{3g} torsional mode of sulphamic acid. C.I.Ratcliffe, W.F.Sherman, G.R.Wilkinson (Dept. of Phys., King's Coll., London, England). *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.246-9 (Aug. 1983). The Raman active B_{3g} torsional mode of a single crystal of sulphamic acid has been observed as a function of temperature from liquid nitrogen to room temperature. The frequency decrease and markedly asymmetric broadening with increasing temperature have been characterized and are discussed. (21 refs.)

114856 A Raman study of solubilization of aromatics by non-ionic surfactants. R.P.Cooney (Dept. of Chem., Univ. of Newcastle, Newcastle, Australia), T.W.Healy, C.G.Barracough. *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.250-2 (Aug. 1983). Raman spectra of the aromatic solubilization in the ternary system, non-ionic surfactant aromatic water, are indicative of benzene in a hydrophobic liquid-like environment and of pyridine in a hydrophilic, possibly aqueous environment. The non-ionic surfactants studied were of the alkylphenol- and alkyl-polyoxyethylene type. Addition of traces of water to a solution of Triton X-100 in benzene leads to the appearance of a water spectrum which suggests that 1:1 hydrogen-bond complexes between individual ether groups of the polyoxyethylene chain and water have formed in reversed micelles. (7 refs.)

114857 Vibrational, resonance Raman and electronic spectra of the μ -oxo-bis[pentacyanomanganate(III)] ion. A.H.Jubert, J.A.Espindola, E.L.Varetti, P.J.Aymonino (Facultad de Ciencias Exactas, Univ. Nacional de La Plata, La Plata, Argentina). *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.259-63 (Aug. 1983). The resonance Raman spectra of the polycrystalline substance as well as the polarized infrared spectrum of an ordered array of small monocrystals were obtained for $\text{K}_3[\text{Mn}_2\text{O}(\text{CN})_{10}]\text{CN}$. Several of the bands observed in these spectra as well as in the electronic spectrum of the complex ion are assigned to expected transitions. (15 refs.)

114858 The polarized Raman spectra of CsCdCl_3 single crystals. M.H.Kuok (Dept. of Phys., Nat. Univ. of Singapore, Singapore). *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.264-5 (Aug. 1983). Raman scattering measurements on CsCdCl_3 single crystals have been made at 15K. First- and second-order phonon scattering are observed and the symmetry species of the first-order spectrum have been partly determined by means of polarization studies. (6 refs.)

114859 Vibrational spectra and force constants for trans-sodium hyponitrite. L.-H.Chen, J.Laane (Dept. of Chem., Texas A&M Univ., College Station, TX, USA). *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.284-7 (Aug. 1983). Laser Raman spectra of trans-sodium hyponitrite ($\text{Na}_2\text{N}_2\text{O}_2$) as a solid and in aqueous solution have been recorded, together with its infrared spectrum. Polarization data for the aqueous solution Raman spectra were also determined for the first time. The results confirm the trans structure of the hyponitrite ion and also have led to a new vibrational assignment. Force constant calculations have been carried out and these accurately predict the observed frequency shifts upon isotopic substitution. The potential energy distributions were also determined and these provide a useful picture of the coupling of the vibrational modes. (12 refs.)

114860 Study of uniaxially oriented isotactic polypropylene by the Raman effect: new results. L.D.Cambon, Luu Dang Vinh (Lab. de Spectroscopie Raman, Univ. des Sci. et Tech. du Languedoc, Montpellier, France). *J. Raman Spectrosc. (GB)*, vol.14, no.4, p.291-6 (Aug. 1983). In French. Heat-stretched samples of uniaxially oriented isotactic polypropylene were analysed by polarized Raman scattering. The authors inferred from a close observation of the spectra that lines can be classified into three groups. A theoretical analysis of the elements of derived polarizability tensors was elaborated and a hierarchy between these elements was specified for each group. These results allow the authors to improve and to extend previous assignments of isotactic polypropylene lines. (23 refs.)

114861 Low temperature Raman spectra of dibenzyl; comparison with biphenyl and paraterphenyl. A.Girard, M.Sanquer, G.P.Charbonneau (CNRS, Univ. de Rennes, Rennes, France). *Mol. Cryst. & Liq. Cryst. (GB)*, vol.95, no.3-4, p.237-47 (1983). The Raman spectra of crystal dibenzyl have been recorded from 293 down to 10K. No typical temperature dependence which usually accompanies phase transitions has been observed in frequencies, intensities or background. A comparison is made with biphenyl and paraterphenyl whose evolution of Raman spectra with the temperature looks similar. The very broad bands observed at room temperature result from the superposition of the different modes which appear well separated at 10K. This behaviour is consistent with the large atomic thermal motion observed by X-ray analysis. Vibrational frequencies have been calculated using the intermolecular potential of the atom-atom type in the rigid phenyl approximation and compared with experimental data. (23 refs.)

114862 Polymer deformation studies by time resolved Fourier transform infrared spectroscopy. J.E.Lasch, T.Masaoka, D.J.Burchell, S.L.Hsu (Dept. of Polymer Sci. & Engng., Univ. of Massachusetts, Amherst, MA, USA). *Polym. Bull. (Germany)*, vol.10, no.1-2, p.51-5 (June 1983). The authors have applied a newly developed time resolved Fourier transform infrared spectroscopy to follow microstructural changes in two semicrystalline polymers with time resolution in the order of milliseconds. This is a demonstration of a spectroscopic technique which is capable of measuring structural changes at the segmental level and relating them to macroscopic changes measured by dynamical mechanical spectroscopy. (18 refs.)

114863 Vibrational spectroscopic characterization of rigid rod polymers. IV. Crystalline modifications of poly(p-phenylene terephthalamide). D.Y.Shen, S.E.Molis, S.L.Hsu (Polymer Sci. & Engng. Dept., Univ. of Massachusetts, Amherst, MA, USA). *Polym. Eng. & Sci. (USA)*, vol.23, no.10, p.543-7 (July 1983). For pt.III see Polymer, vol.23, p.969 (1982). Infrared spectroscopy (4000-50 cm^{-1}) was used to characterize the two crystalline modifications of poly(p-phenylene terephthalamide). Polarized studies revealed that hydrogen bonds are oriented primarily perpendicular to the film plane in both forms. It was also found that the crystalline modification coagulated in water could be transformed into the other form by annealing at high temperatures. (23 refs.)

114864 Theory of Raman scattering from molecules adsorbed at semiconductor surfaces. H.Ueba (Dept. of Electronics, Toyama Univ., Toyama, Japan). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.328-46 (Sept. 1983). A theory is presented to calculate the Raman polarizability of an adsorbed molecule at a semiconductor surface, where the electronic excitation in the molecule site interacts with excitons (elementary excitations in the semiconductor) through nonradiative energy transfer between them, in an intermediate state in the Raman scattering process. The Raman polarizability thus calculated is found to exhibit a peak at the energy corresponding to a resonant excitation of excitons, thereby suggesting the possibility of surface enhanced Raman scattering on semiconductor surfaces. The mechanism studied here can also give an explanation of a recent observation of the Raman excitation profiles of p-NDMA and p-DMAAB adsorbed on ZnO or TiO_2 , where those profiles were best described by assuming a resonant intermediate state of the exciton transition in the semiconductors. It is also demonstrated that in addition to vibrational Raman scattering, excitonic Raman scattering of adsorbed molecules will occur in the coupled molecule-semiconductor system, where the molecular returns to its ground electronic state by leaving an exciton in the semiconductor. A spectrum of the excitonic Raman scattering is expected to appear in the semiconductor. A spectrum of the excitonic Raman scattering is expected to appear in the background of the vibrational Raman band and to be characterized by the electronic structure of excitons. A desirable experiment is suggested for an examination of the theory. (37 refs.)

114865 Theory of charge transfer excitation in surface enhanced Raman scattering. H.Ueba (Dept. of Electronics, Toyama Univ., Toyama, Japan). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.347-66 (Sept. 1983). On the basis of a recently proposed energy diagram of pyridine chemisorbed on Ag, a simple theory is presented to calculate the Raman scattering polarizability of an adsorbed molecule on a metal surface, where charge transfer excitation participates as intermediate state of the Raman process. The charge transfer excitation is assumed to occur from the metal to an unoccupied electron affinity level of the adsorbed molecule. Using a simple version of the Newns-Anderson model (1969) of chemisorption, it is found that the Raman polarizability is substantially enhanced when the frequencies of the incident or Raman scattered photons become resonant with the charge transfer excitations of the coupled system. The degree of enhancement is found to be sensitive to position and broadening of the charge transfer state and also the width of the electronic band of the metal. A broadened Raman line is also expected due to the modified electron-phonon interaction of the adsorbed molecule. (46 refs.)

114866 Surface enhanced Raman scattering from pyridine on copper in UHV. U.Erturk, I.Pockrand, A.Otto (Physik. Inst. III, Univ. Dusseldorf, Dusseldorf, Germany). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.367-84 (Sept. 1983). The Raman spectra of pyridine on coldly deposited copper films show two groups of bands: one group originates from pyridine adsorbed at atomically smooth parts of the surface, this signal is enhanced mainly by electromagnetic resonances. The second group originates from pyridine at defect sites—where an additional enhancement of at least 2 orders of magnitude occurs. (56 refs.)

114867 An infra-red reflection absorption study of the adsorption of NO on Pt(111). B.E.Hayden (Fritz-Haber-Inst. Max-Planck-Gesellschaft, Berlin, Germany). *Surf. Sci. (Netherlands)*, vol.131, no.2-3, p.419-32 (Sept. 1983). The adsorption of NO on Pt(111) at 95K has been studied using infrared reflection absorption spectroscopy (IRAS) together with TPD and LEED. As in electron energy loss spectroscopy two vibrations in the NO stretch region are observed in the IRAS spectrum of adsorbed N^{14}O : a peak at 1476-98 cm^{-1} appears at low coverages but completely converts within a rather narrow coverage range ($0.12 > \theta > 0.16$) into a peak at 1700-25 cm^{-1} . The species giving rise to the latter band is associated with $p(2 \times 2)$ LEED pattern, and saturation coverage corresponds to a molecular NO coverage of $\theta = 0.25$. IRAS experiments involving isotopic mixtures of $\text{N}^{14}\text{O}/\text{N}^{15}\text{O}$ indicate that the two NO vibrations are due to bridge and linearly bound species. Two alternative adsorption models recently proposed for this system appear to be incorrect. The mixed isotope experiments have also enabled the dipole and static contributions to the coverage-dependent frequency shift of both species to be separated. The dipole shift, while very small for the bridging species ($< 5 \text{ cm}^{-1}$), is 33 cm^{-1} for the linear species at $\theta = 0.25$. The bridging NO species exhibits a significant positive static shift ($\sim 18 \text{ cm}^{-1}$) while the static shift observed for the linear species is negative ($\sim 13 \text{ cm}^{-1}$). There is evidence that the presence of the linear species on the surface contributes to the static shift of the bridging species in the region in which the two species co-exist. (24 refs.)

114868 Photoabsorption effect in diamagnetic exciton spectra of InSb crystals. S.I.Kokhanovskii, Yu.M.Makushenko, R.P.Seisyan (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.312-12 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.501-3 (March 1983). [received: Sept. 1983] The authors carried out an experiment designed to detect the photoabsorption in InSb subjected to a magnetic field. Background illumination was provided by an He-Ne laser emitting at $\lambda = 3.39 \mu$, the radiation of which was interrupted at a frequency of $\Omega = 450 \text{ Hz}$. (8 refs.)

114869 Raman scattering in $\text{Bi}_{12}\text{Ti}_{20}$. Yu.G.Zaretskii, G.A.Kurbatov, V.V.Prokofev, Yu.I.Ukhanov, Yu.V.Shmartshev (M.I. Kalinin Polytech. Inst., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.339-4 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.596-8 (Feb. 1983). [received: Sept. 1983] The authors have studied the Raman spectra of single-crystal $\text{Bi}_{12}\text{Ti}_{20}$ at $T \approx 80\text{K}$ and $T \approx 10\text{K}$. An attempt was made to calculate the intrinsic vibrational frequencies of the submolecular group $\text{O}_{(2)}\text{Bi}_3$ in $\text{Bi}_{12}\text{Ti}_{20}$ by the method of Babonas et al. (1982). (14 refs.)

- 114870 Raman scattering of light in N activated CdS crystals.** Yu.P.Gnatenko, P.A.Skubenko, A.Kh.Rozhko. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.8, p.1257-8 (Aug. 1983). In Russian. Investigates the Raman scattering spectra of CdS:N crystals at T=300K. The spectra were used to obtain data on the appearance, in the low-frequency region of the spectrum (to 50 cm⁻¹), of oscillations due to the impurity as well as oscillations active in the Jahn-Teller interaction process. (6 refs.) N.G.P.
- 114871 Non destructive optical analysis of implanted layers in GaAs by Raman scattering and spectroscopic ellipsometry.** J.Biellmann, B.Prevot, C.Schwab (Lab. de Spectroscopie et d'Optique du Corps Solide, Strasbourg, France), J.-B.Theeten, M.Erman. Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.517-22. Non destructive analysis by Raman Scattering (RS) and Spectroscopic Ellipsometry (SE) is demonstrated on B⁺ and Se⁺ shallow implanted GaAs. Qualitative informations are obtained from 1st and 2nd order RS spectra. The former are analysed using the intensity ratio of the TO and LO modes, which defines a lattice potential perfection scale. The SE analysis of the E₁, E₁+Δ₁ structure in the imaginary part of the dielectric function conforms the RS results and its multilayer analysis yields the depth profile of the implanted ions. 78.35 BRILLOUIN AND RAYLEIGH SCATTERING

- 114872 Brillouin scattering in liquid benzene under high pressure.** A.Asenbaum (Max-Planck-Inst. für Festkörperforschung, Stuttgart, Germany), H.D.Hochheimer. *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.980-6 (Sept. 1983). Brillouin spectra have been measured in liquid benzene at high pressures up to 1300 bar and at the temperatures 298.15K, 313.15K, 323.15K, and 343.15K. From the experimental spectra the hypersound velocities and the energy relaxation times were determined. The total velocity dispersion v_{ph}^2/v_0^2 due to the relaxation of the vibrational specific heat c_v is found to be nearly density independent in the pressure interval under study. It follows further that the experimentally determined specific heat corresponds to the theoretical value calculated with the vibrational modes of the benzene molecule. The energy relaxation time τ_1 connected with all vibrational modes but the lowest decreases with increasing density at constant temperature, at constant density τ_1 decreases with growing temperature. The relative relaxation rates were used to test the cell model (CM) with movable walls and the collision theory (HS) of Einwohner and Alder (1968). Using a hard sphere diameter derived from experimental transport coefficients the experimental results were predicted better by HS than by CM. (49 refs.)

78.40 VISIBLE AND ULTRAVIOLET SPECTRA

- 114873 Photoacoustic spectra of MoS₂.** K.D.Carlson, D.Hodul (Argonne Nat. Lab., Argonne, IL, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2893-6 (15 Sept. 1983). The photoacoustic spectra of powdered MoS₂ prepared by particle-size reduction and dilution have been determined and compared with the optical transmittance spectra of single crystals and thin-film deposits. MoS₂ was chosen as a typical representative of the layer-structure transition metal dichalcogenides for which optical properties are important in explaining their unusual structural and transport properties. Reasonably well-resolved photoacoustic spectra were obtained by a layering technique using KCl as a diluent. Analysis of the experiments indicated that the spectral resolution was obtained not by reduction in photoacoustic signal saturation but by the enhancement of diffuse reflectance. (14 refs.)
- 114874 The diffuse reflectance spectra of mono-cadmium and di-cadmium stannates.** F.Golestani-Fard, C.A.Hogarth (Dept. of Phys., Brunel Univ., Uxbridge, England), D.N.Waters. *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.505-10 (Sept. 1983). Following the work of A.J. Nozik (1972), the authors measured the spectral dependence of diffuse reflectance and provide evidence of a well-defined fundamental absorption edge which is different for the two materials (CdSnO₃ and Cd₂SnO₄). (10 refs.)
- 114875 The lowest triplet state of tetramethyl-1,3-cyclobutanedithione. I. Single-crystal polarized absorption spectrum.** J.Baiardo, M.Vala (Dept. of Chem., Univ. of Florida, Gainesville, FL, USA), I.Trabjerg. *Chem. Phys. (Netherlands)*, vol.79, no.3, p.391-402 (15 Sept. 1983). The single-crystal polarized absorption spectrum of tetramethyl-1,3-cyclobutanedithione (TMCBNDT) has been measured in the region of the lowest triplet state. All bands are polarized exclusively perpendicular to the tetragonal unit cell c axis. The 0-0 band which lies at 594.3 nm is the most intense feature with active vibrations at 309, 329, 600, 913, and 969 cm⁻¹ of lower intensity. The electronic transition is assigned to ³A_g←A_g (π*) in the D_{2h} molecular point group. Weak, low-frequency vibrations (<100 cm⁻¹) observed near the origin band (and several other vibronic bands) have been analyzed using a model in which the excited triplet and ground electronic states are described by double-minimum potentials (DMPs). The parameters for these states were found by fitting the low-temperature (1.6K) absorption and emission crystal spectra using the Coon, Naugle, and McKenzie (1966) method. A 23 cm⁻¹ potential barrier is found for the ground state and a 95 cm⁻¹ one for the triplet state. (29 refs.)
- 114876 Experimental studies on reflection spectra in monodomain cholesteric liquid crystal cells: total reflection, subsidiary oscillation and its beat or swell structure.** H.Takezoe, Y.Ouchi, M.Hara, A.Fukuda, E.Kuze (Dept. of Textile & Polymeric Materials, Tokyo Inst. of Technol., Tokyo, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.7, p.1080-91 (July 1983). Many optical properties are studied here in the reflection spectra for monodomain cholesterics of various cell thicknesses at various angles of incidence. It is reported for the first time that left-circularly polarized light incident on a left-handed helix gives rise to a beat structure in the subsidiary oscillation, while right-circularly polarized light causes a swell to be superimposed on the subsidiary oscillation. The beat structure is ascribed to the excitation of two sets of optical eigen modes, each set consisting of two optical eigen modes of slightly different wavelength. The polarization characteristics of the total

reflection band as well as the selective reflection band are also discussed. (18 refs.)

114877 Electronic absorption and emission spectra of binuclear platinum(II) complexes. Characterization of the lowest singlet and triplet excited states of $\text{Pt}_2(\text{H}_2\text{P}_2\text{O}_5)_4^{4-}$. S.F.Rice, H.B.Gray (Arthur Amos Noyes Lab., California Inst. of Technol., Pasadena, CA, USA). *J. Am. Chem. Soc. (USA)*, vol.105, no.14, p.4571-5 (13 July 1983). The low-temperature electronic absorption and emission spectra of single crystals containing a binuclear platinum anion, $\text{Pt}_2(\text{H}_2\text{P}_2\text{O}_5)_4^{4-}$, have been measured and analyzed. Absorption systems in the 450- and 360-nm regions are attributable to transitions to $d\sigma^*p\sigma$ excited states ($^3A_{2g}$ and $^1A_{2g}$, respectively). The Pt-Pt stretching frequency in the $^3A_{2g}$ state (155 cm^{-1}) is much larger than that (110 cm^{-1}) in the ground state (the $^3A_{2g}$ absorption as well as the fluorescence ($^1A_{2u} \rightarrow ^2A_{1g}$) and phosphorescence ($^3A_{2u} \rightarrow ^1A_{1g}$) spectra exhibit Pt-Pt stretching progressions), which accords with the $d\sigma^*p\sigma$ description of the excited state. The Pt-Pt bond is calculated to contract by 0.21 \AA in the $^3A_{2u}$ state (relative to the ground-state value of 2.92 \AA). Measurements of the phosphorescence spectrum of $\text{Ba}_2\text{Pt}_2(\text{H}_2\text{P}_2\text{O}_5)_4$ at low temperatures (8-4.2K) confirm that there are two emitting levels split by 40.9 cm^{-1} (origins at 476.55 and 477.48 nm are assigned to the E_g and A_{1u} spin-orbit components of $^3A_{2u}$). (17 refs.)

114878 Lanthanide hypersensitivity in various solution media. S.A.Davis (Dickinson Coll., Carlisle, PA, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.239-40 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). Summary form only given. The absorptive hypersensitive transitions of Nd^{3+} , Ho^{3+} , Er^{3+} and Eu^{3+} are examined under a variety of solution conditions. The hydrated chlorides of these lanthanides were dissolved (equimolar amounts) in various solvents. The solvents used (methanol, ethanol, dimethyl sulfoxide (DMSO), dimethylformamide (DMF) and water) all differ with regard to their dipole moments and polarizability. Each of the absorptive hypersensitive f-f transitions is observed to be composed of a set of crystal field 'bands' which are found to be at the same energies for each transition. As the solvent is changed, the intensities of these bands change. There appears to be a correlation between the increase in the intensity of some of these bands and the increase in polarizability. This is complementary to the observed correlation between the total oscillator strength and the polarizability. (no refs.)

114879 Picosecond dynamics of hot carrier relaxation in highly excited multi-quantum well structures. C.V.Shank, R.L.Fork, R.Yen, J.Shah (Bell Telephone Labs., Holmdel, NJ, USA), B.I.Greene, A.C.Gossard, C.Weisbuch. *Solid State Commun. (USA)*, vol.47, no.12, p.981-3 (Sept. 1983). Dynamics of hot carrier relaxation, exciton screening and subband level renormalization in GaAs-AlGaAs multiple quantum well structures are investigated by time resolved measurements of optical absorption and gain following subpicosecond optical excitation. The cooling rate of the electron hole plasma in these two dimensional structures is approximately the same as for bulk GaAs at comparable photoexcitation density. (6 refs.)

114880 Ni^{2+} pair spectra in the excited orbitally degenerate states. V.Ya.Mitrofanov, A.E.Nikiforov, A.N.Men (Inst. of Metall., Ural Sci. Centre, Sverdlovsk, USSR). *Spectrosc. Lett. (USA)*, vol.16, no.8, p.621-7 (1983). The main features of Ni^{2+} pair spectra in the excited orbitally degenerate nonmagnetic states (1E , 1T_2) caused by the vibronic and exchange interactions are considered. (6 refs.)

114881 Edge absorption and band gap of $\text{CuAl}_x\text{Ga}_{1-x}\text{Se}_2$ solid solutions. I.V.Bodnar, N.L.Gil, A.I.Lukomskii (Inst. of Solid-State & Semiconductor Phys., Acad. of Sci., Minsk, Belorussian SSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.333-4 (March 1983). Translation of: *Fiz. i Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.530-2 (March 1983). [received: Sept. 1983] Ternary semiconductor compounds CuAlSe_2 and CuGaSe_2 crystallize in the chalcopyrite structure. They have attracted attention because of potential applications in nonlinear optics and optoelectronic devices. The optical properties of these compounds have been investigated in the region of the fundamental absorption edge. However, such investigations have not yet been carried out on solid solutions based on these compounds. The authors' aim was to determine the absorption spectra of $\text{CuAl}_x\text{Ga}_{1-x}\text{Se}_2$ solid solutions in the spectral range adjoining directly the fundamental absorption edge, and to determine the nature of the composition dependence of the band gap. (8 refs.)

114882 Optical properties of ferroelectrics with tetragonal potassium-tungsten-bronze in the fundamental absorption region. A.A.Mamedov (Azerbaijani State Univ., Baku, Azerbaijan SSR). *Sov. Phys.-JETP (USA)*, vol.83, no.5, p.1043-9 (Nov. 1982). Translation of: *Zh. Eksp. i Teor. Fiz. (USSR)*, vol.83, no.5, p.1804-15 (Nov. 1982). [received: Sept. 1983] The reflection spectra of ferroelectrics with the structure of tetragonal potassium-tungsten bronze ($\text{Ba}_2\text{Sr}_{1-x}\text{O}_6$ and $\text{Ba}_2\text{NaNb}_2\text{O}_{15}$) are investigated at energies $\hbar\omega=1.0$ to 35 eV . The results are used to calculate the optical function, to propose an interband-transition energy scheme, and to demonstrate the important role of the NbO_6 octahedron in the formation of the band structure of the crystals. 78.45 STIMULATED EMISSION

(see also 42.65C in nonlinear optics)

114883 Stimulated Raman emission of coherent phonons by impurities in a crystal. B.Fain (Dept. of Chem., Tel-Aviv Univ., Ramat Aviv., Tel-Aviv, Israel).

J. Appl. Phys. (USA), vol.54, no.9, p.4832-40 (Sept. 1983). The possibility of stimulated emission of coherent phonons by impurities (ions) embedded in a crystal is considered. It is shown that when the ions with homogeneously broadened levels are subjected to an electromagnetic field, the frequency Ω of which is larger than an eigenfrequency of the ion ω_{21} , at the Raman frequency $\omega_0 = \Omega - \omega_{21}$, a coherent stimulated emission of phonons may emerge. The absorption rate of the pumping electromagnetic field has a singularity near the threshold of the phonon self-excitation. (10 refs.)

78.50 IMPURITY AND DEFECT ABSORPTION IN SOLIDS

114884 Al-induced enhancement colouration by gamma irradiation in some borate glasses. A.M.Nassar (Phys. Dept., Nuclear Res. Centre, Cairo, Egypt), M.M.Morsi, M.A.Adawi.

Atomkernenerg. Kerntechnik. (Germany), vol.42, no.2, p.117-19 (1983). Potassium borate and potassium-alumino-borate glasses were prepared and exposed to gamma radiation. Optical transmission studies show that an absorption band is induced at 802-830 nm in binary potassium borate and Al-containing glasses, respectively. The presence of induced bands at 525 and 484 nm is recorded in the latter glasses only. A postulate for the centres responsible for the observed absorption bands is given. The long wavelength band (802-830 nm) is attributed to electron trapped centres on boron atoms co-ordinated with three bridging oxygen atoms and stabilized by alkali ions nearby. The bands at 525 and 484 nm were attributed to trapped hole centers at AlO_4 units. The holes trapped on these units are of different modes. (14 refs.)

114885 Excitation spectrum of neutral and singly ionized beryllium acceptors in germanium. L.T.Ho, J.W.Cross, A.K.Ramdas (Dept. of Phys., Purdue Univ., Lafayette, IN, USA), R.Sauer.

Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan), vol.12, p.240 (Dec. 1982). [received: Sept. 1983] Beryllium, a group II impurity, enters germanium substitutionally, hence it is a double acceptor. Neutral Be^0 binds two holes and the excitation spectrum of $\text{Ge}(\text{Be}^0)$ shows lines with spacings close to those for the other group II impurities Zn and Hg and those recently observed for Mg. The authors have examined the $\text{Ge}(\text{Be}^0)$ with a high resolution Fourier transform spectrometer equipped with a liquid helium cooled bolometer. They have discovered that all the prominent lines are split into doublets with a spacing of 0.09 meV . They interpret this splitting as a consequence of closely spaced $\Gamma_1 + \Gamma_3 + \Gamma_5$ ground states. This ground state multiplicity is due to the double acceptor nature of Be^0 . When beryllium in germanium is suitably compensated it is possible to obtain singly ionized Be^+ , Be^- . The excitation spectrum of $\text{Ge}(\text{Be}^-)$ shows that the spacings of the lines are four times those of the corresponding lines in $\text{Ge}(\text{Be}^0)$. (no refs.)

114886 Excitation spectrum of magnesium acceptors in germanium. L.T.Ho, J.W.Cross, A.K.Ramdas (Dept. of Phys., Purdue Univ., Lafayette, IN, USA).

Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan), vol.12, p.241 (Dec. 1982). [received: Sept. 1983] Magnesium is an interstitial impurity in silicon (Si) with a T_d site symmetry. It exhibits an excitation spectrum characteristic of a shallow, 'He-like' double donor. With a view to exploring the behavior of Mg in germanium (Ge), the authors have diffused it into the pure crystal and examined its excitation spectrum. Ge crystal with the impurities diffused into it is p-type thus strongly indicating that unlike its behavior in Si, Mg is a double acceptor. The excitation spectrum measured on a Fourier transform spectrometer shows excitation lines very similar to that exhibited by $\text{Ge}(\text{Zn})$, $\text{Ge}(\text{Hg})$, and $\text{Ge}(\text{Be})$. The spacings of the lines, G, D, C, B, A, and A' for the various impurities are remarkably close; their relative intensities are also very similar. (no refs.)

114887 Ultraviolet A-band absorption in NaCl:Pb²⁺ and clustering of lattice defects. J.S.Dryden, R.G.Heydon (CSIRO Div. of Appl. Phys., Sydney, NSW, Australia).

J. Phys. C (GB), vol.16, no.27, p.5363-73 (30 Sept. 1983). Changes in the A-band absorption spectrum of NaCl:Pb²⁺, resulting from isothermal aging, have been analysed using information obtained from dielectric relaxation measurements about the state of aggregation of the Pb²⁺ ions and their associated vacancies. Optical absorption has been measured at room and liquid nitrogen temperatures. It is shown that the A band, centred at 4.54 eV for (Pb²⁺-vacancy) pairs, splits into two bands, when clusters of three (Pb²⁺-vacancy) units form during the first stage of aggregation. One band is at the same energy (4.54 eV) and the other at 4.34 eV. In the second stage of aggregation these trimer bands persist with no change in intensity, and two new bands appear at 4.66 eV and 4.34 eV. The significance of these measurements for models of the aggregation process is discussed. (14 refs.)

114888 Judd-Ofelt parameters and chemical bonding. C.K.Jorgensen, R.Reisfeld (Dept. de Chimie Minérale, Analytique et Appliquée, Univ. de Genève, Geneva, Switzerland).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.107-12 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The three Judd-Ofelt intensity parameters for erbium(III) are given in 17 different environments. The Ω_2 parameter is strongly affected by covalent chemical bonding. In contrast, the Ω_6 parameter is related to the rigidity of the medium in which the ions are situated. (45 refs.)

114889 Rationalization of the f-f intensity parameters for transitions between crystal field levels of lanthanide ions. M.F.Reid, F.S.Richardson (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.113-18 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The intensity parameters $A_{\lambda}\bar{\alpha}(r,\lambda)$, which are applied to electric dipole transitions between crystal field levels in lanthanide 4f-4f spectra, are shown to contain much more information regarding intensity mechanisms than do the Ω_{λ} parameters, which are applied to transitions between J multiplets. Within the context of the prevailing electrostatic models for 4f-4f electric dipole intensity, it is shown that the relative contributions of the static-coupling and dynamic-coupling mechanisms to the intensity parameters can be differentiated on the basis of the signs obtained for the various $A_{\lambda}\bar{\alpha}(r,\lambda)$. To illustrate this point, a set of intensity parameters (related to the $A_{\lambda}\bar{\alpha}(r,\lambda)$) are calculated for the Pr³⁺-LaAlO₃ system. The calculated results are then compared with the empirically determined intensity parameters reported for this system, and conclusions are drawn regarding the relative importance of the static-coupling and dynamic-coupling mechanisms. (19 refs.)

114890 Color centers and electron spin resonance in chrysoberyl containing Mn and Ti guest ions. V.P.Solntsev, V.N.Matrosov, E.G.Tsvetkov.

J. Appl. Spectrosc. (USA), vol.37, no.5, p.1319-22 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.839-43 (Nov. 1982). [received: Sept. 1983]

The work reported is concerned with a study of the ESR spectra and the optical electronic absorption spectra of Mn and Ti in chrysoberyl with the aim of establishing their valence state, coordination, and possible link with the color of the sample. The ESR lines were measured at a frequency of 9.3 GHz at 300 and 77K. The transmission spectra were recorded in polarized light on an SF-8 spectrophotometer at 300K using disks which had been cut out parallel to the {001}, {010}, and {100} edges. (10 refs.)

114891 Attenuation of optical irradiation by bismuth colloidal colour centres. I.S.Radchenko, Yu.A.Ekmanis.

Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.4, p.10-17 (1983). In Russian.

Calculation results for optical attenuation spectra and scattering of bismuth in the colloidal phase in the matrix of NaCl, KCl, KBr, KI, RbCl are reported. Comparison with experimental data allows the authors to interpret absorption bands of these centres taking into account their structure and shape. (22 refs.)

114892 Fundamental absorption edge of irradiated alkali halides. L.G.Grigor'eva, D.K.Millers.

Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.4, p.60-5 (1983). In Russian.

The fundamental absorption edge and the changes of intrinsic luminescence in NaCl, KCl, KBr and KI crystals irradiated at room temperature have been studied. It is shown that the radiation damage in the form of point defects as well as aggregated defects gives rise to perturbed exciton states. These perturbed exciton states are responsible for changes in the fundamental absorption edge and intrinsic luminescence spectra. The comparison of the fundamental absorption edge irradiated and unirradiated crystals can be used for studying the full annealing of radiation damages. (14 refs.)

114893 Two-photon absorption cross section at F₂⁺ centers of alkali-halide crystals. V.F.Kamalov, Yu.P.Svirko (Dept. of General Phys. & Wave Processes, Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.43-6 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.38-41 (1983).

The nonlinear optical susceptibilities of F₂⁺ centers in alkali-halide crystals are calculated. Values of the energy and dipole moments of transitions determined within the framework of the model of the molecular hydrogen ion allow the two-photon absorption cross section of a series of optical transitions. (9 refs.)

114894 Infrared absorption in proton-irradiated solid deuterium. R.L.Brooks, M.A.Selen, J.L.Hunt, J.R.MacDonald, J.D.Poll (Univ. of Guelph, Guelph, Ontario, Canada), J.C.Waddington.

Phys. Rev. Lett. (USA), vol.51, no.12, p.1077-80 (19 Sept. 1983).

The infrared absorption spectrum of solid D₂ at 4.2K has been studied with the sample irradiated by a 15-MeV proton beam. Three beam-induced spectral features have been observed. Comparison of these features with those previously seen in a sample doped with tritium conclusively establishes the presence and indicates the nature of a radiation-induced absorption process. After turning off the proton beam, these features persist for times of the order of hours; they can be quenched by heating the sample to ~11K. (7 refs.)

114895 Absorption spectrum of Cr³⁺ ion doped in lithium ammonium sulphate single crystal. S.V.J.Lakshman, T.V.Krishna Rao, K.Purandar (Dept. of Phys., SV Univ., Tirupati, India).

Solid State Commun. (USA), vol.47, no.12, p.993-5 (Sept. 1983).

The absorption spectrum of Cr³⁺ ion doped in lithium ammonium sulphate single crystal has been studied both at room (300K) and liquid nitrogen (77K) temperatures. From the nature and position of the observed bands, O_h symmetry is assumed for the ion. The spectroscopic parameters derived for

the ion in the crystal at 77K are D_q=1655 cm⁻¹, B=735 cm⁻¹ and C/B=4.4. (20 refs.)

114896 Spectrum of localized states near the fundamental absorption edge and likely mechanism of compensation of CdTe:Cl crystals. N.V.Agrinskaya, O.A.Matveev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.245-7 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.394-7 (March 1983). [received: Sept. 1983]

An investigation was made of the impurity absorption and photoconductivity in the part of the spectrum adjoining the fundamental edge. A distinguishing feature of grown CdTe:Cl crystals subjected to the process of self-purification was the low density of the impurity levels in the region far from the band gap edge, but near the edge of the valence band there were levels due to a high concentration ($\geq 2 \times 10^{16}$ cm⁻³) of acceptor centers with an ionization energy ~0.04 eV. Heat treatment in vacuum at 500°C increased the concentration of acceptors with deeper levels, which were vacancies (V_{Cd}) and complexes (V_{Cd}Cl). The likely compensation mechanism was analyzed and it was concluded that Frenkel pairs formed alongside Cl atoms in the course of self-purification. (7 refs.)

114897 Infrared-absorption of thermal donors in silicon. R.Oeder, P.Wagner (Heliotronic GmbH, Burghausen, Germany).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.171-5

Thermal donors generated in CZ-silicon by annealing at 450°C are investigated by infrared absorption spectroscopy. Up to nine double-donors can be distinguished due to their line spectra characteristic for effective-mass-like donors. Their number and their concentrations depend on the duration of the thermal treatment. The formation of the different donors is ruled by complicated kinetics. (12 refs.)

78.55 PHOTOLUMINESCENCE

114898 Optical studies of In_xGa_{1-x}As-GaAs strained multiquantum well structures. J.Y.Marzin, E.V.K.Rao (CNET, Bagneux, France).

Appl. Phys. Lett. (USA), vol.43, no.6, p.560-2 (15 Sept. 1983).

The authors present photoluminescence and absorption measurements on molecular beam epitaxy grown strained In_xGa_{1-x}As-GaAs multiquantum well structures. The absorption results are interpreted as excitonic transitions ($n=1$, $n=2$), while the room-temperature luminescence spectrum shows the corresponding subband to subband transitions, and the low-temperature luminescence spectrum exhibits only the $n=1$ excitonic line. (9 refs.)

114899 Radiative lifetime in semiconductors for infrared detection. R.G.Humphreys (Royal Signals & Radar Establ., Malvern, England).

Infrared Phys. (GB), vol.23, no.3, p.171-5 (May 1983).

The radiative lifetime of excess carriers calculated by W. van Roosbroeck and W. Shockley (1954) is re-examined. Due to reabsorption effects, this lifetime is an underestimate of what would be measured in the bulk. It is shown that this extension of the lifetime can be considered as effectively noiseless. The consequences of this for infrared detector operating temperatures are discussed, with the conclusion that the state of the art is much further from the fundamental limit than had been supposed and substantial further improvements are possible. (8 refs.)

114900 Evaluation of spectroscopic parameters for the Pr³⁺ ion in a laser liquid. S.V.J.Lakshman, S.Buddhudu (Dept. of Phys., S.V. Univ., Tirupati, India).

Indian J. Pure & Appl. Phys., vol.21, no.7, p.413-15 (July 1983).

Radiative lifetimes are predicted for the fluorescent ³P₁, ³P₀ and ¹D₂ levels of Pr³⁺ in the laser liquid SeOCl₂. Quantities such as squared reduced matrix elements, electric and magnetic dipole line strengths, total radiative transition probabilities and radiative relaxation rates which are required for lifetime calculations are also reported. (11 refs.)

114901 Improvement of photoluminescence of molecular beam epitaxially grown Ga_xAl_{1-x}In_{1-x-y}As by using an As₂ molecular beam. W.T.Tsang, J.A.Ditzenberger, N.A.Olsson (Bell Labs., Murray Hill, NJ, USA).

IEEE Electron Device Lett. (USA), vol.EDL-4, no.8, p.275-7 (Aug. 1983).

The authors report the use of an As₂ (instead of As₄) beam during molecular beam epitaxial (MBE) growth of Ga_xAl_{1-x}In_{1-x-y}As layers, lattice-matched to InP substrate. They also show that use of the As₂ beam improves the room-temperature photoluminescence intensities of both In_{0.53}Ga_{0.47}As and Ga_{0.39}Al_{0.08}In_{0.53}As epilayers with more significant improvement for the latter. The substrate temperature employed was ~580°C for both. (26 refs.)

114902 Characterization of polycrystalline electrodeposited CdSe photoelectrodes using photoluminescence spectroscopy. R.P.Silberstein, M.Tomkiewicz (Dept. of Phys., Brooklyn Coll., City Univ. of New York, New York, NY, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5428-35 (Sept. 1983).

The authors have utilized both photoluminescence (PL) and Raman spectroscopy to nondestructively study the surface of polycrystalline electrodeposited CdSe photoelectrodes as a function of surface preparation and aging procedures. The excitation energy dependence of the PL efficiency at 77K, which depends on surface band bending, is consistent with increased concentration of shallow levels in electrodeposited CdSe compared with single crystal material. No PL was observed for unannealed CdSe films; for annealed, unaged films the spectra at 77K were qualitatively similar to those of single crystals in that spectral features could be identified with the A exciton at 1.815 eV and with a donor-acceptor-pair band at 1.70 eV exhibiting photon replicas. The PL and Raman spectra of light-aged electrodes exhibit features which the authors identify with the formation of a surface layer of CdS and the presence of mixed compounds CdS_{1-x}Se_x, which are formed by chemical exchange with the polysulfide electrolyte during light-induced aging. The PL spectra at 4.2K for the unaged and dark-aged electrodes exhibit sharp lines in the vicinity of

1.81 eV which they identify as due to bound-exciton recombination, but which differ in energy from those exhibited by the light-aged film. (21 refs.)

114903 Spontaneous site reorientation in a mixed molecular crystal: tetracene in benzoic acid. H.B.Levinsky, D.A.Wiersma (Dept. of Phys. Chem., Univ. of Groningen, Groningen, Netherlands). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2677-82 (15 Sept. 1983). Absorption and fluorescence spectra of tetracene in a benzoic acid host crystal at 1.5K are presented. The fluorescence zero-phonon line is shifted by more than 800 cm^{-1} to the red of the maximum of the 120 cm^{-1} broad absorption origin. This shift is attributed to a lateral site reorientation of the guest upon excitation, permitted by the difference in size between the tetracene and the benzoic acid dimer it replaces. In addition, other features in the fluorescence spectrum are ascribed to photon tautomerization occurring in the host dimers in the vicinity of the guest. These features disappear upon deuteration of the host acid protons, while the magnitude of the red shift is virtually unchanged. (31 refs.)

114904 Alignment of solutes in stretched polyethylene. Determination of the five second and fourth moments of the orientation distribution of 2-fluoropyrene from polarized fluorescence. Additional evidence for the twisting of weak transition moments by the solvent environment. F.W.Langkilde, M.Gisin, E.W.Thulstrup, J.Michl (Dept. of Chem., Univ. of Utah, Salt Lake City, UT, USA). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2901-11 (21 July 1983). Measurements of linear dichroism and of polarized fluorescence of 2-fluoropyrene (2-F-1) in stretched linear low-density polyethylene (LLDPE) at 77K have been used to evaluate the two independent second moments, $\langle \cos^2 \theta \rangle$ and $\langle \cos^2 \theta \rangle$, as well as the three independent fourth moments, $\langle \cos^4 \theta \rangle$, $\langle \cos^4 \theta \rangle$, and $\langle \cos^4 \theta \rangle$, of the orientation distribution function. The results are used to discuss two previously proposed detailed models for the mechanism of the orientation of aromatics in stretched polyethylene. For pyrene (1) and 2-methylpyrene (2-Me-1), four of the five moments were obtained. In these two molecules the direction of the L_y transition moment does not coincide with the molecular short in-plane y axis, but shows a distribution of orientations within the molecular framework, revealed by a site-selection experiment. On the average, it is inclined approximately 40° and 20° away from the y axis in the two compounds, respectively. This behavior is ascribed to a symmetry-lowering perturbation by the environment, related to the Ham effect. (19 refs.)

114905 Laser-induced emission of $\text{CaF}_2\text{-Tb}^{3+}$ at room and low temperatures. J.Chrysoschoos (Dept. of Chem., Univ. of Toledo, Toledo, OH, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.73-80 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). Laser-induced emission spectra of $\text{CaF}_2\text{-Tb}^{3+}$ at room and low temperatures excited via the 4765, 4880 and 4965 Å lines of an argon ion laser consist primarily of two groups of emission lines which are dependent upon both the excitation wavelength and the temperature. Group I is obtained at all excitation wavelengths whereas group II is virtually missing from the emission spectra excited at 4765 Å. Based upon the Stark splitting of the emission spectra recorded and their comparison with appropriate emission spectra of Tb^{3+} in hosts of known symmetry, groups I and II are tentatively assigned to the C_{4v} and C_{3v} sites respectively of Tb^{3+} . (22 refs.)

114906 Luminescence properties and two-photon absorption of Gd^{3+} -doped LaCl_3 . C.Linares, P.Jung, G.Boulon, F.Gaume (Lab. de Physicochimie des Matériaux Luminescents, Univ. de Lyon I, Villeurbanne, France). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.89-96 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). A UV tunable dye laser was used to excite selectively the Stark components of the $^4F_{7/2}$ levels of Gd^{3+} in an LaCl_3 host. The results demonstrate the existence of three types of sites in this host, with energy transfer between the Gd^{3+} ions. In addition, an antiStokes emission from the $^6I_{7/2}$ level was observed for which a mechanism is proposed. (13 refs.)

114907 The variation in europium(III) and terbium(III) luminescence lifetimes with concentration in rare earth oxysulphide matrices. Y.Charrere, J.Dexpert-Ghys (Lab. des Elements de Transition dans les Solides, CNRS, Meudon Bellevue, France), M.Leskela, L.Niinisto. *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.103-5 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). The transient properties of the Eu^{3+} 5D_2 , 5D_1 , 5D_0 emitting levels in oxysulphide matrices at various doping concentrations were analysed under either charge transfer state or direct 5D_1 selective excitation using pulsed laser light. At low Eu^{3+} concentrations the data can be described in terms of the step process $^5D_2 \rightarrow ^5D_1 \rightarrow ^5D_0$. The decrease in the 5D_2 and 5D_1 lifetimes with concentration can be interpreted by cross-relaxation (Eu-Eu) processes, whereas the presence of an (unidentified) impurity in the phosphors is proposed to explain the concentration quenching of 5D_0 . This conclusion is supported by the observation of similar behaviour of Tb^{3+} 5D_4 emission in the same matrices which is attributed to Eu^{3+} ions acting as traps. (3 refs.)

114908 Synthesis and spectroscopic properties of the Sillen phases. O.K.Moune-Minn, L.Albert, P.Caro (Lab. des Elements de Transition dans les Solides, CNRS, Meudon Bellevue, France). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.143-50 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). The family of Sillen phases consists of compounds where layers of the quadratic complex cation $(\text{BiO})_2^{2+}$ alternate with layers of perovskite-like structures of the form $\text{A}_{n-1}\text{B}_n\text{O}_{3n+1}$. The authors synthesized compounds with $1 \leq n \leq 5$ containing titanium, niobium or tungsten as the other cations. The fluorescence spectrum of Eu^{3+} embedded in these matrices is very complicated in view of the various point sites occupied by the rare earth. The dye laser selective excitation technique enables three different point sites to be analysed. (15 refs.)

114909 Has the $(\text{LnO})_n^{n+}$ ($\text{Ln} \equiv \text{lanthanide}$) complex cation a spectroscopic 'fingerprint'? P.Porcher, P.Caro (Lab. des Elements de Transition dans les Solides, CNRS, Meudon Bellevue, France). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.151-6 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). The spectra of Eu^{3+} -doped oxyhalides, oxymolybdates and oxysulphates are compared. The $(\text{LnO})_n^{n+}$ ($\text{Ln} \equiv \text{lanthanide}$) complex cation not only constitutes the framework of the structure but also appears to characterize the optical spectrum, thus influencing the crystal field parameters derived from the data. (13 refs.)
